# APPLETONS' JOURNAL

OF

LITERATURE, SCIENCE, AND ART

*VOLUME FIRST,*

FROM NUMBER ONE, TO NUMBER TWENTY,

APRIL 3, TO AUGUST 14, 1869.

NEW YORK :  
D. APPLETON AND COMPANY,  
90, 92 & 94 GRAND STREET.  
1869.

## APPLETONS' JOURNAL.—VOLUME FIRST.

---

THE PUBLISHERS beg leave to announce that the first volume of APPLETONS' JOURNAL is closed with the twentieth number, in order that, by dividing the issues of the current year into two equal volumes, they may be enabled, for the convenience of both the subscribers and publishers, to date the commencement of the volumes, in the following years, on the first of January and of July. The second volume will close with the last issue in December, and the third volume begin under the date of Saturday, January 1, each volume from that period to consist of twenty-six numbers, this number being the issue for six months. The slight irregularity in the date of the first two volumes will not affect the present subscriptions, which are calculated by time, and not by volumes.

The Publishers avail themselves of this opportunity to announce the complete success of APPLETONS' JOURNAL, and to assure their subscribers and patrons that it has now a permanent place among the leading periodicals of the country.

The plan of uniting certain striking popular features, in illustrations and fiction, with a high range of literary and scientific papers, has been well received. In variety and range of material, in liberality of illustration, in the scope of topics discussed, in popular fiction, science, travels, and adventures, it is believed that few periodicals have covered so wide a space. It has been the design of the publishers to omit ordinary news, and all partisan or sectarian advocacy, but, on all subjects in the wide range of literature, science, art, and education, to avail themselves, as announced in the opening number, of all resources, original and selected, domestic and foreign, which could give interest and variety to its pages. To this end they have labored assiduously, and the remarkable favor with which the JOURNAL has been received has exhibited the public appreciation of their efforts.

The JOURNAL is printed on a sheet of the same size as that used by a large number of American journals, but is folded one time more; and, in addition to the regular sheet, fine steel-engravings, or large wood cuts, printed on tinted paper, accompany the numbers at regular intervals. This plan enables the publishers to embellish the JOURNAL with engravings, which, as a rule, are superior to the ordinary illustrations in pictorial sheets, and, at the same time, to devote nearly the entire space in the regular sheet to general literature—thereby securing, what is not ordinarily found, copious illustration, united with ample literary contents.

The distinctive features of the JOURNAL, the publishers are happy to say, have given it a special interest in the estimation of the public; and, that this good opinion may continue to be justified, no pains or expense will be spared to render APPLETONS' JOURNAL in every way valuable and attractive.

NEW YORK, *August*, 1869.

# INDEX TO VOL. I.

## A.

About Babies, 344.  
Academy of Design, National, 307.  
Adulteration and its Remedies (E. L. Youmans), 23.

## THE MAN WHO LAUGHS; OR, BY THE KING'S COMMAND.

BY VICTOR HUGO.

PRELIMINARY CHAPTERS.

I.—URSUS.

URSUS and Homo were fast friends. Ursus was a man; Homo was a wolf. Their dispositions were congenial. It was the man who had christened the wolf. Probably he had also chosen the name; having found *Ursus* good for himself, he had found *Homo* good for the beast. The association of this man and this wolf was profitable at fairs, at parish festivals, at the corners of streets where passers-by gather together, and wherever the people give way to their need of listening to nonsense and buying orvietan. This wolf, docile, and submissive with a good grace, was acceptable to the crowd. It is a pleasant thing to note the effect of taming. We take supreme delight in seeing all varieties of domestication. It is for this reason that so many persons watch the progress of royal processions.

Ursus and Homo went from square to square, from the public places of Canterbury to the public places of Glasgow, from county to county, from town to town. One market exhausted, they passed on to another. Ursus lived in a crib upon wheels, which Homo, sufficiently civilized, drew by day and guarded by night. When the road was difficult, in going up-hill, when there were too many ruts and too much mud, the man buckled the strap to his neck, and tugged away fraternally, side by side with the wolf. In this fashion they had grown old together. They camped out, according to chance, on a bit of waste ground, at the intersection of crossing roads, at the approach to a hamlet, at the gates of market-towns, in the market-places, in the public malls, on the skirts of a park, on the space before a church. When the tilted cart stopped in some field where a fair was held, when the gossiping old women hurried up open-mouthed, when the cockneys drew round them in a circle, Ursus speechified and Homo approved. Homo, with a wooden bowl in his jaws, politely made a collection. They gained their livelihood. The wolf was lettered, and the man too. The wolf had been trained by the man, or had trained himself alone, to various pretty wolfine ways that augmented their receipts. "Above all things," said his friend to him, "don't degenerate into man!"

The wolf never bit, the man did bite sometimes. Ursus, at least, had the pretension of biting. He was a misanthrope, and, by way of making his misanthropy conspicuous, he had become a juggler. For means of living also, as the stomach imposes its conditions. Furthermore, this misanthropical juggler, whether to complicate or to complete his acquirements, was a doctor. A doctor—that's not much; Ursus was a ventriloquist. He was seen to speak without movement of the lips. He borrowed, so as to mislead any one, the accent and pronunciation of the first comer; he imitated voices, so that one thought the very persons were speaking. By himself alone, he gave out the breathing and murmur of a crowd, which justified him in taking the title of *Engastrimythe*. He took it. He imitated all sorts of birds' cries, the thrush, the reed-bird, the chirping lark, the white-breasted blackbird, all ramblers like himself, so that, by instants, he made you listen, at his option, either to some public resort, filled with the hum of human noises, or to a meadow filled with the chant of birds; now stormy as a multitude, now playful and serene as the dawn. However, this peculiar talent, though rare, does exist. In the last century, a man named Touzel, who imitated the mingled clamor of men and of animals, and who reproduced all the cries of beasts, was attached to the person of Buffon, as though himself a menagerie. Ursus was sharp and inquisitive, having more in him than appeared, and was prone to those peculiar explanations that we call fables. This boldness was a part of his roguery. He examined the hand of certain persons, or took hold of books at hap-hazard, and drew conclusions, predicted fortunes, taught that it is dangerous to meet a black mare, and more dangerous still to hear one's self called, at the moment of setting out upon a journey, by some one who does not know where you are going; and he entitled himself a "dealer in superstition." He said: "There is this difference between the Archbishop of Canterbury and myself: for my part, I speak out plainly." Thus it was that the archbishop, justly irritated, sent for him one day; but Ursus, adroit, disarmed his grace by reciting to him a sermon that he, Ursus, had made upon the holy day of Christmas, and which the archbishop, charmed by it, learned by heart, preached from the pulpit, and published as his own composition. In view of this, he forgave.

Ursus, being a doctor, effected cures, because or in spite of this fact. He practised in aromatics. He was versed in simples. He derived advantage from the immense power that there is in a heap of neglected plants, the hazel-tree, the medley-tree, the wayfaring-tree, the purging thorn, the sweet briony, the buckthorn. He treated consumption by sun-dew; he used for it the leaves of wart-wort, which torn downward

Entered, according to Act of Congress, in the year 1869, by D. APPLETON & CO., in the Clerk's Office of the District Court of the United States for the Southern District of New York.

are a purgative, and torn upward produce vomiting. He relieved you of a sore throat by means of a vegetable excrescence called jew's ear. He knew the sort of rushes that cure an ox, and the sort of mint that cures a horse. He was conversant with the beauties and the virtues of the herb mandragora, which, every one knows, is of masculine and feminine sex. He had receipts. He cured burns with salamander wool, whereof, according to Pliny, Nero owned a napkin. Ursus possessed a retort and a mattress; he dabbled in transmutation; he sold panaceas. It was said of him that he had formerly been for a while confined in Bedlam; they had done him the honor to take him for a madman, but they had let him go, perceiving that he was only a poet. This story, probably, was not true; we have, all of us, to undergo some such imputations.

The truth is, that Ursus was a pedantic scholar, a man of taste, and an old Latin poet. He was learned in two ways: he Hippocratized and he Pindarized. He might have competed in fustian with Rapin and Veda. He would have composed jesuitical tragedies in a style not less triumphant than Father Bonhours. From his familiarity with venerable rhythms and antique metres, it resulted that he had his own peculiar images, and a whole cloud of classic metaphors. He said of a mother, preceded by her two daughters, "This is a dactyl;" of a father, followed by his two sons, "This is an anapest;" and of a little child, walking between its grandfather and grandmother, "This is an amphimacer." So much science could only result in starvation. The school of Salerno said: "Eat little and often!" Ursus eat little and seldom, obeying thus one-half the precept, and disobeying the other half; but this was the fault of the public, which did not always flock round him, and did not purchase frequently. Ursus used to say: "The expectoration of a sentence is a solace. The wolf is consoled by howling, the sheep by its wool, the forest by its warblers, woman by love, and the philosopher by epiphonema." Ursus, at need, manufactured comedies, that he played—after a fashion; this aids in disposing of drugs. He had, among other works, composed an heroic pastoral in honor of Sir Hugh Middleton, who, in 1698, transported a river to London. This river was tranquil in the county of Hertford, sixty miles off. Sir Hugh Middleton came and took it. He brought with him a brigade of six hundred men armed with shovels and pickaxes; set himself to shaking up the earth, hollowing it here, throwing it up there, sometimes twenty feet high, sometimes thirty feet deep; made wooden aqueducts in the air, and in this place and that eight hundred bridges, of stone, of brick, of joists; and, one fine morning, the river entered into London, which lacked water. Ursus transformed all these vulgar details into a fine eclogue between the stream Thames and the river Serpentine; the stream invited the river to come to him, and offered her his bed, and said to her: "I am too old to please the women, but I am sufficiently rich to pay them"—an ingenious and gallant mode of expressing that Sir Hugh Middleton had executed all these works at his own expense.

Ursus was remarkable in a soliloquy. In look, morose at once and garrulous, having no desire to see any one, and craving to address some one, he got out of the difficulty by speaking to himself. Whoever has lived alone knows to what extent the monologue is natural. There is an itching in language repressed. To harangue space is an issue for it. To speak aloud, and all alone, has the effect of a dialogue with the god that one has within one's self. This, it is well known, was the custom of Socrates. He harangued himself; the same with Luther. Ursus was akin to these great men. He had this hermaphroditic faculty of being his own audience. He made inquiries of himself, and responded; he glorified and he insulted himself. His monologue in his crib might be heard from the street. Passers-by, who have their own special manner of appreciating clever fellows, said of him: "He is an idiot." He insulted himself sometimes, as we have just remarked; but he had

also his periods for doing himself justice. One day, in one of his self-addressed allocutions, he was heard to exclaim: "I have studied vegetable life in all its mysteries, in the stem, in the bud, in the sepal, in the petal, in the stamen, in the carpel, in the ovule, in the urn, in the conceptacle, and in the thalamus. I have fully probed chromatics, and osmosis, and chymosium, that is to say, the formation of color, of smell, and of taste." There was, without doubt, some foolishness in this certificate that Ursus delivered to Ursus; but let those who have not fully probed chromatics, and osmosis, and chymosium, cast at him the first stone.

Fortunately, Ursus never went into the Netherlands. They would certainly have desired to weigh him there, to ascertain whether he was of the normal weight, above or below which a man is a sorcerer. This weight, in Holland, was wisely fixed by the law. Nothing could be more simple and more ingenious. It was a verification. You were placed in wooden scales, and the evidence was conclusive if you disturbed the equilibrium: too heavy, you were hanged; too light, you were burned. There are still to be seen, at Oudewater, the scales for weighing sorcerers, but they serve now for weighing cheese, so much has religion degenerated! Ursus would certainly have had a crow to pluck with them. In his journeyings he avoided Holland, and he did well. In fact, we believe that he never went out of Great Britain.

Be that as it may, being very poor and very proud, and having made the acquaintance of Homo in a forest, a taste for wandering life came upon him. He had taken this wolf in as a sleeping partner, and he had taken the road with him, living, in the open air, the grand life of chance. He had much industry, and many by-ends, and great skill in all things connected with curing, operating, getting people out of their maladies, and accomplishing most wonderful specialties; he was considered a good mountebank and a good doctor; he passed also, one may understand, for a magician—in a moderate way, not too much of it—for in those days it was not wholesome to be set down as one of the devil's friends. To tell the truth, Ursus, by his passion for pharmacy and love of plants, exposed himself to danger—considering how often he went to gather herbs in the tangled thickets, where are Lucifer's salads, and where one risks, as has been attested by the Councillor De l'Ancre, meeting in the mist of the evening a man who rises out of the ground, "blind of his right eye, without cloak, a sword at his side, feet naked and unshod." Ursus, nevertheless, although queer in his conduct and temperament, was too sensible a man to draw down or keep off a hail-storm; to cause faces to appear; to kill a man with the torment of too much dancing; to suggest dreams pleasant, or sad and full of terrors; to cause the hatching of a four-winged cock. He did not pretend to these sorry tricks. He was incapable of certain abominations; as, for example, of speaking German, or Hebrew, or Greek, without having learned it, which is an indication of most execrable wickedness, or of a natural malady growing out of some melancholy caprice. If Ursus spoke Latin, it was because he knew it. He would never have allowed himself to speak Syriac, seeing that he knew it not; besides, it is averred that Syriac is the language of the witches' night assemblies. In medicine, he properly preferred Galen to Cardan—Cardan, all learned man that he is, being only an earth-worm in comparison with Galen.

To sum up, Ursus was not a personage molested by the police. His crib was sufficiently long and sufficiently broad, so that he could lie down there on a chest that contained his not oversumptuous wardrobe. He owned a lantern, several wigs, and various utensils hung up from nails, and among them some musical instruments. He possessed also a bear-skin, with which he covered himself on the days of a grand performance, calling this the putting on his costume. He said: "I have two skins; this is the true one," and he pointed to the skin of the bear. The crib on wheels belonged to him and the wolf. In

addition to his crib, his horn, and his wolf, he had a flute and a *viol di gamba*, and he played agreeably upon them. He manufactured his own elixirs. He wrought out of his talents enough to bring him an occasional supper. There was in the roof of his crib a hole, through which passed the pipe of a casting-stove alongside of his chest. This stove had two compartments. Ursus cooked up his alchemy in one, and his potatoes in the other. At night, the wolf slept under the crib, chained up in a friendly way. Homo had black hair, and Ursus gray hair. Ursus was fifty years old, if he were not sixty. His acceptance of human destiny was such, that he eat, as is perceived, potatoes—filthy food, upon which at that period swine and convicts were fed. He eat this, indignant, yet resigned. He was not tall, he was long. He was bent, and gloomy. The bowed-down figure of the old man—this is the subsidence of life. Nature had designed him to be sad. It was difficult for him to smile, and it had always been impossible for him to weep. He lacked the consolation of tears, and the palliative of joy. An aged man is a thinking ruin; Ursus was that ruin. A charlatan's loquacity, a prophet's leanness, the irascibility of a mine that is charged—such was Ursus. In his youth he had been a philosopher at the home of a lord.

This passed, a hundred and eighty years ago, in the days when men were a little more like wolves than they are at present.

Not much more.

## II.

Homo was not the first wolf that came to hand. From his appetite for medlars and apples, one would have taken him for a prairie wolf; from the deep color of his hair, one would have taken him for a lycaon; and from his howling toned down to a bark, one would have taken him for a Chilian dog; but the pupil of this animal's iris has not yet been so accurately observed, as to make it certain that he is not a fox, and Homo was a thorough wolf. His length was five feet, which is extreme length for a wolf, even in Lithuania. He was very powerful; he squinted, which was not his fault; he had a soft tongue, with which he sometimes licked Ursus; he had a stiff tuft of short black hair upon his backbone, and he was lean as any beast of the forest. Before making acquaintance with Ursus, and having a cart to drag, he did easily his forty leagues in a night. Ursus, falling in with him in a thicket, near a stream of running water, had taken a fancy to him, on seeing him fish for crawfish knowingly and prudently, and had welcomed in him an honest and genuine Koupava wolf, of the same kind as the crab-eating dog.

Ursus preferred Homo, as a beast of burden, to an ass. To make an ass draw his crib would have been repulsive to him; he set too high a value upon the ass for that. Besides, he had remarked that the ass, a four-footed thinker, little understood of men, has sometimes an unquiet pricking up of the ears, when philosophers say foolish things. In life, between our thoughts and ourselves, an ass is a third party; this is annoying. As a friend, Ursus preferred Homo to a dog, believing that the wolf's approach to friendliness is from a greater distance.

This is why Homo sufficed to Ursus. Homo was for Ursus more than a companion; he was an analogue. Ursus tapped him on his lean flanks with the remark: "I have found my second volume."

He said furthermore: "When I am dead, whoever desires to know me, will only have to study Homo. I shall leave him after me as my exact copy."

The English law, by no means tender toward the beasts of the forest, might have taken offence at this wolf, and have found fault with him for his impudence in going familiarly into towns; but Homo took advantage of the immunity accorded by a statute of Edward IV., touching "domestics:" "Every

domestic following his master shall be allowed to come and go freely." A certain relaxing as regards wolves had also resulted from a fashion among court-ladies, under the later Stuarts, that of having little Tartar foxes called Adives, no bigger than cats, which they had brought for them from Asia at heavy expense.

Ursus had communicated to Homo a portion of his talents, the standing upright, the tempering his rage into ill-humor, the grumbling in place of howling, etc.; and, on his part, the wolf had taught the man what he knew, the dispensing with a home, the dispensing with bread, the dispensing with fire, the preference of hunger in a wood to slavery in a palace.

The crib, a sort of cabin-carriage that followed the most varied itinerary, without however going out of England and Scotland, had four wheels, plus shafts for the wolf, and a swing-bar for the man. This swing-bar was a provision against bad roads. The carriage was solid, though constructed of light planks. It had, in front, a glass door, with a little balcony used for harangues—a tribune modified from a pulpit—and, in the rear, a full door pierced with a window. The lowering of steps—there were three of them—turning on a hinge and arranged behind the windowed door, gave entrance into the crib, well secured at night with bolts and locks. It had been much rained upon and snowed upon. It had been painted; but it were hard to say of what color, the changes of the seasons being for tilted carts what changes in a reign are for courtiers. In front, outside, upon a sort of deal-board frontispiece, one might formerly have deciphered this inscription in black letters upon a white ground, that had become by degrees confounded and mixed:

"Gold loses annually by friction one fourteen-hundredth of its bulk; this is what is called the wear and tear: thence it follows that, out of fourteen hundred millions of gold circulating throughout all the world, every year one million is lost. This million of gold goes off in dust, flies away, floats, is an atom, becomes breathable, loads, doses, burdens, and impairs the conscience, and amalgamates itself with the soul of the rich, which it renders proud, and with the soul of the poor, which it renders savage."

This inscription, effaced and erased by rain and by the goodness of Providence, was fortunately illegible; for it is probable that, being at once enigmatical and transparent, this philosophy of gold inhaled would not have suited the taste of sheriffs, provosts, and other wig-bearers of the law. English legislation at that time did not stand upon trifles. It was easy to be a felon. The magistrates showed themselves traditionally ferocious, and cruelty was the order of the day. Inquisitorial judges were multiplied. Jeffreys had left offspring.

## III.

WITHINSIDE the crib there were two other inscriptions. Above the chest, on the whitewashed partition of planks, might be read what follows, written in ink and by hand:

"THE ONLY THINGS THAT IT IS IMPORTANT TO KNOW.

"The baron peer of England has a circlet with six pearls.

"The coronet begins with the viscount.

"The viscount has a coronet of pearls not numbered; the earl, a coronet of pearls on spikes intermixed with strawberry-leaves lower down; the marquis, pearls and leaves of equal height; the duke, gems without pearls; the royal duke, a circlet of a cross and *fleurs-de-lys*; the Prince of Wales, a crown like that of the king, but not closed.

"The duke is most high and most mighty prince; the marquis and the earl, most noble and mighty lord; the baron, simply lord.

"The duke is your grace, the other peers are your lordships.

"The peers are inviolable.

"The lords are chamber and court, *concilium et curia*, legislature and justice."

"Most honorable" is more than 'right honorable.'

"The lords peers are qualified 'lords by right;' the lords not peers are 'lords by courtesy.' The only lords are those who are peers."

"The lord never takes an oath, neither before the king, nor in court of law. His word is enough. He says: 'Upon my honor.'"

"The Commons, who are the people, summoned to the bar of the Lords, present themselves there humbly, heads bare, before the peers who are covered."

"The Commons send up their bills to the Lords by forty members, who present the bill with three low bows."

"The Lords send their bills to the Commons by a simple clerk."

"In case of disagreement, the two Chambers confer in the painted chamber, the Peers seated and wearing their hats, the Commons standing up and uncovered."

"By a law of Edward VI., the lords have the privilege of simple homicide. A lord who only kills a man is not prosecuted."

"The barons have the same rank as the bishops."

"To be baron peer, one must hold of the king by *baroniam integram*, by barony entire."

"The barony entire is composed of thirteen fiefs noble and one quartering, each fief noble being of twenty pounds sterling, which amounts to four hundred marks."

"The chief thing in the barony, *caput baronia*, is a country seat, hereditarily governed, as England herself is; that is to say, incapable of being vested in daughters save in default of male children, and in this case going to the eldest daughter, *ceteris filiabus aliunde satisfactis*.\*"

"The barons have the title of *lord* from the Saxon *laford*, from the old Latin *dominus*, and from the lower Latin *lordus*."

"The elder and younger sons of viscounts and barons are the first esquires of the kingdom."

"The eldest sons of peers take precedence over knights of the Garter; the younger sons do not."

"The eldest son of a viscount walks behind all the barons, and before all the baronets."

"Every daughter of a lord is *lady*. Other English girls are *misses*."

"All the judges are inferior to the peers. The sergeant has a hood of lamb's skin; the judge has a hood of minever, *de minuto vario*, a mixture of small white furs of all sorts except ermine. Ermine is reserved for peers and for the king."

"A *supplicavit* cannot be granted against a lord."

"A lord cannot be kept in prison—except in the Tower of London."

"A lord summoned to the king's abode has the right to kill a stag or two in the royal park."

"The lord holds in his chateau a baronial court."

"It is unworthy of a lord to go into the streets, in a cloak, followed by two lackeys. He can only show himself with a large train of gentlemen of his household."

"The peers go to the Parliament-house in carriages, in file; the commons do not. Some peers go to Westminster in inverted chairs upon four wheels. The form of these chairs, and of their emblazoned and coronetted vehicles, is only allowed to the lords, and constitutes one of their privileges."

"A lord can only be condemned to a fine by his peers, and never to more than five shillings' fine—except a duke, who may be condemned to ten."

"A lord may have in his household six foreigners. Every other Englishman can only have four."

"A lord may have eight casks of wine, without paying duty."

\* "Which is the same as saying: 'One provides for the other girls as one can.'" (Note, by Ursus, on the edge of the wall.)

"The lord alone is exempted from presenting himself before the sheriff on circuit."

"The lord cannot be taxed for the militia."

"When a lord is so pleased, he raises a regiment, and presents it to the king; thus do their graces the Duke of Athol, the Duke of Hamilton, and the Duke of Northumberland."

"The lord holds only of lords."

"In a civil process, he may claim reference of the cause to another court, if there be not at least a knight among the judges."

"The lord appoints his own chaplains."

"A baron appoints three chaplains; a viscount four; an earl and a marquis five; a duke six."

"The lord cannot be put to the torture, even for high-treason."

"The lord cannot be branded on the hand."

"The lord is clerk, even when he knows not how to read. He knows it of right."

"A duke has a canopy carried with him wherever the king is not present; a viscount has a canopy in his house. A baron has one in readiness, and lets it be within his reach when he drinks; a baroness has the right to have her train borne by a man, when in presence of a viscountess."

"Eighty-six lords, or eldest sons of lords, preside at eighty-six tables of five hundred covers each, which are served every day to his Majesty in his palace, at the expense of the country surrounding the royal residence."

"A plebeian, who strikes a lord, has his wrist cut off."

"The lord is almost king."

"The king is almost God."

"The world is a lordship."

"The English address God as *my lord*."

Opposite this inscription, a second one might be read, written in the same style. Here it is:

"CONSOLATIONS THAT OUGHT TO SUFFICE FOR THOSE WHO HAVE NOTHING."

"Henry Anderquerque, Earl of Grantham, who sits in the House of Lords between the Earl of Jersey and the Earl of Greenwich, has an income of one hundred thousand pounds. It is to his lordship that the palace of Grantham Terrace belongs, built all of marble, and famous for what is called the labyrinth of corridors, which is a curiosity. There is in it the carnation corridor in Sarancolin marble, the brown corridor in Astracan lumachel, the white corridor in Lani marble, the black corridor in Alabanda marble, the gray corridor in Staremme marble, the yellow corridor in marble from Hesse, the green corridor in marble from the Tyrol, the red corridor half in Bohemian griotte, and half in Cordovan lumachel, the blue corridor in turquin from Genoa, the violet corridor in Catalonian granite, the mourning corridor, veined in black and white, in Murviedro schist, the rose corridor in cipolin from the Alps, the pearl corridor in Nonetta lumachel, and the corridor of all colors, called the courtiers' corridor, in harlequin braccio."

"Richard Lowther, Viscount Lonsdale, owns Lowther in Westmoreland, which is sumptuous in its approaches, and the door-steps of which appear to invite kings to enter."

"Richard, Earl of Scarborough, Viscount and Baron Lumley, Viscount of Waterford in Ireland, Lord-Lieutenant and Vice-Admiral of the county of Northumberland, and of Durham city and county, owns the double castle of Stansted, the ancient and the modern; where may be admired a superb railing in a half circle, surrounding a basin of water with an incomparable jet. He has, in addition, his chateau at Lumley."

"Robert Darcy, Earl of Holderness, has his domain of Holderness, with baronial towers, and gardens of immense extent in the French style, where he takes the air in a carriage with six horses, preceded by two outriders, as befits an English peer."

"Charles Beauchlerk, Duke of St. Albans, Earl of Burford,

Baron Haddington, Grand Falconer of England, has a residence at Windsor, a royal one, and near to that of the king.

"Charles Bodville, Lord Robartes, Baron Truro, Viscount Bodmin, owns Wimple, in Cambridgeshire, which is made up of three palaces with three pedimented fronts, one arched and two triple-angled. The approach is through a quadruple avenue of trees.

"The most noble and most mighty lord, Philip Herbert, Viscount of Cardiff, Earl of Montgomery, Earl of Pembroke, peer and lord of Candall, Marmion, St. Quentin, and Churland, Warden of the Stanneries in the counties of Cornwall and Devon, Hereditary Visitor of Jesus College, owns the marvellous garden of Wilton, where there are two water-basins with wheat-sheaf jets, finer than any at Versailles, of the most Christian king Louis XIV.

"Charles Seymour, Duke of Somerset, has Somerset House on the Thames, which equals the Villa Pamphili at Rome. There may be seen, upon the grand chimney-piece, two porcelain vases of the dynasty of the Yuens, which are worth half a million in French money.

"In Yorkshire, Arthur, Lord Ingram, Viscount Irwin, has Temple-Newsham, where you enter by a triumphal arch, and where the broad flat roofs resemble Moorish terraces.

"Robert, Lord Torrens of Chartley, Bouchier, and Lorraine, has, in Leicestershire, Staunton-Harold, where the park, geometrically laid out, has the form of a temple with a pediment; and the large church, with square bell tower, in front of the sheet of water, is also his lordship's.

"In the county of Northampton, Charles Spencer, Earl of Sunderland, one of his Majesty's privy council, possesses Althorp, where you enter through a railing with four pillars, surmounted by groups in marble.

"Lawrence Hyde, Earl of Rochester, has, in Surrey, New-Park, magnificent with its sculptured blocking-course, its circular lawn surrounded by trees, and its woods, at the end of which is a little mountain artistically rounded, and crowned with a towering oak visible a long way off.

"Philip Stanhope, Earl of Chesterfield, owns Bretby, in Derbyshire, which has a superb clock-tower, falconries, warrens, and very beautiful sheets of water, oblong, square, and oval, with two jets of great height.

"Lord Cornwallis, Baron of Eye, has Brome Hall, which is a palace of the fourteenth century.

"The most noble Algernon Capel, Viscount Malden, Earl of Essex, owns Cashiobury, in Hertfordshire, a chateau that has the form of a capital H, and where there are preserves well stocked with game.

"Charles, Lord Ossulstone, has Dawly, in Middlesex, which one reaches through Italian gardens.

"James Cecil, Earl of Salisbury, at seven leagues' distance from London, has Hatfield House, with its four seigniorial pavilions, its belfry in the centre, and its court of honor, flagged in white and black, like that of St. Germain. This palace, which has a frontage of two hundred and seventy-two feet, was built under James I., by the lord high treasurer, who is the great-grandfather of the living earl. There may be seen the bed of a Countess of Salisbury, of inestimable value, entirely made of a Brazilian wood that is a panacea against the bite of serpents, and that is called *milhombres*, which means *a thousand men*. Upon this bed is written, in letters of gold: '*Honi soit qui mal y pense*.'

"Edward Rich, Earl of Warwick and Holland, has Warwick Castle, where they burn whole oak-trees in the fire-places.

"In the parish of Seven Oaks, Charles Sackville, Baron Buckhurst, Viscount Cranfield, Earl of Dorset and Middlesex, has Knowle, which is as large as a town, and which is composed of three parallel palaces, one behind the other, like lines of infantry, with ten spiral gables on the principal façade, and an entrance beneath a donjon-keep with four turrets.

"Thomas Thynne, Viscount Weymouth, Baron Varminster, possesses Long-Leate, which has almost as many chimneys, lanterns, alcoves, pepper-casters, pavilions, and turrets, as Chambord, in France, belonging to the king.

"Henry Howard, Earl of Suffolk, has, at a dozen leagues from London, the palace of Audley-End, in Middlesex, which scarcely yields in vastness and majesty to the Escorial of the King of Spain.

"In Bedfordshire, Wrest-House-and-Park, which is a whole country enclosed within ditches and walls, with woods, rivers, and hills, belongs to Henry, Marquis of Kent.

"Hampton Court, in Herefordshire, with its strongly-battlemented donjon, and its garden barred in by a sheet of water that separates it from the forest, is the property of Thomas, Lord Coningsby.

"Grimsthorp, in Lincolnshire, with its long façade divided by lofty turrets in impalements, its parks, its fish-ponds, its pheasant-tries, its sheepfolds, its bowling-greens, its quincunxes, its malls, its woods of old trees, its pastures bordered, quadrilled, and lozenged with flowers, so as to resemble vast carpets, its race-grounds, and the majesty of the sweep in which carriages turn before entering to the chateau, belongs to Robert, Earl Lindsay, hereditary lord of the forest of Walham.

"Up-Park, in Sussex, a chateau of square form, with two symmetrical belfry-pavilions on the two sides of the court of honor, is owned by the right honorable Ford, Lord Grey, Viscount Glendale, and Earl of Tankerville.

"Newnham-Padox, in Warwickshire, which has two quadrangular fish-ponds, and a gable with glass on four sides, belongs to the Earl of Denbigh, who is also Count of Rheinselden in Germany.

"Wythame, in Berkshire, with its French garden, in which are cut four tunnels, and its grand crenellated tower with lofty battlements, is owned by Lord Montague, Earl of Abingdon, who has also Rycott, of which he is baron, and of which the principal door bears the device, *Virtus ariete fortior*.

"William Cavendish, Duke of Devonshire, has six country-seats, one of which is Chatsworth, an edifice of two stories, in the finest Greek style; his grace has also his mansion in London, where there is a lion that turns his back on the king's palace.

"Viscount Kimalmeaky, who is Earl of Cork in Ireland, owns Burlington House in Piccadilly, with vast gardens that extend to the fields outside of London. He has also Chiswick, where there are nine magnificent main buildings. He has also Londesburgh, which is a new residence, by the side of an old palace.

"The Duke of Beaufort has Chelsea, containing two Gothic châteaux and one Florentine; he has also Badminton in Gloucestershire, which is a residence whence a number of avenues diverge after the manner of a star. The most noble and mighty prince, Henry Duke of Beaufort, is at the same time Marquis and Earl of Worcester, Baron Raglan, Baron Power, and Baron Herbert of Chepstow.

"John Holles, Duke of Newcastle and Marquis of Clare, is owner of Bolsover, of which the square donjon-keep is majestic, besides Haughton in Nottinghamshire, where there is, in the centre of a basin, a circular pyramid in imitation of the Tower of Babel.

"William, Lord Craven, Baron Craven of Hampstead, has a residence in Warwickshire, Comb Abbey, where may be seen the finest jet of water in England; also, in Berkshire, two baronies—Hampstead-Marshall, the façade of which shows five connected Gothic lanterns, and Ashdowne Park, which is a mansion at the point of intersection of several cross-roads in a forest.

"Lord Linnæus Clancharlie, Baron Clancharlie and Hunkerville, Marquis of Corleone in Sicily, derives his peerage from the Castle of Clancharlie, erected in 914, by Edward the Elder, against the Danes; he has also Hunkerville House in

London, which is a palace; also, at Windsor, Corleone Lodge, which is the same thing; also eight dependencies, one at Buxton on the Trent, with tolls upon the alabaster quarries; then Gumdraith, Hombie, Moricambe, Trenwardraith, Hell-Kerters, where there is a marvellous well; Pillinmore and its peat-bogs, Reculver near the ancient town Vagniacæ, Vinecaunton on the mountain Moilembli; also nineteen market-towns and villages with bailiffs, and the whole country of Pens-neth-chase, which together bring in to his lordship a rent of forty thousand pounds sterling.

"The one hundred and seventy-two peers flourishing under James II. possess among them, in lump sum, an annual revenue of twelve hundred and seventy-two thousand pounds sterling, which is the eleventh part of the revenue of England."

On the margin, by this last name, Lord Linneus Clancharlie, might be read this note in the handwriting of Ursus:

*A rebel; in exile; goods, houses, and domains under sequestration. So much the better.*

#### IV.

URSUS admired Homo. We admire that which is akin to us. This is a law.

To be always furious without outburst, this was the internal condition of Ursus; grumbling was his external condition. Ursus was the malcontent of creation. He was, in Nature, the one that gives rise to opposition. He took the universe in bad part. He gave no certificate of well-doing to any person or any thing. Making honey did not absolve the bee from stinging; a full-blown rose did not excuse the sun for the yellow fever and the black vomit. It is probable that within himself Ursus often criticised the Deity. He said: "Evidently, the devil is set on springs, and the mistake of God is in having pulled the trigger." He scarcely approved any one but princes, and he had his own peculiar manner of applauding them. One day, when James II. presented a massive golden lamp to the Virgin of a Catholic chapel in Ireland, Ursus, who was passing by with Homo, more indifferent than he, broke forth into admiration before all the people, and exclaimed: "It is certain that the holy Virgin has much more need of a golden lamp, than these little barefooted children have of shoes."

Such proofs of his devotion, and the evidence of his respect for the established powers, contributed probably not a little to making the magistrates tolerate his vagabond existence and his misalliance with a wolf. Sometimes, in the evening, from a feeling of friendly weakness, he allowed Homo to stretch his limbs a little and wander at liberty around the cart.

The wolf was incapable of an abuse of confidence, and bore himself in society, that is to say among men, with the discretion of a poodle-dog. However, if they had had to do with ill-tempered constables, this might have given rise to inconvenience; therefore Ursus kept, so far as was possible, the honest wolf chained up. In a political point of view, his label about the gold, having become undecipherable and being otherwise scarcely intelligible, was nothing else than a daub upon the façade, and did not denounce him. Even after James II., and under the "respectable" reign of William and Mary, the little county-towns of England could see his cart prowling round about in peace. He travelled, without hinderance, from one end of Great Britain to the other, retailing his philters and his phials, enacting, in partnership with his wolf, his ambulant-doctor mummeries; and he passed with ease through the meshes of the nets spread by the police of that epoch all over England, for picking clean the migratory tribes, and specially for arresting the *Comprachicos* on their way.

And this was just. Ursus was of no tribe. Ursus lived with Ursus; *tête-à-tête* of himself with himself, into which a wolf poked his muzzle. The ambition of Ursus might have been to be a Carib; this unattainable, he was the personification of solitude. The recluse is a modified savage, accepted by civilization. The more one wanders, the more one is alone.

Thence his perpetual shifting from place to place. To remain anywhere seemed to him the being tamed. He passed his life in passing on his way. The sight of towns redoubled in him his preference of brushwood, thickets, thorns, and holes in rocks. His home was the forest. He did not find himself much out of his element amid the hubbub of public places, which sufficiently resembles the murmur of trees. A crowd satisfies to some extent one's craving for the desert. That which worried him in his crib was that it had a door and windows, and looked like a house. He would have attained his ideal, if he could have put a cavern on four wheels, and travelled about in a cave.

He did not smile, as we have said; but he laughed sometimes; frequently even. It was a bitter laugh. There is something of content in the smile, whilst the laugh is often a refusal.

His grand business was to hate the human race. He was implacable in this hate. Having come to a definite conclusion that human life is a hideous affair, having remarked the superimposition of plagues—kings upon peoples, war upon kings, pestilence upon war, famine upon pestilence, stupidity upon every thing—having recognized a certain amount of chastisement in the mere fact of existence, having established that death is a deliverance, when they brought to him a sick man, he cured him. He had cordials and beverages for prolonging the life of old persons. He set up on their feet cripples squatting in a wooden bowl, and threw at them this sarcasm: "There you are, upon your pins; may you walk for many a day, through the valley of tears!" When he saw a poor fellow dying of hunger, he gave him all the farthings he had about him, while growling out: "Live, miserable wretch! eat! last a long time yet! I am not the man to abridge your term in the convict prison!" After this, he rubbed his hands, and said: "I do men all the harm I can."

Passers-by, looking through the hole in the back window, could read on the roof of the crib this sign, written inside, but visible from without, and charcoaled in large letters: "URSUS, PHILOSOPHER."

## II.—THE COMPRACHICOS.

### I.

Who is acquainted at this day with the word *Comprachicos*, and who knows what it means?

The *Comprachicos*, or *Comprapequeños*, were a hideous and strange nomadic affiliation, famous in the seventeenth century, forgotten in the eighteenth, unknown in our time. The *Comprachicos* are, like the "succession powder," an ancient and characteristic social mark. They form a part of the old human squalor. For the sweeping glance of history, which brings all into one view, the *Comprachicos* belong to the immense fact, slavery. Joseph, sold by his brethren, is a chapter of their story. The *Comprachicos* have left a trace in the penal legislations of Spain and of England. You find here and there, in the dark confusion of English laws, the pressure of this monstrous reality, as you find the footprint of the savage in a forest.

*Comprachicos*, as also *Comprapequeños*, is a compound Spanish word, which means the buyers of little ones.

The *Comprachicos* drove a traffic in children.

They bought them, and they sold them.

They did not steal them. Stealing children is another trade.

And what did they make of these children?

Monsters.

Why monsters?

For laughter's sake.

The people are bound to laugh; the rocks also. There must be the merry-andrew for the public cross-ways; there must be the buffoon for Louvres. The one is called Turlupin, the other Triboulet.

The efforts of man to procure himself distraction are sometimes worthy of the philosopher's attention.

What are we sketching in these few preliminary pages?—a chapter of the most terrible of books, of the book that might be entitled, *The Utilization of the Unfortunate by the Fortunate*.

## II.

A CHILD destined to be a plaything for men—that has existed. (It exists still in this day.) At epochs artless and ferocious, this constitutes a special pursuit. The seventeenth century, called the great century, was one of these epochs. It was an age decidedly Byzantine; it was marked by a corrupted ingenuousness and a delicate ferocity, a curious variety of civilization. A tiger making pretty faces. Madame de Sévigné mincing, à propos of the stake and the wheel. This century did much in working-up children. Historians, flatterers of the period, have hidden the sore; but they have let us see the remedy—Vincent de Paul.

That the human rattle may succeed, it must be taken early in hand. The dwarf ought to be little when he begins. They played on infancy. But a well-made infant is not very amusing. A hunchback is more gay.

Thence an art. There were bringers-up. They took a man, and they made an abortion; they took a face, and they made a snout. They bent down growth; they kneaded physiognomy. This artificial production of monstrosities had its rules. It was altogether a science. Let an orthopedist be imagined in the inverse sense. There, where God had placed vision, this art placed strabismus. There, where God has put harmony, they put deformity. There, where God has put perfection, they reestablished the rough draft. And, in the eyes of connoisseurs, it was the rough draft that was perfect. There were equally tamperings with his work for animals. Piebald horses were invented. Turenne rode a piebald. Do we not, in our day, paint dogs in blue and in green? Nature is our canvas. Man has always desired to add something to God. Man retouches the creation, sometimes for good, sometimes for evil. The court buffoon was nothing else than an attempt to bring back man to the ape. Progress to the rear. Masterpieces going backward. At the same time, they tried to make the ape man. Barbe, Duchess of Cleveland and Countess of Southampton, had a monkey for her page. In the household of Frances Sutton, Baroness Dudley, eighth peeress on the barons' bench, tea was handed by a baboon dressed in gold brocade, that Lady Dudley called her negro. Catherine Sidley, Countess of Dorchester, went to a sitting of Parliament in a carriage bearing her coat-of-arms, behind which stood up, their muzzles in the air, three monkeys, in full livery. A Duchess of Medina-Cœli, whose levee was attended by a Cardinal, had her stockings put on by an orang-outang. These baboons, thus promoted, were a counterweight against brutalized and bestialized men. This promiscuousness between man and beast, willed by the great, was especially called into action through the dwarf and the dog. The dwarf never quitted the dog, that was always bigger than himself. The dog was the dwarf's pet. They were like two coupled links in a necklace. This juxtaposition is proved by a host of domestic monuments, notably by the portrait of Jeffroy Hudson, dwarf of Henriette of France, the daughter of Henry IV., the wife of Charles I.

To degrade man is equally to deform him. The suppression of his natural state was completed by disfiguring him. Certain vivisectioners of those times had great success in effacing the divine stamp from the human countenance. Doctor Conquest, a member of the College in Amen Street, and a sworn inspector of the chemists' shops in London, has written a book in Latin on this perverted surgery, of which he gives the proceedings. If we may believe Jusens Carrick-Fergus, the inventor of this surgery was a monk named Aven-more, an Irish word that signifies great river.

The dwarf of the Elector Palatine, Perke, whose doll—or

the ghost of it—jumps out of a box in the cavern of Heidelberg, was a remarkable illustration of this science, so varied in its applications.

Thus were beings made, whose law of existence was monstrously simple: permission to suffer, order to be amusing.

## III.

This fabrication of monsters was practised on a large scale, and comprised divers sorts.

There must be some for the Sultan; there must be some for the Pope. For the one, to help him guard his wives; for the other, to make his prayers. It was a style apart, unable to reproduce itself. These approaches to humanity were useful to voluptuousness and to religion. The seraglio and the Sistine Chapel put into requisition the same kind of monsters, here ferocious, there gentle.

They knew how, in those times, to produce things that are no more produced now; they had talents that we lack, and it is not without cause that smart fellows complain of our falling-off. Sculpture no longer knows how to work upon plain human flesh. This is because the art of corporal punishment is being lost. There were virtuosi in this branch; there are none now. The art has been simplified to such a point, that it will, perhaps, soon disappear entirely. In cutting off the limbs of living men, in opening their bellies, in taking out their bowels, one lighted on phenomena, one had his godsend; we must give that up, and we are deprived of the progress that the executioner was making in surgery.

This vivisection of other days was not limited to perfecting phenomena for the public resort, buffoons for the palace—a species of improvement upon the courtier—and eunuchs for sultans and popes. It abounded in variations. One of its triumphs was the making a cock for the King of England.

It was the custom, in the English king's palace, that there should be a sort of nocturnal man, who could crow like a cock. This watcher, up while others slept, prowled round the palace, and uttered, from hour to hour, this cry of the poultry-yard, repeated as often as was needed for supplying the place of a clock. This man, promoted to be a cock, had for this purpose undergone, in childhood, an operation on the pharynx, which was a portion of the art described by Dr. Conquest. Under Charles II., the salivation resulting from the operation having disgusted the Duchess of Portsmouth, the office was kept up, so as not to diminish the lustre of the crown, but a man not mutilated was made to do the crowing. For this employment a veteran officer was usually selected. Under James II., this functionary called himself William Sampson Cock, and received annually, for his crowing, nine pounds two shillings and sixpence.\*

Scarcely a hundred years ago, as the memoirs of Catherine II. tell us, when the Czar or Czarina was displeased with any Russian prince, the prince was made to cower down in the grand antechamber of the palace, and remained in this posture an appointed number of days, mewing, by order, like a cat, or clucking like a hen that is sitting, and pecking at his food on the floor.

These modes are out of fashion—less, however, than one supposes. To-day, the courtiers, who cluck to please, modify a little their intonation. More than one picks up from the ground—we do not say from the mud—what he eats.

It is very fortunate that kings cannot deceive themselves. In this way their contradictions never embarrass them. Approving unceasingly, one is sure to be always right—which is pleasant. Louis XIV. would not have liked to see at Versailles either an officer playing the cock, or a prince playing the turkey. What enhanced the royal and imperial dignity in England and in Russia would have seemed to Louis the Great incompatible with the crown of St. Louis. His annoyance is well known

\* See Dr. Chamberlayne's "Present Condition of England," 1688, 1st part, chap. xlii., p. 179.

when Madame Henriette, one night, so far forgot herself as to see a hen in a dream, in fact a grave breach of etiquette for a person of the court. When one belongs to the lofty, one ought not to dream of the lowly. Bossuet, it will be remembered, like Louis XIV., thought it scandalous.

## IV.

THE trade in children, during the seventeenth century, was made complete, as we have just explained, by a craft. The Comprachicos followed this trade and practised this craft. They bought children, worked up a little this first material, and presently sold it again.

The sellers were of every kind, from the miserable father getting rid of his family, to the master utilizing his stud of slaves. Selling men was a very simple affair. In our day, one is punished for maintaining this right. It may be remembered that, less than a century ago, the Elector of Hesse sold his subjects to the King of England, who wanted men for killing in America. They went to the Elector of Hesse as to a butcher to buy meat. The Elector of Hesse kept gun-flesh. This prince hung up his subjects on nails in his shop. Bargain! they are for sale. In England, under Jeffreys, after the tragical adventure of Monmouth, many a lord and gentleman was decapitated and quartered. These victims left wives and daughters—widows and orphans, whom James II. presented to the queen his wife. The queen sold these ladies to William Penn. It is probable that this king had discount allowed him, and so much per cent. What is surprising is, not that James II. should have sold these women, but that William Penn should have bought them.

The bargain by Penn is excused or explained herein, that Penn, having a desert to sow with men, had need of women. The women were a part of his implements.

These ladies were a good thing for her gracious majesty the queen. The young ones brought a high price. One has the uncomfortable sense of a complicated scandal, in reflecting that Penn probably got the old duchesses very cheap.

The Comprachicos were called also the *Cheyilas*, a Hindoo word that signifies the spoilers of child-nests.

For a long period, the Comprachicos only half hid themselves. There is, sometimes, in the social arrangement, a penumbra, not unfavorable to nefarious crafts; they keep themselves alive therein. We have witnessed in our day, in Spain, an affiliation of this sort, directed by the bandit Ramon Selles, last from 1834 to 1866, and keep for thirty years three provinces in a state of alarm, Valencia, Alicante, and Murcia.

Under the Stuarts, the Comprachicos were not in bad odor at court. At need, state-craft made use of them. They were, for James II., almost an *instrumentum regni*. It was the epoch when cumbersome and refractory families were thinned off, when dependants were cut short, when heirs were abruptly suppressed. Sometimes one branch was defrauded for the benefit of another. The Comprachicos had one talent—that for disfiguring—which recommended them politically. To disfigure is more advantageous than to kill. There was, in truth, the iron mask, but that was an awkward weapon. One can't people Europe with iron masks, whilst deformed mountebanks haunt the streets quite naturally. Besides, the mask of iron can be snatched off, and the masks of flesh cannot. Masking you forever with your own countenance—nothing is more ingenious. The Comprachicos worked up man as the Chinese work up a tree. They had secrets, as we have said; they had special dodges. This is a lost art. A certain fantastic stunting came from their hands. It was preposterous, but deep-set. They touched up a little being with so much tact that its father would not recognize it. Et que méconnaît l'œil même de son père, says Racine, with an error in his French. Sometimes they left the dorsal column straight, but they remade the face. They took the mark out of a child as one takes the mark out

of a handkerchief. The progeny intended for jugglers had their joints dislocated in a scientific way. They might be said to be boned. This made gymnasts.

Not only did they take away from the child his countenance; they also deprived him of his memory. At least they took away all they could. The child was unconscious of the mutilation that he had undergone. This fearful surgery left a trace upon his face, not in his mind. At the best he could but remember that, one day, he had been seized by certain men, that he had gone to sleep, and that then he had been cured. Cured of what?—he did not know. Burnings with sulphur and incisions by steel—he could recall nothing. The Comprachicos, during the operation, deadened the little patient by means of a stupefying powder that passed for magical, and that suppressed pain. This powder has been always known in China, and is used there to this day. China has had, before us, all our inventions—printing, artillery, aërostation, chloroform. Only, the discovery, that in Europe springs at once into life and growth, remains in embryo in China, and though preserved is dead. China is a glass bottle for a fœtus.

As we are in China, let us stay there a moment, for certain details. In China, from time immemorial, ingenuity and handicraft have been applied to this matter: namely, the moulding of the living man. They take a child of two or three years old, and put it into a porcelain vase, more or less quaint, but without lid or bottom, so that the head and the feet are exposed. In the day-time the vase is kept upright; at night it is lain on its side, so that the child may sleep. Thus the child grows bigger without growing taller, filling up the embossments of the vase with its compressed flesh and twisted bones. This growth in the bottle lasts for several years. At a given period it is without remedy. When it is decided that the mould has taken, and that the monster is made, they break the vase, the child comes out from it, and they have a man with the form of a pot.

It is convenient; one can order one's dwarf beforehand, of any desired shape.

## V.

JAMES II. tolerated the Comprachicos; and for good reason—he made use of them. At least this happened to him more than once. One does not always disdain what one despises. Such lower calling, excellent expedient sometimes for the higher calling that is termed politics, was voluntarily left miserable, but was not persecuted. No superintendence, but a certain attention. It might be useful. The law shut one eye; the king opened another.

Sometimes the king went so far as to avow his complicity. Such is the effrontery of monarchical terrorism. The disfigured object was *fleur-de-lysé*; the mark of God was removed, and the mark of the king put on. Jacob Astley, knight and baronet, lord of the manor of Melton, constable of the county of Norfolk, had in his family a child that had been sold, on whose forehead the vendue-master had imprinted, with a hot iron, a *fleur-de-lys*. In certain cases, if it were desirable from any cause to establish the royal origin of the child's newly-made condition, this method was employed. England has always done us the honor to utilize, for personal objects, the *fleur-de-lys*.

The Comprachicos—with the distinction that separates a calling from fanaticism—were analogous to the Thugs of India; they lived apart by themselves, in bands, with a dash of the mountebank, but for pretext. Moving about was thus easier for them. They camped here and there, but grave, religious, and—differing herein from all other nomads—in capable of theft. People have for a long time erroneously confounded them with the morris-dancers of Spain and the morris-dancers of China. The Spanish morris-dancers were coiners of false money; the Chinese morris-dancers were sharpers. Nothing of this sort with the Comprachicos. They were honest folk. One may think what one pleases of them, they were sometimes sincerely scrupulous. They pushed open a door, went in, bar-

gained for a child, paid, and carried it off. This was done with all preciseness.

They were of all countries. Under this name, Comprachicos, Englishmen, Frenchmen, Castilians, Germans, and Italians, fraternized. One same thought, one same superstition, the following out the same trade in common, bring about these fusions. In this fraternity of vagabonds, Levantines represented the East, and seamen of the western coast of France represented the West. Many a Basque therein held dialogue with many an Irishman. The Basques and the Irish understand each other; they speak the same Punic jargon. Add to this the intimate relations of Catholic Ireland with Catholic Spain. Such relations ended in the hanging at London of a quasi-king of Ireland, the Welsh lord of Brany, which brought about the earldom of Leitrim.

The Comprachicos were rather an association than a tribe, rather a residue than an association. It was all the beggardom of the universe, having a crime for a calling. It was a sort of harlequin people, made up of all manner of rags. To take a man into it was to patch up a tatter.

To wander was the law of the Comprachicos' existence. To appear; then to disappear. He who is only tolerated takes no root. Even in kingdoms where their craft was a court purveyor, and, at need, an auxiliary of the royal power, they were at times and all at once treated harshly. Kings made use of their art, and sent the artists to the galleys. These inconsistencies are in the come-and-go of royal caprice. Such is our good pleasure.

Rolling stone and wandering industry gather no moss. The Comprachicos were poor. They might have said what the lean and tattered sorceress said, when she saw the torch lighted at the stake, "The game is not worth the candle." Possibly, probably even, their chiefs, remaining in the background; the wholesale adventurers in the trade in children, were rich. This point, after two centuries, it would be difficult to clear up.

It was, we have said, an affiliation. It had its laws, its oath, its formulas. It had almost its cabal. Whoever desires to learn much to-day concerning the Comprachicos, has only to go into Biscay and into Galicia. As there were many Basques among them, it is in these mountains that their legends remain. They still talk of the Comprachicos at this very hour at Oyazun, at Urbistondo, at Leso, at Astigarraga. *Aguárdate, niño, que voy á llamar al comprachicos!*\* is still in that district the intimidating cry of mothers to their children.

The Comprachicos, like the Tchiganes and the gypsies, appointed meetings among themselves; from time to time their chiefs exchanged colloquies. There were, in the seventeenth century, four principal points of gathering. One was in Spain, the defile of Pancorbo; one in Germany, the glade called the Bad Woman, near Dickirsch, where there are two enigmatical bas-reliefs, representing a woman who has a head, and a man who has none; one in France, the hillock whereon was the colossal statue *Massue-la-Promesse*, in the ancient sacred wood Borvo Tomona, near Bourbonne-les-Bains; one in England, behind the garden-wall of William Chaloner, Esquire, of Gisborough, at Cleveland, in Yorkshire, between the square tower and the main gable, pierced with an ogive door.

The laws against vagrants have always been very rigorous in England. England, in her Gothic legislation, seemed to inspire herself with this principle: *Homo errans ferè errante peior*. One of her special statutes describes the man without a home as "more dangerous than the asp, the dragon, the lynx, and the basilisk" (*atrociór aspide, dracone, lynce, et basilico*). England had for a long time the same solicitude about gypsies, of whom she desired to be rid, as about wolves, which she had swept away.

The English law, nevertheless, in the same way as it tolerated, as we have seen, the tamed and domesticated wolf, be-

come in some sort a dog, tolerated the vagabond by profession, become a subject. They did not trouble the mountebank, nor the travelling barber, nor the physician, nor the pedlar, nor the out-of-doors man of science, seeing that these had a trade for their livelihood. Beyond this, and with very few exceptions, the sort of free man that there is in the wandering man gave disquietude to the law. A passer-by was a possible public enemy. That modern invention, sauntering, was unknown; all that was known was the old action, prowling round. The "bad look," that indescribable something that all the world comprehends and that nobody can define, sufficed for society's taking a man by the collar. "Where do you live?" "What do you do?" And, if he could not answer, rude penalties awaited him. Steel and fire were in the code. The law practised the cauterization of vagabondism.

Thence, throughout the English territory, a true "law for suspected persons," applied to trampers—willingly evil-doers, let us say—and especially to gypsies, whose expulsion has been erroneously compared to the expulsion of the Jews and the Moors from Spain, and of the Protestants from France. As for us, we do not confound a battue with a persecution.

The Comprachicos, let us insist upon it, had nothing in common with the gypsies. The gypsies were a nation; the Comprachicos were a compound of all nations; a residue, we have said; a horrible wash-hand basin of impure waters. The Comprachicos had not, like the gypsies, an idiom of their own; their jargon was a jumble of idioms; all languages intermingled made up their language; they spoke a gibberish. They had finished by being, as well as the gypsies, a people winding its way among peoples; but their common bond was affiliation, not race. At all the epochs of history, one can distinguish, in this vast liquid mass, that which is humanity, from the sluices of venomous men flowing apart, with something of poison all about them. The gypsies were a family; the Comprachicos were a freemasonry—a masonry having not a noble aim, but a hideous pursuit. Last point of difference, religion. The gypsies were pagans; the Comprachicos were Christians—and even good Christians, as becomes an association which, albeit compounded of all peoples, had taken its rise in Spain, a devout locality.

They were more than Christians, they were Catholics; they were more than Catholics, they were Romans; and so distrustful in their faith and so pure, that they refused to unite with the Hungarian nomads of the comitat of Pesth, commanded and conducted by an old man who had for his sceptre a staff with a silver top, surmounted by the double-headed eagle of Austria. It is true that these Hungarians were schismatics to such a degree as to celebrate the Assumption on the 27th of August, which is an abomination.

In England, so long as the Stuarts reigned, the association of the Comprachicos was—we have let the motive be understood—almost patronized. James II., a devout man, who persecuted the Jews, and hunted down the gypsies, was a good prince for the Comprachicos. You have seen wherefore. The Comprachicos were buyers of the human commodity, in which the king was a dealer. The good of the state demanded an occasional disappearance. A troublesome heir, at an early age, whom they took and manipulated, lost his form. This made confiscations easy; the transfer of lordships to favorites was facilitated thereby. The Comprachicos were extremely discreet and very taciturn; they pledged themselves to silence, and kept their word, which is essential in state affairs. There was scarcely an instance of their having betrayed the king's secrets. This, it is true, was their own interest. And, if the king had lost confidence in them, they would have been greatly in danger. They were, therefore, a resource, in the political point of view. Besides, these artists supplied the Holy Father with singers. The Comprachicos were useful for Allegri's *Miserere*. They were particular devotees to Mary. All this was acceptable to the papism of the Stuarts. James II. could not be hostile

\* "Take care, child, I am going to call the Comprachico!"

to religious men, who pushed their devotion to the Virgin so far as to manufacture eunuchs. In 1688, there was a change of dynasty in England. Orange supplanted Stuart.

James II. went to die in exile, where miracles were wrought over his tomb, and where his relics cured the Bishop of Autun of a fistula—worthy recompense of this prince's Christian virtues.

William, not having the same views or the same practices as James, was severe with the Comprachicos. He set about crushing out these vermin with hearty good-will.

A statute of the early period of William and Mary hit hard this association of child-buyers. It was a terrible blow for the Comprachicos, henceforth ground to powder. By the terms of this statute, the men of this association, taken and duly convicted, were to be branded upon the shoulder with a hot iron imprinting an R, which stands for rogue, that is to say, beggar; upon the left hand a T, standing for thief, that is to say, robber; and upon the right hand an M, signifying man-slayer, that is to say, murderer. The chiefs, "presumed to be rich, though of beggarly aspect," were to be punished by the *collistrigium*, which is the pillory, and marked on the forehead with a P, besides having their possessions confiscated, and the trees of their woods rooted up. Those who failed to denounce the Comprachicos were to be punished by confiscation and perpetual imprisonment, as for the crime of misprision. As for the women found among these men, they were to undergo the "cucking-stool," which is a trap, the name of which, composed of the French word *coquine* and the German word *stuhl*, has an indecent signification. English law being gifted with a strange longevity, this punishment still stands on record for "quarrelsome women." The cucking-stool is suspended over a river or pond; the culprit is seated thereon, and is then allowed to tumble into the water; then she is drawn out; and this ducking of the woman is recommenced three times, "to refresh her anger," says the commentator Chamberlayne.

### I.

#### BROWN STUDIES.

I AM a lover of the Brown Study, in which, as in a mantle, I often wrap myself, and ruminate sweetly and strangely. There is no passionate reaction, no painful awakening from the visions engendered by this harmless day-dreaming, as with those which are stimulated by hashish or lotus-eating. The Brown Study deadens pain, gilds labor, sweetens care, removes anxiety, and fills all the soul with a soft rapture from which the awakening is pleasant and wholesome. There are elements of indulgence and relaxation in it, it is true, but in this harsh world it is strange if we cannot permit ourselves at least a few idle dreams of happiness, the only form in which to many of us it can ever come. The Brown Study may be indulged in by an open window, by a slow and slumberous fire, "under green leaves," by brook or lake-side, by the solemn surge of the sea, and even amidst the stir and bustle of busy highways. Its subjects are as various as life, and its requirements are simply a surrender of the whole domain of the mind to its wayward and capricious courses.

All devotees of the Brown Study are prone to come into large fortunes; to fall rapturously in love with tender-hearted women; to achieve great successes in art, literature, or commerce; to scatter with princely munificence exhaustless wealth; to create rare Utopias; and to turn labor, skill, genius, application, love, and all human sentiments, into triumphant engines of earthly bliss. Nature bursts into beauty, and art into production; the heavens smile and the winds are tempered; all that the fancy covets, the senses love, or the heart yearns for, spring into form and life at the command of this mystic talisman. It is one of the fine qualities of the Brown Study, that its students are en-

dowed with charity and good-will. The munificence of their gifts, the breadth and comprehensiveness of their largess, are noble. One of the keenest pleasures experienced under the influence of this study, is the ability which it dreamingly affords of scattering happiness around, whether the reveries be of wealth, or love, or friendship, or success. This alone ought to redeem the habit from the charge of idle dreaming. A bliss that multiplies itself by wide bestowing, a happiness that discovers a most exquisite delight in its power to bless, must leave a sweetness in the heart worth all the indulgence and relaxation by which it is created.

But the ruminations of the devotee are not always idyls. He is often polemical and disputatious; he has enemies to conquer, black flags to attack, faiths to propagate in true militant spirit. Often he finds a singular charm in the devices by which he seeks to escape pursuit, or elude search. In these, the narrow escapes, the skilful disguises, the doublings, the bold incidents, the final triumph, are masterly. Collins has written no tale of ingenious complexity, Poe illustrated no piece of detective skill, that outdoes the Brown Study in subtlety or invention. But these studies are almost too intellectual to be legitimate—Aladdin and not Fouquet is the master-spirit of the art.

One is puzzled to discover why this species of dreaming should have received the dull and sombre name of Brown. Is it because it is so often evoked by the brown cigar, or the smoke-colored pipe? Is there something in the rapt, lost, far-away look of the dreamer that is dun and dim, as if the soul had faded away out of the features, and left them blank and empty? Or is it because these dreams are more potent in the autumn of life, when all things are sere and sombre? Possibly it is because brown is soft and mellow, and has rich warm depth of character and expression—and yet brown is of the earth, and these dreams are tinted with the hues of heaven. Brown, indeed, the outward aspect may be, but a delicious dreaming that lights up the soul with splendid colors, that fills the imagination with pomp and splendor, that converts all things into beauty, promise, and delight, must always, to my imagination, be a Golden Study.

#### BORROWING.

After all, there is no better occupation, and no greater excellence, than borrowing. I am entirely honest in what I say. I mean borrowing, moreover, that takes little heed of how repayment shall be made, and never dreams of making returns in kind. Possibly borrowing is too mild a word to describe the species of appropriation to which I refer, but I can scarcely call it stealing, inasmuch as none find themselves losers, no matter how liberally the function may be exercised. How, indeed, can the mind become stored with facts or fancies, unless it filches ideas boldly, whether from life and observation, or from those open reservoirs of stolen learning called books? Is he not ripest and richest whose powers of appropriation are the most active, whose disposition to borrow is the keenest? There are those, indeed, who pass through the world gathering nothing, whose observation of the busy panorama of life unrolling before them is too sluggish to purchase experience, or appropriate any teaching. Facts rebound from them, and ideas float by, giving neither shadow nor color. Others borrow readily, but are too eager to surrender their spoils; like sponges, they absorb readily, and as readily disgorge, having no power of retention. Then there are the true borrowers, intellectual highwaymen, we may call them, waylaying ideas everywhere, plundering every circumstance or experience of its significant teaching, robbing stones of their sermons, and running brooks of their learned babblings. Nothing passes before them that is not required to surrender its meaning; and the world, yielding its significant facts to their impatient demands, is as proud to lend as they are eager to be enriched.

#### IDOLATRY.

I have sometimes been inclined to question the truth of idolatry. Of course, this is to impeach the historians, the theolo-

gians, and the travellers; but, in the depths of my consciousness, as the Germans would say, I realize the probable truth that, in all cases, behind the image worshipped exists an *idea*. In all religions we discover a tendency to exalt symbols, and even in branches of the Christian church we find the agent or physical representation of an idea becoming so far identified with the thought it is designed to symbolize as to be apparently almost substituted for it. The savage while adoring his idol possibly conceives, it may be only in a faint, vague way, that the image he is prostrate before includes something, symbolizes something, represents something, not visible nor made. But, being incapable of refined distinctions, with no skill or experience in analyzing his own emotions, he can only feebly realize this fact to himself, and has no means of explaining it to others. See how among cultivated people, in things that are apart from religion and having less vital hold on the imagination, symbols are exalted and almost deified. Look at the popular devotion to the national symbol, the flag. One ignorant of the nature of this feeling might well misconceive it—for do we not uncover before our flag, bow to it, kneel before it, become passionately enthusiastic in its defence? Have not travellers told us of the sensations experienced when first beholding its inspiring stars and stripes after a long absence? Do we not unconsciously, and consciously too, transfer to the painted cloth almost all that veneration and love that we feel for all those sentiments which it embodies, personifies, and glowingly expresses? We, indeed, claim to know the difference between the idea and the representative, but I am not quite sure that this is so entirely. We may endeavor to resolve this affection back to the sources where it justly belongs, and yet a residuum, as it were, an undefined remainder, will still cling to the symbol. This being true in any degree with us, it opens a door to an explanation of all forms of idolatry—a worship which, without some solution of the kind, remains inconceivable.

#### STATESMANSHIP.

A great statesman is only a great negation. His duty is mainly to stand sentinel over the interests of society, in order to protect them from the presumptuous intermeddling of fools. Natural laws, he has learned, will regulate the affairs of men better than Presidents or Parliaments can, and his great duty is to see that these laws have undisturbed operation. If ever a knowledge of the proper limits of the duties and powers of government should become widely extended, great statesmen will cease to be necessary, because in that case statesmanship will be the diffused and ordinary acquirement of the popular mind. There is no problem so simple as that of government, and yet none that perplexes so universally. Its legitimate function being merely to secure to each citizen every liberty not inconsistent with everybody else's liberty—this is Herbert Spencer's masterly definition—it is obvious that a general acceptance of this idea will render statesmanship a lost occupation, inasmuch as it will deprive government of almost all its powers of mischief, and limit its obligations to the preservation of order and the protection of life and property. "The uses of government," says a modern writer, "are in inverse ratio to the development of society," which is well said. By and by, when we have learned the lesson well, we will convert government into what it properly should be, a *police*—and nothing more; depriving it of all control of our trade, our commerce, our beliefs, our habits, or our occupations, leaving all things as free as air. We hear of Paternal Governments! It has always been a paternity that has made havoc with the interests of men; that has imposed obnoxious faiths; that has taxed, and drained, and sucked dry the thrift of its subjects; that has been a burden, strangling enterprises and extinguishing spirit; that has made wars and discords, keeping mankind fierce, turbulent, and mutually destructive; and only those peoples, who have in a degree escaped this paternity, have secured for themselves prosperity and happiness.

#### THE PLAYERS.

I am fond of new plays and like the players. It is an article of faith with me that neither the one nor the other are so excellent as they were in the "palmy days" (I believe that is the phrase) of the drama, and, if I have an occasional suspicion that the actors and dramas of the old time were not in truth so brilliant and halcyon as they appeared to me and others in our "salad days," I do not intend to make the confession. If we old files are to be believed, the art of acting is dying out, and the very traditions of the stage disappearing. Possibly we are right, and perhaps, moreover, it is a blessed thing if we are. Something in that case, no doubt, would be lost, but not a little gained. Very likely the spirit, which in painting we call pre-Raphaelitism, is obtaining its influence on the stage, and that some of the actors are turning out of doors the traditions and formal mannerisms of the schools, and going back to nature and truth for their inspiration. I cannot say, however, that I have been generally pleased with the success of those who have enlisted under the new banners. There were very artificial methods, no doubt, among the old actors, but there was also a very consummate knowledge of the art, a great deal of breadth, force, and skill, and a finished training, which the new schools do not exhibit. In aiming to be natural, some of our actors seem to have concluded that their profession is not an art. They grow heedless in the delivery of language, weakening or obscuring its meaning, and missing its significance; and in some way lose that rich and mellow coloring that characterized the by-gone performers. So marked is this, that some of the old dramatic characters are abandoned altogether, because in the hands of the Realists they fade away into ineffective and colorless forms. The Sir Peter Teazles and Sir Anthony Absolutes of the old comedy require indispensably the resources of the old art, and no thin, water-gruel realism, so called, can personate them. In avoiding the declamatory Kembletonianism of the old school, our actors are right enough; but they cannot safely disregard the skill which sharpens and chisels as it were the sentences; nor forego the care, study, precision, and stern adherence to rules of art, that marked the old stage.

#### VICTOR HUGO.

VICTOR HUGO, poet, romancer, dramatist, and thinker, enthusiastically admired by the ardent minds of Young France, is listened to by every civilized people. *Literal-minded* lovers of liberty—who are numerous only in England and America—and unscrupulous partisans of power have sneered at the frequent expression of his personal sympathies for revolution in Europe; they have mocked the uncalculating exile, while they have been compelled to acknowledge his genius. Our journalists have not sufficiently appreciated how effective are his personal appeals and encouragements to intensify and aggrandize the sentiment of liberty and of humanity on the Continent; matter-of-fact students of contemporary events have failed to understand the stimulative power of the political letters of the exile of Guernsey; but, however flatly these letters may fall upon the Anglo-Saxon, they touch the soul and awaken anew the aspirations of the more mobile Southern races who live so much more by the imagination and heart.

No English writer's name is so universally associated with the cause of humanity, no writer outside of France has been so intense and comprehensive in his sympathies, as Victor Hugo. At the beginning of his career he was a royalist, and received signal marks of favor from three Kings of France. He was pensioned by Louis XVIII., and honored by Charles X.; he was censured by the Academy, and his drama of *Marion Delorme* was interdicted by an order from the minister of state; in 1845 he was named peer of France by Louis Philippe. After the Revolution of February, he was elected member of the Constitu-

tional Assembly by the city of Paris, and took part in the debates with Proudhon, Louis Napoleon, and Pierre Leroux; re-elected to the *Assemblée Legislative*, he committed himself wholly to the social and democratic party under the influence of Emile de Girardin. He provoked animosity by his passionate language in debate; advocated the abolition of capital punishment; and opposed himself to Napoleon, the new President of the republic, whose prestige he labored to weaken. After the *coup d'état* of the 2d of December of '52, he was exiled by Napoleon III. He retired to the Island of Jersey, but was compelled to leave his asylum and seek another in the Island of Guernsey, which is his home at present. He then wrote "*Napoléon le Petit*" and "*Les Châtiments*," two volumes of satirizing verse. In the retirement and quiet of his English home, free from the immediate influence of the local disorders of France, given wholly to social and literary subjects and the general cause of human progress, he wrote two volumes of personal and passionate poetry, called "*Contemplations*," and his grand social romance, "*Les Misérables*."

Between 1826 and 1831 he wrote his now celebrated dramas which made a literary revolution in French letters, and won him such adherents as St. Beuve, Gautier, and Dumas. In 1841 he was admitted to the French Academy. His career has been uncommon in all its aspects. Born the 26th of February, 1802, at Besançon, of a family ennobled in 1531, his father was governor-general of the most important provinces in Spain. A great part of his childhood was spent in the military campaigns of his father, whom he accompanied with the imperial armies to Elba, Corsica, Geneva, and over the provinces of Italy. After having seen Rome, Florence, and Naples, he returned to Paris; for ten years "he had a sweet and fecund existence in the old convent of the Feuillantines," where he commenced his serious studies under the direction of Lahorie, a proscribed general. Subject at the same time to the influence of his mother, he became imbued with the fervid sentiment of royalty which inspired his first verses. Called to Spain by his father, he studied in the seminary of the nobles, and "found an aliment for his poetic instincts in the spectacle of a new country in the light of a dazzling sun and under a new sky." Alternately subjected to the personal influence of his father and of his mother, who were animated by antagonistic political and religious ideas, he was not permitted to become a dreamer. The incessant change of his life forced him to think, and to think incessantly. Perhaps to his experience during his first years of boyhood we must attribute the dominance of energized thought which characterizes his literary style. No writer and certainly no poet thinks more

incessantly than Victor Hugo. All the passionate questioning of the human intellect, urged by strong sensations and a profound and varied experience, is to be found in his stormy, incisive, and sometimes grand phrases. We have but to glance at his portrait to see the visible type of an aggressive and direct thinker. His square, compact head, his small, penetrating black eyes, fix the attention upon an inflexible face; a face expressive of tenacity; a face positive and bold, and indicating courage of intellect.

No one can deny that Victor Hugo's is the most intensely individualized character among all Continental writers; that his greatness forbids us to classify him with any modern genius. He has taken hold of France, of Europe even, by his vehement intellectual sympathy with the people; the energy and incessant activity of his phantasmagoric mind have always been irresistible to Young France; while his exquisite sensibility to love and the delicate and tremulous life of Nature has made his work the delight of tender hearts that shrink from his horrible and tormented images of human nature.

Victor Hugo's is the antithesis of the modern mind, which is literal and prosaic. He is figurative and imaginative to the utmost license of language. Something enormous and something exquisite provoke the flux and reflux of his restless intellect. His works represent a vast range of experience, and unrestrained and passionate sympathies. He has made the Orient, Spain, France, Italy, and England, the background of his dramatic creations; but it is in France of the middle ages that he has made his finest studies,

and exhibited a just historical genius and an unrivalled sense of the picturesque and romantic aspects of mediæval life.

Victor Hugo, the poet, is vague and vast in his conceptions; he is arbitrary and grand in his imagination—Victor Hugo, the dramatist and romancer, is definite, graphic, bold, direct, vivid. The power, the struggle, the sublime, and the colossal, that we contemplate in Michael Angelo and the grotesque sculptures of the middle ages, we contemplate in Victor Hugo's works. As Michael Angelo is alone among sculptors, Victor Hugo, by many of the same traits, is alone among writers. The grand, the bold, the complex elements of life and nature are in his writings; every thing but the fused and fluent harmonies of thought and emotion which charm us in the expression of Lamartine, of De Musset, of George Sand.

Victor Hugo's literary talent is analogous to the sculptor's. He may be said to chisel his ideas; he carves his figures; he enchases his fantasies. Whether he places before us a colossal figure, in bold, large lines, or delicate *intaglio*, deeply,

Hauteville House, Home of Victor Hugo.

VICTOR HUGO.

sharply, but exquisitely cut, his literary manner of doing it seems closer to sculpture than to painting. His words, like strokes of the chisel, follow each other to eliminate thought; he makes his phrase exquisite, or he makes it grand—sometimes rude and brutal, as if in fury. He seldom fills his outline, and but rarely places his subject before us in full color and with delicious melting outlines, like Gautier or like De Musset, or like George Sand, whose style suggests all the flowing harmony and undulating rhythm of music—but, on the contrary, oftenest like a sculptor, like a medallist. For this reason his phrases do not easily lose their distinctive character in the translation, but strike the English reader with much of the same decided, graphic, incisive, and bold form of the original. Victor Hugo is the only writer whose style suggests that of the great Florentine sculptor. We might say he has formed his literary manner on the works of Michael Angelo and the mediæval sculptors. But it would misrepresent his genius to limit it under this classification, justly expressive as it is of his leading artistic trait. There are pages of “*Les Misérables*” which are light and full of color as a Watteau; his “*Lucrèce Borgia*” has the grave and profound tone of a picture by Delacroix; his “*Gavroche*” is like a sketch by Gavarni. All this is but a suggestion of the varied manifestations of his genius, and of the adaptation of his talent to his subject. Picturesque and sculptural, he seems beyond any other writer. He fails only to reach the harmonious and impassioned expression which should associate his name with Beethoven, as is George Sand’s. Thus far unity and fusion of power seem the only things wanting to his prodigious genius.

Victor Hugo has what no English writer since Jeremy Taylor has exhibited—that is, *fantasie*. He has what no English writer but Carlyle has manifested—that is, literary audacity; he has the historical sense of art which Browning alone, among English poets, has shown in striking and adequate language; and he has incessantly and vigorously expressed his comprehensive love for humanity, and preoccupation with the cause of the people in a literary form, unequalled for power and boldness of expression by any English author. He has been one of the foremost literary figures in France for the last thirty years, the object of fierce animosity, the leader of talented partisans, the confessed master of a new literary school. His intellectual and moral life has literally been passed in the midst of revolutions. The unity and harmony he lacks as an artist have been wanting to France. The fervid sympathy, the mental audacity, the moral temerity he has shown, mark him as a man outside of the furnished house of tradition, but initiated to all human experience; the last expression of the convulsed and struggling spirit of humanity, and preferring revolted life to lifeless art; giving the ascendancy to the man rather than to the artist. His creative faculty seems marvellous and inexhaustible, not subject to the rules of antique art, but obeying its own impulses and triumphing by force of energetic conception.

Victor Hugo continues to live as an exile on the Island of Guernsey, which lies at the entrance of the English Channel. From his house he dispenses charity to the poor and unfortunate, and gives a Christmas dinner to indigent children of the island—in every practical way illustrates his exalted and earnest sentiment of Christianity. He is, in one word, a grand and tender man, solicitous for the humblest and the peer of the greatest contemporary.

His residence, Hauteville House, which is a remarkable illustration of his *bizarre* taste, has a very complex and picturesque interior. With its inscriptions in Latin and French, its tapestries and statues and pictures, its furniture selected from various epochs, it seems as unique as the genius of its master. All description is inadequate to suggest the actual aspect of the rooms, unless accompanied by such etchings as were published by Cadart, in the little book entitled *Chez Victor Hugo, par un passant, avec 12 eaux-fortes, par M. Maxime Lalanne*. The full description of his home and habits has so recently been given in

English and American publications, based on the letter-press of Lalanne’s little book, that we shall not venture a repetition of the matter. But we have again the opportunity to renew our acquaintance with his genius and contemplate its latest phase of expression.

### WHY WE SLEEP.

IT is related that a Chinese merchant, having been convicted of murdering his wife, the judges determined to punish him in such a manner as to inflict the utmost amount of suffering, and, at the same time, strike terror into the hearts of all those who might entertain the idea of following his example. He was, accordingly, condemned to die by being deprived of sleep. The prisoner was placed in confinement under the care of three of the police guard, who relieved each other every alternate hour, and were instructed to supply him with a full allowance of food and drink, but who prevented him falling asleep night or day. At first the condemned man congratulated himself on the mildness of his punishment, and was rather disposed to regard the whole matter as a joke. The excitement of his situation tended to keep him awake, and for a day or so his guards had little to do. By the third day, however, he began to feel very uncomfortable. His eyes were red, his mouth parched, his skin dry and hot, and his head ached. These symptoms continued to increase in intensity, and at the commencement of the eighth day his sufferings were so acute that he was at times delirious. In his moments of reason he begged the authorities to put an end to his torture. He implored them to grant him the blessed opportunity of being strangled, guillotined, burned to death, drowned, garroted, shot, quartered, blown up with gunpowder, cut into small pieces, or killed in any conceivable way their humanity or ferocity might suggest. All was in vain—his tormentors coolly did their work till there was no occasion for their interference. A period was reached at which he could not have slept even if let alone. The brain was feeding on the products of its own disintegration, and sleep was impossible. He was now entirely insane. Illusions of his sight and hearing were almost constant, and erroneous fancies filled his thoughts. At one moment he fought his guards with all the fury of a maniac; at the next he cowered with terror before some imaginary monster, and then, relapsing into calmness, would smile with delight at some enchanting vision which flitted through his mind. Finally, nature gave way altogether. He lay upon the floor of his prison, breathing slowly and heavily, stupor ensued, and, on the nineteenth day, death released him from his sufferings.

The story is probably founded on fact, for, of all the nations who have cultivated the subject of punishments as a science, the Chinese stand among the first.

But the question arises, Why should the mere deprivation of sleep be productive of such a degree of torture as to make the victim beg for some more speedy and apparently more horrible death? The answer involves certain facts connected with the physiology of sleep, which, if generally understood and acted upon by those who make much use of their brains, would do a great deal toward lessening the population of our insane asylums.

The brain is the organ which evolves the mind. To perform its function, it requires to be supplied with a sufficient quantity of good blood. In this respect it does not differ from any other organ of the body. If the liver be deprived of blood, the secretion of bile stops; if the vital fluid be cut off from the stomach, there will be no more gastric juice; if the renal vessels be tied or divided, the action of the kidneys is at once arrested.

Now, within certain limits, the more blood there is in the brain, the more energetically does it work in the production of mind. If the proper limit, however, be passed, and especially if the blood be “black” or non-aerated, the manifestations of mental action become abnormal, and may altogether cease

through the stupor caused by congestion. In all these respects the brain is submitted to the same laws that govern the other organs. A moderate increase in the activity of the circulation in the gastric vessels leads to an augmentation in the quantity of gastric juice, and thus digestion is accelerated. A like cause acting upon the liver promotes the secretion of bile, and so on for the other organs. Let the Rubicon of healthy activity be passed, and the vessels become unduly overloaded, and we have bad gastric juice or bile, as the case may be, and, perhaps, none at all.

Mankind have found out certain ways of increasing the amount of blood in their organs, and thus of producing results which they deem beneficial or necessary. Thus, to help digestion, we eat cayenne pepper, mustard, and other condiments, or follow Paul's advice to Timothy, and take a little wine for our stomach's sake. When the mother's breast fails in nourishment for her babe, we employ medicines which have the effect of reopening the fountains, simply by their influence on the circulation of the blood; where it is deemed necessary to increase the amount of saliva, and thus to eliminate certain poisons from the system, we "salivate" our patients with mercury—or, rather, we did, few of us do so now. The glands become enlarged by the increased amount of blood in their tissues, and the saliva is poured out in torrents.

We know, too, how to increase the amount of blood in our brains, and thus to add to the number and brilliancy of our thoughts. A glass of wine by its action upon the heart, causes it to beat with more force and frequency, and appears to especially act upon the cerebral circulation. Eugene Sue never wrote without a bottle of champagne by his side, from which he imbibed a great part of his genius. Others take opium for the same purpose; and others again resort to still more dangerous means. One of the most effectual and safest is a cup of strong coffee. Sydney Smith said, "If you want to improve your understanding, drink coffee;" and Sir James Mackintosh used to declare that he believed the difference between one man and another was produced by the quantity of coffee they drank.

Then, again, the quantity of blood in the brain is increased by those portions of the body which mechanically favor its entrance into the cranium, or retard its exit. Many persons have noticed the influence of position on the activity of thought. Pope used to lie awake at night thinking, and, when a particularly brilliant thought occurred, would ring for pens, ink, and paper, in order that he might record it ere it was lost. The engineer Brindley used to retire to bed for a day or two, when he was reflecting on a grand or scientific project. Sir Walter Scott has said that the half hour passed in bed, after waking in the morning, was the part of the day during which he conceived his best thoughts. Tissot states that a gentleman, remarkable for his accuracy in calculation, for a wager, lay down in a bed and wrought by mere strength of memory a question in geometrical progression, while another person in another apartment performed the same operation with pen and ink. When both had finished, the one who had worked mentally repeated his product, which amounted to sixteen figures, and, insisting that the other gentleman was wrong, desired him to read over his different products. On this being done, he pointed out the place where the first mistake lay, and which had run through the whole. He paid very dearly, however, for gaining his wager, as for a considerable time he had a swimming in his head, pains in his eyes, and severe headaches upon attempting any mathematical labor. A gentleman has recently told the author that, whenever he is at a loss for ideas in his literary compositions, he lies down on a lounge, and always with good results.

But the blood in the brain may be increased by its own action. Intense and long-continued thought, anxiety, grief, and other emotions, have this effect. It may be laid down as a law admitting of no exception, that, when an organ is kept in a condition of great activity, there is an augmented flow of blood to its substance; and the organ, whatever it is, increases somewhat in size when an increase is possible. Take, for example,

the arm of a blacksmith, or the leg of a ballet-dancer. Here the excessive use to which the muscles are put causes an increased flow of blood to the part, and the consequent formation of new matter in greater proportion than it is consumed.

There can be no muscular action, except as the consequence of the disintegration of a certain amount of muscular tissue. No gland can act without its substance becoming decomposed to some extent, and no thought can be conceived by the brain without the destruction of a definite amount of the cerebral matter.

During wakefulness, the brain is constantly in action. There is not a moment during which it is entirely quiescent. If our thoughts are active, or if strong emotions act upon us, the blood flows in increased amount to the head, in order that new matter may be deposited to take the place of that which has been used. For all new substance, whether of the heart or the lungs, or the brain, or the muscles, or the nerves, comes from the blood.

In the ordinary course of our lives the supply is equal to the demand. But it is possible so to use our brains that the substance is destroyed in a greater proportion than the blood can supply. Men engaged in the feverish and anxious occupations of life rarely stop to think that they are using their brain capital, instead of merely consuming the interest, as they ought to do. The end for all such is not far distant. It is as certain as the result of spending a pecuniary capital instead of living upon the income. The one will inevitably lead to insanity or a lunatic asylum; the other to pauperism and the almshouse.

Now, what has all this to do with the question, Why do we sleep? Simply this: sleep is the rest of the body, and especially of the brain. During this condition the brain is at its minimum of activity. Certain faculties, such as the imagination, appear to be in full operation, but it is in appearance only, for those faculties which regulate it when we are awake have their actions suspended. All other organs have their periods of rest during wakefulness, except the brain. Sleep is essentially the condition in which the noblest organ of the body reposes from its labors. It is then that the blood deposits new cerebral matter faster than it is used, and thus prepares the brain for its new duties when we awake.

If we take the hours which should be devoted to sleep and use them in mental activity, we are robbing our brains of the opportunity for regeneration which the condition of sleep affords. We are surely consuming our capital, brain—and intellectual bankruptcy is the certain result. If we persevere, the time is reached when we cannot sleep. For the cerebral vessels become so permanently distended that sleep is an impossibility.

It used to be thought that during sleep there was an increase in the quantity of blood circulating through the brain, but very exact observations have satisfied us that the reverse is the case. Wakefulness, therefore, keeps the cerebral vessels distended, a state of congestion is thus induced, the blood is not rich enough in the substances the brain requires to supply its wants, and this organ accordingly consumes its tissue for the restoration of mind, without the possibility of sufficient deposits being made to compensate for the loss.

Is it a matter for surprise that, under such circumstances, the brain should act badly, and that the manifestations of mental action should exhibit irregularity and disorder? Is it a wonder that a man who has passed a sleepless night should be unable to transact his business properly the next day, or even to add up a column of figures correctly? Is it strange that his head should feel dull and heavy, that he cannot collect his thoughts, or even concentrate his attention upon matters requiring deliberation? Let this go on night after night, and organic diseases of the brain, such as insanity, inflammation, or softening, are certain to result. We sleep, therefore, mainly to give the brain rest. One-third of our lives should be devoted to this purpose. If this is done, it matters not how constantly or intensely we employ that organ which, in its noblest proportions and in its fullest vigor, makes man what he is.

"LOVE THY NEIGHBOR."—BY RICHARD HENRY STODDARD.

"'Love thy neighbor as thyself.'—  
 When at dawn I meet her,  
 As by the garden wall she stands,  
 And gives me flowers across the wall,  
 My heart goes out to kiss her hands—  
 —Are hands or flowers the sweeter?—  
 I'm ready at her feet to fall,  
 Or like a clown to labor!—  
 Better than I love myself  
 Do I love my neighbor."

"'Love thy neighbor as thyself.'—  
 When at dawn I meet him,  
 As by the garden wall he stands,  
 And takes my flowers across the wall,  
 My soul's already in his hands—  
 It flew so fast to greet him!  
 And oh, I grow so proud and tall,  
 And my heart beats like a tabor!—  
 Better than I love myself  
 Do I love my neighbor."

## LINKED TO A STAR.

IN making public the great sorrow of my life, I will speak briefly and plainly. No amplification, no graces of writing that I possess, can move the reader's compassion, if this unadorned narrative fails to. If any one asks why I come before the world with my sad story, I answer that I desire the world's sympathy. It relieves me to unbolem myself to the widest audience that will give me a hearing.

Once and for all, I do not believe in the supernatural explanation which some excellent people—most of them ladies—who personally knew of the occurrences here set down, attach to them. I hold them to be coincidences only. But upon me they have had an effect as controlling as if the Deity had made to me a special revelation. This is my candid statement, as I look back to the mysterious events, across the dreary interval of two and a half years.

I am, and have been for a long time, head book-keeper in a great dry-goods house in the city—a plain, matter-of-fact man, of whom I will say no more here than that the gray which thickly studs my hair is not a mark of age, but of disappointment and grief.

I live where I was born, in a hallowed old house, about twenty miles up the river. Trains run to and from the city many times a day, so that my home is quite as convenient to business as a residence in town. My mother and two sisters occupy this house with me. It has fair grounds about it and some noble old trees, and commands a distant view of the river. The outlook from the roof is very fine. You can see for miles in every direction. At night, owing to the high altitude and the purity of the air, such an expanse of dark-blue sky, fretted with myriads of golden fires, overhangs us, as I have never seen save out upon the Sound.

Among my father's effects was a six-foot achromatic telescope of Fraunhofer's make—an old instrument which had strayed across the Atlantic after a life of unknown vicissitudes, and got into an auction-shop in the city, where my father chanced to see it, and bought it to look at remote objects with, principally at sails far up and down the river. Its performance, for a land telescope, was unequalled by any instrument I have ever seen. Names of schooners, sloops, and barges, could easily be made out, eight to ten miles off. But it was in astronomical observations that I, as boy and man, tested its remarkable powers most thoroughly, and derived the greatest pleasure from its use. The possession of this glass made of me an amateur astronomer. Other people find a hobby in chess, or billiards, or Shakespeare, or philosophy, or a hot-house. My amusement, on returning from the dull mechanics of book-keeping every night to my country home, was to bring out the battered brass-and-leather tube as soon as dark set in, and con the heavens. I rebuilt the cupola of our house into a sort of an astronomical observatory, by heightening and widening it so as to allow the free swing of my long telescope, and putting on a light movable roof, which could be slid off and back again by the pull of a cord. The sides were a mass of windows, so contrived that I could lower them at pleasure into the roof beneath me, out of the way. In this airy loft, long after the other members of my family had gone to bed, have I spent hours that spun by like minutes, so lost was I in the ecstatic contemplation of celestial wonders. Many a night have I watched in the morning-star, and made up for loss of sleep by naps in the cars. Occasionally I have been found nodding on my high stool in the office, and then there were sly jokes about where I had been the night before. I never let out the secret of my observatory but to a few of my most intimate city acquaintance: for there was a general disposition, I soon discovered, to make fun of my innocent nocturnal pursuits. Several of my dearest friends called me "highly eccentric;" and one, whose good opinion I greatly valued, did not hesitate to pronounce me "moonstruck."

For two years previous to May, 1866—memorable year and month in my history—I had been engaged to Milly Estwick, the only daughter of a neighbor of ours. From childhood we had known and loved each other. Ours was the first love, which sometimes is the true love, the love that outlasts all. She was a handsome girl, sweetly disposed, and, in quiet, simple, home-loving tastes, much resembled me. We should have married soon after I put the golden pledge upon her dear hand, but for the delicate state of her health. She was a slender creature, having in excess that spiritual organization so often found in American girls. Manlike, I was anxious to wed at once, and be off on a journey for her health and pleasure. Womanlike, she preferred to wait.

Much of our courtship was carried on in the open air, beneath

the pavilion of stars. It was the poetry of heaven that moved me first to the point of proposing; and the eternal, countless eyes above us witnessed the sweet registry of our mutual vows. Many a pleasant summer evening, after our betrothal, would she sit with me for hours in my observatory, and watch for transient meteors, or look through the telescope at objects which I would select, the moons of Jupiter, Saturn's ring and satellites, binary stars, nebulae, and the like. The glass was mounted on an ingenious frame, of my own contrivance, and while we sat side by side, very close, in our easy-chairs, I could turn the instrument, with the merest finger-touch, to any quarter of the skies. For both of us it was heaven above and heaven below.

Milly took but little interest in astronomy as a science. She said it made her head ache to think of the stupendous size and vast distances of the heavenly orbs. She feared, too, to detach her mind from thoughts of the pleasant earth, where she had so many devoted friends, whose love and tenderness were but the reflex of her own soft and loving nature. The stars appealed somewhat to her religious sensibilities. But she admired them most—let me say it at once—for the same reason that swayed the minds of the wisest and best in the olden times, and even now has not been banished, and perhaps never will be, by the decrees of knowledge. She believed the stars had some influence on mortal affairs. She thought they might be the homes of our future lives. This notion, so poetical and beautiful, although I thought it absurd, I did not try to laugh out of her. Nor to disprove it—as how could I have done? No! I loved her all the more for her childish superstitions.

On the night of May 11, 1866, Milly and I were up in the cupola. My mother and sisters had been with us the greater part of the evening, but had withdrawn to the parlor, on some plausible pretext or other, but really, I dare say, to leave Milly and me together. Since we were engaged, they had often benevolently done this.

The night was mild and beautiful. A south wind brought to us the odor of blossoms. The first wood-crickets of the season chirped on every side. There was no moon; but the light of a multitude of stars, on the steel-blue ground of sky, made outlines of objects near me quite visible. I could see, or thought I could, the violet of Milly's sweet eyes; the deep chestnut of her hair; the little dimples in her cheeks. She was paler than usual that night. I knew, by her little nervous thrills, that she suffered from some internal pain. But in vain I asked her to join my mother and sisters below. She said she was very comfortable there, and would stay a while longer. We had been roving idly among the stars, and chatting a good deal about ourselves, though there was one topic very near to both of us, which, by common consent, we never alluded to. That was my darling's heart-affection. Neither of us dared to talk of it. We both silently hoped that the dangerous symptoms which it had shown would disappear in good time. That malady was the spectre, as from the grave, that rose between us often in our gayest moments.

I folded her shawl more closely about her, for I somehow fancied she was chilled with the night air. Then said I, with a light laugh, and a Claude Melnotte-ish air, "Come now, Milly, tell me 'what star shall be our home, when love itself becomes immortal.'"

"Are you in earnest, Albert?" said Milly, more seriously than I had expected.

"Of course, darling. Only let it be one of the first magnitude. No second-class for you and me in cars, hotels, or stars. There are Aldebaran, Regulus, Arcturus, Capella, Denebola, Lyra, and plenty more of them. Which, now?"

Milly glanced about the heavens a few moments. Her gaze suddenly became fixed on the beautiful constellation Corona, then looming in the northeastern sky. Her face seemed to light up with a look of decision, as she exclaimed: "There, that's our star!"

Her small white hand indicated the glittering Crown.

We were so used to pointing out stars to each other, that I knew instantly which she meant.

"I see it, dear. The one with the soft white light, changing a little as I look at it to a faint yellow, and perhaps a blue. 'Tis only of a second magnitude. I am disappointed."

"Nevertheless, Albert, 'tis our star. What is its name?"

I looked at the star attentively, taking its bearings from other well-known stars in the vicinity. "This is very strange, Milly," said I, "but I don't remember ever seeing that star before. 'Tis a fixed star, you see, by its sharp, flickering light; not a planet or a tailless comet. How does it happen, then, after all my studying of the heavens and

Herschel's catalogue, till I thought I had both by heart, that I can't name that star?"

"Perhaps it's a new star," said Milly, still gazing at it intently.

"Impossible," I laughingly replied. "We can't have new stars made for us expressly, you know. Yet it may be new in one sense," I added, more seriously, "that is, a variable star, reappearing after years of obscurity. I will look at the catalogue when we go downstairs. Meanwhile we'll call it new, and we'll christen it 'Milly,' your star."

"Our star, Albert."

I was about to respond with some pleasant jest, when I marked a deepening pallor, like a faint auroral cloud, pass over her face.

Star and telescope were forgotten in an instant. The phantom rose between us! "Darling," said I, "you are ill. I knew this night air would hurt you. Let us descend."

Her eyes were still fixed, rapt upon the soft, white star. I was obliged to take her gently by the arms, and move her to the trap-door, whence a safe flight of steps led to the attic. She obeyed me silently, like one in a trance; but, to the last, before we had passed through the roof, her backward gaze rested upon that star.

By the time we joined my mother and sisters in the parlor, she was better. "Only a passing faintness," she said. In a little while she recovered her usual spirits; and I accompanied her home to her father's house, which was but a stone's throw from us. As we went into the open air, I rejoiced to see that a fleecy cloud covered the Northern Crown, for I felt there were mysterious reasons why we should not look at that constellation. She glanced up at the sky, but said nothing.

I gave her the parting kiss at her father's door—how sweet it comes back to my memory!—and hastened home, and up to the roof, with a lantern and Herschel's catalogue in hand, to solve the riddle of the star. But clouds had gathered for the night, and after waiting fully three hours for some rift to open up through which I might have glimpses of the Crown and of "Milly" (as I fondly called the unknown), I took in my telescope and went to bed. But long I lay awake, pondering perplexedly, sadly, over the strange incident of the evening.

Next day, my thoughts so ran on the star and my betrothed—for the two came into my head together, as if they were inseparable—that I made several mistakes in the ledger. May 12, 1866, is scored with more penknife scratches in my accounts than any other whole month of that year.

At last—how slow time dragged, and how snail-like the cars crept up the Hudson shore!—at last I was at home again. On my way to the house I always called on Milly. That evening (the sun had not yet gone down) she was sitting by an open window, where she often sat, looking right between two great lilac-trees, heavy with pink-white masses, watching for me. I ran to the window to greet her. Ah! how pale, but how beautiful! Her eyes had the introverted look of meditation. They did not seem to see me, but some point in space just short of me.

"You are not well, dear," said she, plaintively.

The very words I would have spoken to her! but I dared not utter them.

"Something has troubled you to-day, Albert. Our star, perhaps," she said, smiling, at the same time looking over the lilac-tops to the sky, where Corona would be in an hour.

I made a poor attempt to laugh. "Not much time to think about stars in town," said I. "The ledger is my only atlas there. One star more or less, where there are millions, is nothing to me, you know; but the mistake of a cent in balancing—that's every thing. I've been very busy to-day."

Then, to change the subject, I handed her a new volume of poetry, that I had bought for her. This effectually diverted her thoughts—or seemed to do so—from the unpleasant subject. I leaned over the window-sill, so that my cheek almost touched hers, and we turned the pages of the book together, glancing at the principal poems. One was headed "Lines to a Star." She paused, as if to read them.

"Let me show you a lovely ode further on," said I, and I thumbed a dozen pages impatiently. Milly looked up and smiled. But I pretended not to understand her. Presently I found what I wanted, and read the poem to her in a low monotone. What it was all about, I know not, at this time. My thoughts, all the while, were only of her and her namesake up in the sky.

The sun was then setting, and Milly, always thoughtful of others, said I must go home to supper, for mother and sisters were waiting for me.

I was less reluctant to leave her than usual, for I burned with a desire to solve that star-problem.

"Let me shut the window for you," said I.

"Oh, no, Albert! Leave it open." Again the skyward glance, as she spoke!

"Then, good-night, good-night, Milly. God bless you!" I kissed her hand, and hurried away, just as the twilight began to gloom softly.

Supper was dispatched mechanically. I chatted at random with mother and sisters. They knew that I was sad about Milly's declining health, and I knew that that made them unhappy. We shunned that subject of all others.

Almost rudely pushing my plate aside, I excused myself and ran up to the observatory. I carefully wiped the glasses of my telescope and placed it in position. In the chair which she was wont to occupy, I spread out Herschel's catalogue, its pages open at the Corona constellation. The lantern, newly filled and freshly trimmed, stood by its side, shedding a clear light upon the text. I seated myself, my hand resting on the drawn tube of the instrument and caressing it. I trembled with impatience as I strained my gaze to the northeastern sky. One by one the brightest stars in that region began to appear. Presently, under my fascinated eyes, the Crown came out, gemming the blue with its brilliant points; and, set in the midst of them, the soft, white star. The moment I could identify it beyond a doubt, I turned to Herschel, as to a book of fate.

*Great Heavens! There was no such star upon the list!*

The import of the mystery flashed upon me like the gleam of a meteor. *Milly had discovered a new star.*

Truly, it was our star, as she had said—ours by right of finding. We were entitled to name it. The star was *Milly*, as regularly christened as ever child brought to font.

Let me be frank. For the first time in my life a feeling of superstitious awe crept over me. Was there more in the old astrology than credulity and imposture? But I did not allow this unscientific thought to keep ascendant long. I recalled all I knew of stars suddenly appearing, of variable stars, in Ophiuchus, in Scorpio, in Cassiopeia, Hercules, and other constellations. I remembered the theories that explained the prodigy, and gradually became calmer. We had made a great discovery surely; but dozens of other observers might have made it the same night, for aught we knew. Accident only had determined Milly's selection of that particular star. Its light, rather softer and purer than that of other stars in the neighborhood, had guided her choice. I felt proud for Milly and myself, but I laughed outright as I thought of the poor child's simplicity. The idea of a star, billions of miles away, being any earth-born creature's future home! The delicious absurdity of it made me love Milly all the more. "What is the darling doing now, I wonder?"

My blood suddenly chilled in my veins as I thought, "*She is at this moment looking at our star.*"

Mastering with an effort this mysterious and unpleasant fancy, I addressed myself to the scientific examination of the star, so far as I, a mere amateur, was capable of such a task. By this time the night was quite dark, and I now discovered that the star was not so brilliant as it had been the night before. From a full second magnitude, it had dropped at least half-way to a third. My experience in studying stars enabled me to detect this to a certainty. It was strange, but, after all, in accordance with the phenomena of recorded variables. Their brilliancy culminates and wanes in many cases with surprising rapidity. We had first seen it at its maximum; it was now on the decline. The flicker into a yellowish and bluish tint was noticeable, as on the night of the 11th. Some stupendous chemical action going on. Possibly, the burning out of the star! Who knows?

I levelled my telescope at this wonderful object. Like all other fixed stars seen through clear glasses, it became apparently smaller than when viewed by the naked eye—a diamond-point only. But the color coming and going on the white was distinctly visible.

How long I sat at this scrutiny, I cannot tell. The voice of sister Hetty from the stairs called me back to earth.

"A note from Mrs. Estwick, Albert."

I seized it as she thrust it through the opening in the roof, tore away the envelope, and read:

"DEAR ALBERT,—Milly wants to see you very much. Come over at once.  
Affectionately yours,

"S. E."

I presented myself at Mr. Estwick's house as quickly as I could. Milly sat by the window, shut now, where I had left her. Her face was turned toward the northeastern sky. She did not see me as I approached through the darkness. A thick-set figure came out of the house as I was about to enter. I recognized Dr. Plimpton, the family physician.

"How is she, doctor?" I asked, hurriedly.

"Ah! Mr. Champfield, I'm glad you've come. You'll do her more good than all my medicines. She fainted to-night—though that is nothing new for her, you know—but she came out of it rather weaker than usual. Strange diseases, sir, those affections of the heart. The patients' nervous sensibility and spiritual perception are wonderfully increased. I sometimes think they have the power of looking into the world we call unseen, upon whose threshold they always stand—"

I cut short the doctor's disquisition—"Tell me, can she be saved?" I clasped his honest right hand, as if I would wring a favorable answer from him.

"I hope so; but God only knows. You can save her, if any one can."

Without another word, I rushed into the house, and the good doctor walked off to visit another patient.

"Ah! Albert, I am so glad to see you," Milly said, extending both hands to me. I clasped and kissed them.

Mr. and Mrs. Estwick, who loved me like their own son, gave me a warm greeting, and, after a few commonplace remarks, left Milly and me together.

The moment we were alone, the dear girl said: "Our star has faded a little from its lustre, last night, and I have faded too." She smiled, and looked up at it. "We are going out together."

I recalled what Dr. Plimpton had just said, and a sense of terror thrilled me. But I conjured up a feeble laugh, and replied: "Oh, no, darling! that's mere fancy. If you had seen the star from my observatory, you would have said it was brighter than on yesterday night."

Heaven pardon me the deception, but what would I not have done for her!

She had watched my eyes closely as I spoke. "Now I know you are just fibbing a little bit," she, smiling, said. "Don't fear to tell me the truth, Albert. Our star is becoming fainter."

I could not lie as I looked into her pure, loving eyes. "Well, Milly, it has dwindled a little, perhaps. But what of it? The star is a variable, which we happen to have seen at its brightest. The light has been waxing up to the degree of last night—its maximum, perhaps—and is now waning. You know, dear, I told you all about this strange kind of stars long ago. We cannot explain the phenomenon, but one thing we may be sure of, it has no influence, good or bad, on the inhabitants of this speck of a planet."

Milly answered not, but only looked out of the window. My eyes followed hers, and I gladly saw that Corona had at last passed from our field of vision.

"Is it really a new star, as you thought, Albert?"

"My catalogue does not give it," said I. "For us it is new, at any rate, though other observers may have seen it the same night that we did, or before it. These astronomical novelties are generally discovered by a number of people in different parts of the world about the same time. I will watch the scientific items in the papers, and see what they say. Till further notice, however, we will call the star 'MILLY.'"

I was sorry afterward that I said this, for her eyes shone with strange intensity as I coupled her name with the celestial stranger.

"As you watch this star fading from night to night, you will think of me, Albert, will you not?"

"Surely I will, dearest, and hope and pray that you will become stronger and better. But leave the watching to me, Milly. Promise me that you will not worry any more about this star, will you?"

"I do not worry," she said, with her pleasant smile. "I take a calm, sweet pleasure in looking at it, for I know that you and I are linked to it forever. As long as I can sit at this window, I shall feel more contented and happy to see our star, and feel in my heart and soul that it is ours."

Morbid, incomprehensible fancy! Too deeply rooted in her mind to be disturbed by any arguments that I could ply upon her. Dr. Plimpton's words resounded in my ears. I felt sick at heart.

Thankful was I that, before this painful subject could be renewed, Mrs. Estwick entered the room. I accepted her appearance as a hint that our interview had lasted long enough, and a few minutes after I withdrew, promising to call morning and night, to see with my own eyes how fast Milly got better—a promise quite unnecessary, for I had called that often for about two years.

Blessed hope, that can cheat us against the conviction of our own senses! For I knew my Milly was dying.

I have no heart to protract this story.

Information which I gathered from many sources in various ways proved that Milly and I were probably the first persons anywhere who took notice of this star.

On the 12th of May, the night following our discovery (if I may so call it), the new star was seen and examined at the Washington Observatory; on the night of the 14th, at Cambridge, Mass. Astronomers in England and Ireland saw it on the 12th, and the next night some French astronomer made record of it. Reports were afloat that it had been seen in Canada and elsewhere during the early part of May, when its brightness was between the third and fourth magnitude; but these reports I am unable to verify. It further appeared that several maps and catalogues of old dates testified to the existence of a small star, below the ninth magnitude, at or near the position occupied by the mysterious object; but there was no evidence to show that the two were identical. While it may have been a star "burning up," as the popular phrase is, the opinion of the majority of astronomers inclines to the belief that it was a variable, seen in its highest effulgence at intervals perhaps of hundreds of years, like the well-known one in Scorpio.

Night after night its lustre steadily and rapidly decreased. On the 14th, it was of the third magnitude, or below it. On the 19th, it was of the fifth.

These changes startled me only as they coincided, in the most remarkable manner, with Milly's declining health. As the star diminished, so the roundness of her fair cheeks fell away, her sweet voice became fainter; only the brightness of her violet eyes seemed undimmed, or even to be heightened, as she faded.

I attended to my dull work in the city as best I could—reaching the end of my labors every night through Heaven knows what tangles of mistakes—and hurried home by the first evening train.

The star being visible up to the night of May 19th to the naked eye, I did not use my telescope upon it. I had no taste for astronomy during those dreadful days. I came at last to curse the star, because of its malign influence upon my fate—though my sober reflection always rejected that supposition as weak and unworthy of me. But, reason as I would, the mournful fact remained that Milly and the star were receding from me together.

Morning and evening I was by her side. She was still able to sit up; and occupied her chair in the old place by the window. The good doctor had reluctantly told me there was no hope for her recovery; that the least excitement, even that attending her removal from room to room, might at any moment end her frail life. Her father and mother had not dared to ask of the doctor his final opinion, and they still trusted, with blind confidence, that she would mend in a few days. Milly herself would not talk of her approaching death to them or to me; but I knew by a hundred little signs and tokens, voiceless many of them, that she wished me to be prepared for the event that must come. Knowing that every allusion to the star pained me, because of its intimate association in my mind with her, she had not spoken of it to me for some days. She had seen, with her own eyes, that its radiance was fast being quenched.

On the morning of the 20th, a thought occurred to me from which I derived momentary relief. I had observed, on the night of the 19th, that the star verged so closely on invisibility that another twenty-four hours would remove it from human sight. The idea possessed me that if she could be kept in ignorance of the disappearance of the star for a day or two after it had taken place, she would then have a clear proof that her life did not depend upon it. I determined to practise a harmless *ruse* upon her. I would deceive her for her good; perhaps save her life by dispelling what I believed to be a hallucination.

I had taken later trains than usual to town since her serious illness. That morning, when I presented myself at her house about half-past eight o'clock, I found her sitting in her accustomed chair and looking better. Her parents and even Dr. Plimpton also remarked the improvement; and we all took heart from it.

"Milly," said I, as soon as we were alone, putting on a brazen face for the deceit, "I've good news for you. Your star is brightening. There was a perceptible increase in its lustre between ten and two o'clock last night. And you are brighter too, thank Heaven!"

The effect on the dear girl was not what I had expected. She simply said, "You must not be deceived by appearances."

But I would not listen to any thing that would dash the joyous hope which rose within me. "This star has begun to shine out again, and so will you, dearest. I know it."

Though decidedly improved to the eye, I noticed that conversation and the exertion of thinking fatigued her that morning to a marked degree. So, after dispensing what I could of my assumed cheerfulness to the patient, and telling her how much better yet I was sure of finding her when I came home that night, I bade her farewell.

We were alone at that sacred moment; and I stooped down and printed the kiss of immortal love upon her lips.

"Good-by, Albert," said she, pressing my hand, as if desirous to detain me longer. But this she always did.

"Good-by, sweetest!" and so I retired from the room, her violet eyes bending upon me to the last their angelic look.

"Now," thought I, as I walked fast to the station, "if Heaven will but send a storm of three or four days, so that she cannot see the star! At all events, on one pretext or another—and love will find many for me—she must be kept from seeing it. All the time, if the nights are clear, I will make her believe that I have watched it, and that it is flaming out more and more. Then, after her health has improved a little, I will frankly acknowledge the deceit, and so explode forever the deadly illusion that haunts her."

Such was my poor plan; and the elaboration of it, in all its parts, cheered my drooping spirits at the desk, where I went through my appointed work like an automatic adding-machine.

The sky was clear when I reached the little village that night. I almost ran from the station to Mr. Estwick's, turning over and over, as I dashed along, the various plans by which she might be kept from gazing at the star, and made to believe my pious frauds about it.

She was not at the window. That was ominous. And, through the panes, I could see a group of persons standing still together. She was worse—perhaps actually dying!

The dread doubt was solved in a moment as I knelt upon the floor by the sofa where she lay, cold and beautiful. *Dead, dead!*

I remember how all my manhood snapped like a thread under the awful tension; and how I wept as if my heart would literally break. I recall the well-meant condolences that relatives and friends, who stood about, addressed to me, and that each effort to soothe me touched a new fountain of tears. The last words of the poor child were "*Albert*," and "*our star*." She had died about five o'clock, suddenly and tranquilly—thank God for that! Her death had been, the doctor said, "A fading out, natural and painless."

The torrent of my grief finally spent itself, and I could look upon the face once so full of the fresh beauty of life—so lovely even in death—with something like composure. Years of my future would drag heavily; but they would end at last, and then we would be reunited in that world where is no more death, nor any sickness, nor any sorrow!

In our star! I rose upon an impulse and walked to the window. Darkness spread from point to point of the Northern Crown, like a pall hung upon golden nails. *Our star was no longer visible!*

"*I know that you and I are linked to it forever!*"

Such were her very words. Were they prophetic? or were these strange events only coincidences? to me it matters not. Explain them how I may, I feel that I am, from the very necessity of the case, linked to a star—a star now utterly withdrawn beyond the reaches of my telescope as of my mortal eyes. I cannot turn my glass to the sky at hours when that constellation is visible, without seeking the Crown and peering through it into the vast recesses beyond, in the faint hope that I may see the returning wanderer, my MILLY. Never again may that star shine on me in this fleshy tabernacle of mine; but the time will come—and this it is that cheers and sustains me—when, by my reunion with her, this burden of life shall be lifted, this mystery solved.

## MAY EVENING.

BY WILLIAM CULLEN BRYANT.

THE breath of spring-time, at this twilight hour,  
Comes through the gathering glooms,  
And bears the stolen sweets of many a flower  
Into my silent rooms.

Where hast thou wandered, gentle gale, to find  
The perfumes thou dost bring?  
By brooks, that through the wakening meadows wind,  
Or brink of rushy spring?

Or woodside, where, in little companies,  
The early wild flowers rise,  
Or sheltered lawn, where, 'mid encircling trees,  
May's warmest sunshine lies?

Now sleeps the humming-bird, that, in the sun,  
Wandered from bloom to bloom;  
Now, too, the weary bee, his day's work done,  
Rests in his waxen room.

Now every hovering insect to his place  
Beneath the leaves hath flown;  
And, through the long night-hours, the flowery race  
Are left to thee alone.

O'er the pale blossoms of the sassafras  
And o'er the spice-bush spray,  
Among the opening buds, thy breathings pass,  
And come embalmed away.

Yet there is sadness in thy soft caress,  
Wind of the blooming year!  
The gentle presence, that was wont to bless  
Thy coming, is not here.

Go, then; and yet I bid thee not repair,  
Thy gathered sweets to shed,  
Where pine and willow, in the evening air,  
Sigh o'er the buried dead.

Pass on to homes where cheerful voices sound  
And cheerful looks are cast,  
And where thou wakest, in thine airy round,  
No sorrow of the past.

And whisper, everywhere, that Earth renews  
Her beautiful array,  
Amid the darkness and the gathering dews,  
For the return of day.

## ABOUT WOMEN AND DRESS.

BY EUGENE BENSON.

EACH civilized epoch seems to have left us the husks of its taste in which to sheathe our softest flesh. The sweetest bud of Republicanism, the most *piquante* daughter of New England, the most dazzling dame of New York, promenades under such composite costumes, that we question whether she be infatuated with Chou Chou, Pompadour, or Eugénie.

Charming democrats we have in the women of the land. But how religiously they go out of it to seek their fashions! With what jealous reverence they shun the costume of the women of the Revolution, and how carefully they refrain from inventing or adopting a national and simple dress which we can look at without being reminded of the license, and corruption, and folly of Continental life!

Dress and decoration are wildly confused and meretriciously mixed. We can see but one dominant taste, that of the arbitrary and ostentatious. We cannot say with Landor's *Aspasia*, "Our dress is not the invention of the ignorant; but the sculptor, the painter, and the poet, have studied how best to adorn the most beautiful object of their contemplations." Women have retained the mark of barbarism in the use of ear-rings, and they still carry the glittering trophies of their conquests like savages, in metals and gems about their persons. But the most exquisite and civilized women have always preferred a flower to a gem; and, if they have not made a vow, like the most enchanting woman of antiquity, "never to wear any thing on the head but one single flower, one single wheat-ear, green or yellow, and ivy or vine leaves," they have appeared often enough so adorned to make the vow unnecessary.

Women live under the reign of fantasy. If most of our sisters are, like the Chinese, monotonous imitators of each other in the fashion of their dress, they break out in a riot of colors. If they cannot please, they can shock us by their use of color; and, *en masse*, they please us by their love of it. Like the variegated petals of flowers, they salute the eye or softly win the lingering glance of admiration by exquisiteness of hue. They instinctively feel that they belong to the floral sisterhood. In the spring they dress themselves in fresh and vivid colors; in the autumn they array themselves in scarlet, crimson, and orange, expressing the satisfaction and repletion of life. Quarrel as we may with the shape of the costume, with the vulgar excess of *trimming*, some bit of color about it will make us happy as savages, and we take off our hats to poppies, *blueets*, and violets; to asters, golden-rods, and cardinal-flowers; to roses, apple-blossoms, and lilacs. Some girls and women have their affinity in the floral world; they are the most charming of their sex; they are the human correspondence of some blossom that sheds its fragrance or dazzles with its glowing hue. Woman's *instinctive* taste for dress will express itself in harmony with the sentiment and color of the flower she loves. Yet, in saying this, we do not speak of the herd of women and girls without individuality; of that Chinese crowd of damsels and dames who never change the fashion of their dressmaker, and have not force of taste sufficient to originate a novel or picturesque effect of costume. These daughters of Mandarins case themselves, like a regiment of foolish virgins, in garments that look as if made by contract after one model, duplicated as fast as the skill of "fitters, cutters, and trimmers" can meet their reasonable and unreflecting passion of dress. Such foolish virgins are remarked only because of their numbers; they know nothing of dress as a fine art; they never appear before us like exquisite human incarnations of the toilless beauties of the woods, the gardens, and the meadows; they never walk the streets nor decorate homes to flatter the eye with color, and suggest redolent and delightful influences of purity, peace, and opulence. They neither understand their sex nor feel the artistic instinct of its life.

Man legislates, woman ornates. She is the first artist that Nature gave us. She plays with colors as a child does with flowers. She arranges, but she does not invent. With the exception of Miss Anthony and a few of her scattered and noisy sisters, she shuns abstractions. Instead of trying to remake our laws, she remakes her costume. The caprice of her nature and the extravagance of her fancy are lavished upon the garniture of her person. The advocates of the new social revolution of sex must first suppress the *artiste* in the woman before they can make her equal to legislative functions. Until they have destroyed the playful and charming child in the feminine sex they cannot lift it or abase it to the levelling and mechanical function of man, who substitutes a machine to impulse, and exhausts enthusiasm by patience.

If we look back to the centuries which are the glory and shame of our race, we see that men have shared the taste of women, have obeyed the passion of dress and decoration. But

now, less feminine, less artistic, less barbarous, they have wholly abandoned the art to women, and appear like undertakers and laborers. Since they have forsworn the enjoyment of an art inconsistent with their occupation, and have ceased to take pleasure in picturesque and gaudy or beautiful costumes for themselves, they have been contented with the extension of the passion of dress among women.

Democracy has transformed the appearance of men; it has not touched the nature or costume of women. They remain an exclusive and privileged class by all their instincts; with them license and art take refuge.

Modern civilization has made it possible for all women to display their love of dress and decoration. The confused and incongruous state of the art is to be attributed to the fact that it has been left wholly to the feminine mind, which, abandoned to itself, is lawless and craves for excitement. Dress, as an art, never, until our century, was wholly abandoned to one sex; and it never has been more varied and ostentatious among women than now. It has lost gravity and simplicity of effect; it is full of license, of dazzle, of display; it is sometimes exquisitely frivolous; oftenest it stifles the weak personality of our feeble women. But it has got rid of some barbarisms. The stiff *corsage* of De Medicis is obsolete; the pretty Parisienne has adopted the smallest and most flexible one to girdle her like the cestus of Venus. The Elizabethan frill, framing the head like a white cabbage, hiding the roundest neck and covering the most classic shoulders, is allowed to remain buried among the ceremonials of a stiff court. But, if we must adopt the fashions of our ancestors, why not go to Madame Recamier and claim her as our grandmother? Why not revive the long gauntlets, made to attract attention to beautiful arms? Why not take again her semi-Greek attire—the short waist, the narrow skirt, and the delicate ruffle, to hold all the charms of the girls and women of the land? Such costumes are made only for beautiful women—for women who converse without disputing; for women who neither toil nor spin, but, like the flowers of the field, refresh and charm by their mute and exquisite service in life. But this is a fancy picture—a bit of the past at best; it has gone with the heathen mythology, with the fairies of the North, with all the frail and bright imaginings of poets. We are in an industrial age, and dress and decoration are made for rough service, to arrest hurried and grasping men. Therefore the women of our cities are dressed like regiments; therefore they overload themselves with meaningless trimmings; therefore we have every thing but the simple and unobtrusive which charms us in pictures of Greek women, in the women of the French Revolution, in women of the time of Washington, in the contemporaries of Chateaubriand.

The much-abused classic painter David made a beautiful and simple costume fashionable in France. French women were never more exquisitely dressed than during his epoch. The mania for *trimmings*, which is most violent among American women, is of itself a sign of a corrupted taste—it does more than any other cause to retard the ascendancy of a pure and simple taste. Although women are so universally gifted with the artistic instinct, they have a touch of folly, a love of change, which prevents them from producing the finest results of the artistic faculty. They have lapses, they are dependent; they easily fall under the rule of arbitrary and dictating minds. An incurable frivolity, an unconquerable love of attracting attention, has always made them facile agents to propagate false taste, and render them insensible to the charm of the models of unostentatious epochs, of epochs truly gifted with the sentiment of beauty.

Dress and decoration no more receiving the attention of the serious and restrained minds of men, manifests the confusion and incongruity of the flighty and unrestrained minds of women. The feminine mind is incapable of originating a beautiful fashion. It is too receptive; it is too impressible. It goes through the ages to bring back a piece of patchwork. Women mix and

meddle and stimulate; they give to our streets and halls a variegated, flashing, exciting aspect, which at the best we may call brilliant and pictorial. They encourage artifice rather than art; they prefer crowded, ostentatious and novel things, for the artistic instinct, free from the masculine mind, is wilful and unreasoning; it asks only for excitement. If women have made so much confusion and ostentation in the domain of taste, left to themselves, would they increase the harmony of, and develop justice in, legislation? What answer?

## TO THE PUBLIC.

THE Publishing House by which the present Journal is issued has been extensively engaged, for nearly half a century, in the work of promoting general education, and diffusing information among the people of the United States, through the medium of valuable books, in all the leading departments of knowledge. In further pursuance of this important object, and recognizing the increasing tendency of the public to cultivate the periodical form of literature, the publishers have engaged in the enterprise of a Weekly Journal, which they design to make worthy of the liberal patronage of the reading community.

Omitting ordinary news, and avoiding partisan advocacy, both political and sectarian, the JOURNAL will be devoted to general literature, to science, art, and education, and to the diffusion of valuable information upon subjects of public importance. It is intended to make use of all resources, original and selected, domestic and foreign, which can give interest and variety to its pages; and neither exertion nor expense will be spared to secure the aid of the best talent of the time. We abstain from the large professions and the parade of conspicuous names so common on these occasions, and, trusting to the intelligence of the people, shall be content to let the Journal speak for itself.

## THE NEW EDUCATION.

UNDER the title of "The New Education," a writer in the *Atlantic Monthly* of February and March gives an account of the scientific and polytechnic institutions of this country, and what should be the preparation for entering them. Much of the information he offers is interesting, and he has several excellent suggestions; but what most struck us in the discussion was, that for the "new education" he provides no adequate basis. He says that all but one of the scientific and technological schools require no preparation in Latin for admission, "and in none of them are the classics taught." But, instead of accepting this position as an abandonment of the regular study of Latin by the "new education," he maintains that it should be merely put back to the preparatory period, contending that until seventeen all should be educated together.

This defence of the early study of Latin is a step backward, for the most enlightened educators of the present time advocate its postponement to the years of mental maturity; and this is all the more necessary when we consider the grounds on which the writer places its claims. Latin is to be acquired, not because of its value as an introduction to the language of science—this is vehemently repudiated—but because of the wealth and perfection of the literature it contains. That is, a boy who proposes to study the practical sciences, in addition to his thorough study of English (which the writer insists on), and various other preliminary studies, is to carry the acquisition of Latin to such perfection that the mind can move in it with full freedom, so as to enjoy the great masterpieces of its literature.

Now, it is testified to with emphasis by the best observers,

that even of those who give themselves entirely to the classical course, in the college as well as the academy, not one in ten arrives at this result. How absurd, then, to suppose that it can be attained by students at seventeen! We refer those, who wish to see this point ably handled, to the argument on "Early Mental Training," by Dr. Barnard, of Columbia College.

Nothing is more notorious, than that the attempt to teach the dead languages to boys generally results in such a disgust with the whole subject, that they do not pursue them when college discipline ceases; and hundreds of the most eminent men who had kept up their scholarly acquisitions attest that they were never able to get over the prejudices and painful associations of early classical study. This consideration evidently does not affect the writer in the *Atlantic*; though, strangely enough, he raises an objection to the early study of science on this very ground. He objects to the study of elementary science in early life, because "we have seen many cases in which too early dabbling with the physical sciences proved a positive injury in later years." But, what is still more extraordinary, while rejecting science itself, he would still teach children the logic of science. He says: "One cannot too early teach a child the distinction between a fact and an inference from a fact." Although confessing that this distinction is but rarely grasped by the mature mind—saying that "few adults appreciate this fundamental difference in its full strength"—yet he thinks we cannot too early teach a child these abstract relations of mental philosophy. Did it never occur to him what the effect of this kind of "dabbling" might be upon the pupil's subsequent mental experience?

The writer of these articles seems quite to overlook the order of mental unfolding by which the training of the perceptive faculties should precede and prepare for the higher action of the reflective powers. This, indeed, must be the corner-stone of the edifice of "the new education." It must begin with the observation of the properties and relations of concrete objects which science deals with and Latin does not; and, as the mental faculties of the child gradually strengthen, and it begins to get intelligible command of abstract relations, the skilful teacher will draw attention to the mental operations by which facts and inferences are discriminated.

## WHAT WE MEAN BY SCIENCE.

IN the plan of this JOURNAL, scientific subjects are to have a prominent share of attention; and as there is not a little confusion in the popular mind as to the ideas conveyed by the term "Science," it is desirable to get a definite understanding of it. At all events, it is necessary to indicate as clearly as possible the signification which will be attached to the word in these pages.

In its prevailing use, the term science suggests a special kind of knowledge which is different from common knowledge, and pertains to a particular class of subjects which are looked upon as foreign to the interests of common life. It is generally regarded as relating to external or physical objects, and calls up ideas of minerals, insects, drug-shops, or electrical exhibitions, with a copious literature of forbidding terms. In conformity with this notion, the science department of popular journalism usually consists of a mass of items thrust into an obscure place, where we are briefly informed of the discovery of a new mineral or asteroid, a novel chemical process, a hitherto undescribed zoophyte, or the latest inventive exploit in the way of churns. Science has its periodicals professedly and properly devoted to the technical details and results of research. These are minced and sorted, and then reproduced for the edification of the public. This information is no doubt useful; but, to offer it as affording any just idea of science, is little better than a caricature. The time has come when this noble term should be redeemed from these degrading associations, and made to stand for the larger and higher things which it now truly rep-

resents. Science is not the peculiar property of a few curious persons, who spend their days in watching bugs, or their nights in watching the stars. It is something, on the contrary, which belongs to the mind itself; which pertains to our very modes of thinking, and therefore concerns everybody. It is something to be used in reading, conversation, and business, at home and in the street, week-days and Sundays, in school, at the lecture, and the political gathering. Let us see how this is.

The literal meaning of the term science is to *know*. But it has been found that there are two kinds of knowing; we may know a subject loosely and vaguely, or with clearness and precision. So important has this distinction now become, that it is necessary to mark it in language, and so the word science has come to be applied to one of those kinds of knowledge; it means to know *accurately*. In the course of time and experience, knowledge slowly passes from the indefinite to the definite, from the vague to the precise. This change is of the nature of a growth, and hence, in its *quality*, science may be defined as the higher or more perfect stage of developing knowledge.

For example, men, in the rudest ages, observed that the days were longer in summer than in winter, and that there was a constancy in the relative position and a regularity in the movements of the stars: this was the dim beginning of a knowledge which has grown at length into the splendid science of astronomy. So it was known to everybody that fuel disappears in combustion, and that stones are altered by fire; and these vague notions have been, in time, unfolded into the science of chemistry. In like manner, it was understood, even in periods of earliest barbarism, that with scarcity the price of food rises; and that bits of metal may be made serviceable to carry on exchanges: these were the germs which have grown into a body of definite and connected truths, which form the science of political economy. Again, at the earliest dawn of intelligence, men knew that objects seen together are apt to be remembered together: this rudimental fact has been expanded in modern times into the science of psychology.

Such being the essential character of science, the question next arises, how much does the term comprehend? Our knowledge of Nature is *all* of this growing or progressive kind. In every aspect of the natural world the explanations were at first crude and imperfect, and have gradually ripened into greater distinctness and precision. We are thus brought to the full breadth of meaning of the term science, which is nothing less than the latest and truest interpretation of the order of the world at which the human mind has arrived. It is the perfected mode of thinking in its application to all the phenomena of Nature which can become the subjects of thought.

But, it will be asked, What do you mean by Nature? We mean the whole system of appearances—objects and actions—by which we are surrounded in the present state of being. It includes the entire realm of existence and activity, material and mental, with all their interconnections and interactions, which constitute the environment of man. As the material world is but a part of the natural order, physical knowledge is but a part of science. Our knowledge of mind and character, of the springs and limits of human action, of the relations of men and the conditions of social welfare, may be either loose and confused, or definite and accurate. This kind of knowledge conforms equally to the conditions of growth, and, therefore, has its true scientific aspects. But we can only comprehend the present attitude of the subject by referring to the relations which subsist among the various departments of thought.

The purely physical sciences, corresponding to the material phases of Nature, are the simplest, and have been developed first. By studying the internal or atomic changes of matter, the science of chemistry has been arrived at. Inquiries concerning the air have led to meteorology, and investigations into

the earth's crust have given rise to geology. But the intellectual movement thus exemplified is far from stopping with an exploration of material phenomena. Success here but sharpens the mind for the further research of truth. These departments of physical study have their highest value as a preparation for something beyond. They are but the training-ground of the human intellect for larger spheres of inquiry. The development of the physical sciences has produced grand and beneficent results, as all men know. But the advance of industrial civilization, to which they have led, is far from being their most important effect. Nor is their disclosure of the order of material Nature, by which man has been translated from the darkness of ignorance and superstition into the light and hope of knowledge, by any means their strongest claim to honor. It is in that higher education, and nobler discipline of the human mind, which can alone qualify it to enter upon the more exalted questions of the real nature of man himself, and his true relations to the surrounding world, and to his fellow-men; it is here that the nobler function of the physical sciences is to be sought.

That accuracy of thinking, which it is the business of science to enforce, has led to the detection of those uniformities in the course of Nature which we term *law*. More and more clearly is it perceived that all kinds of action exemplify cause and effect, and therefore conform to law; and more and more apparent is it also becoming that all measures of improvement, individual and social, must depend upon our understanding of the conditions and laws upon which all improvement depends. It is not enough that these conditions be vaguely apprehended; they must be vividly realized; and this vivid perception must be so deeply incorporated into the very habits of thought as spontaneously to rule the conduct. It is not sufficient to know, in a general way, that fresh air is salutary, and foul air injurious; the appreciation of the effects must be so clear and intense as to control action like an instinct. To bring about this state of mind, slowly, of course, in the mass of the people, is the duty and destiny of science. Its supreme educational office is to teach men to think more carefully and closely upon whatever subject they are required to think. Its larger use is to habituate them to guard against the disturbing influence of the feelings and the warpings of prejudice, to look beyond the immediate and to forecast distant consequences, to weigh evidence and avoid those errors of judgment which lead to rash and mistaken practice.

Imperfect knowledge is misleading; the more accurate it is, the better it serves for guidance. But this is no more true in navigation or mining, than it is in commercial business or in teaching. The subjects, however, are in some cases simpler than in others, and the simpler must obviously serve as stepping-stones to the more complex. It is not that knowledge is to be carried over from one field to another, but the mental training acquired in one field is to be employed in another. Granted that eminent skill in mathematics will not be a suitable preparation for a judge, or expertness in chemistry qualify for the intelligent management of a prison; granted that the knowledge conferred by scientific studies, as at present arranged, is not that demanded in dealing with the practical questions of every-day life; the fact, nevertheless, remains, that the cultivation of scientific, that is, accurate habits of thought, is the best preparation for action in all circumstances of responsibility.

#### ADULTERATION AND ITS REMEDIES.

THE *New York World* has recently done an important public service by appointing itself a commission to inquire into the state of food, drink, and drugs consumed by the inhabitants of this city. This idea of not waiting for the action of government, when a needed public work is to be done, but of nomi-

nating and electing one's self to the office of attending to it, strikes us as admirable and worthy of imitation. The *World* has summoned Science to make an inquest, with test-tube and microscope, into the honesty of New-York grocerymen. We are glad to note this emphatic recognition of the fact that science has intimate relations with morality. The subject being thus handed over to it for investigation, the report comes back that the morals of metropolitan commerce are not of the purest character. It is found that the whole community is enmeshed in a system of trading impostures, both quantitative and qualitative, in regard to the food it eats, the beverages it drinks, the medicines it takes, the kerosene it burns, and the air it breathes; and, if the investigation had been pushed a little further, it might have been added that the clothes it wears, the beds it lies upon, the gas it lights, the jewelry it sports, the cosmetics it delights in, and even the paper it reads, each has its element of cheating and imposition.

This disclosure is important, because, if we are actually investing our bodies with textile lies, weaving lies into our living tissues, and trying to correct abnormal functions with remedial lies, let us by all means be frequently reminded of it. These things have been long practised, and it has long been known that they were practised. The manuals of chemical examinations, microscopic guides, pamphlets for detection, magazine articles of exposure, wailing essays, and editorial warnings, have accumulated into a regular literature of the subject. In accordance with that rhythm of movement which we observe in the mental as well as in the material world, after an interval of obliviousness, the matter breaks out in the shape of a public spasm; there is an earthquake among the grocers, and execration abounds for a season, but, the excitement being discharged, all thing soon lapse into their old quietude.

Yet something is gained with every new convulsion. Accumulated experiences in time modify both feeling and thought, and work out new states of mind, which lead to new resources of defence against the evils of life. To be barely conscious of the existence of an evil, by no means puts us in the attitude to grapple with and destroy it. We must experiment with it, and reach right action through a course of failing trials. What, then, is to be done about these mischiefs of adulteration; for, making every allowance for exaggeration, there is a great deal of truth in the exposures? There are four modes of dealing with it.

The first is the denunciatory. It reprobates the wrongs, and anathematizes the guilty. The watch-towers of morality stand thickly in our midst, and every seventh day the people gather to listen to directions for "the right ruling of conduct." The displeasure of Heaven with immoral actions is emphatically declared, and divine vengeance upon those who commit them threatened. All are searched out, and found wanting somewhere. The auditors then return home to lunch upon adulterated bread, contaminated condiments, falsified coffee, and sophisticated wine. Something is, no doubt, effected by this mode of treating evil conduct, but, under any amount of denunciation, the rascally grocer flourishes. Mischiefs of this kind are not to be dismissed from society by a wave of the hand, or driven out by rhetorical onslaughts.

Then there is the legal remedy. We are bid to tighten up the laws and pile up the penalties. But the efficiency of law is not in the ratio of its stringency; with a disproportion between offence and penalty, legislation becomes self-defeating. Besides, the very pettiness of the transgressions, in this case, makes punishment difficult. Law, also, has done some service in this matter, but the abuses have grown in spite of it.

A third method is, that private enterprise shall take up the matter and deter dealers from fraudulent practices by the danger of exposure. This is theoretically right, but practically insufficient, as private enterprise is a somewhat intermittent agency. The field has been long and temptingly open to it, but it has hitherto done little more than keep us advised, from time to time, of the extent of the mischief.

We now propose a fourth method of relief, which, while it is neither so short nor so sharp as the foregoing, is the only one adequate to meet the case. It is simply that the people interested in these proceedings shall be instructed to take care of their own interests. Where do these omnipresent malpractices have their roots? In public ignorance, and its consequent indifference. The people know very little about these things, and therefore care but little. They breathe poisoned air when they can get pure air at the same price; how, then, can they be expected to distress themselves about the concealed impurities in their food and drink? It is this ignorance and carelessness which makes them the victims of sharpers, and which makes the sharpers possible. While the dupes remain, it is of small use to root out the quacks; their places would be quickly supplied with new ones.

We charge these evils of adulteration to public ignorance, but we do not mean by this the mental vacuity or stupidity of the refuse of society; we mean that lack of general intelligence concerning common things which prevails in all ranks, and may be as noticeably exemplified in the college graduate as the illiterate blockhead who cannot read. We boast of our education, and the city abounds in public schools, seminaries, and colleges. These institutions impart much valuable information, but they are deplorably deficient in that which is most important. The pupils parse and declaim; they dig among the roots of algebra, and roam through geography and history; they learn all kinds of things, except those which involve their very life-needs. We say, then, direct the instruction in the New-York schools, and of the public schools throughout the country, to its proper end—"the preparation for right living." So long as we have not begun to teach the things in which life and death are involved—so long as the community is swindled and poisoned in its daily means of maintaining existence, and is not only ignorant of all means of defence, but of the very fact of the imposition, let us remit somewhat of our boasting, and talk in modest undertones about our "universal education."

The plan of relief we now propose is not to be objected to as impracticable. Every public school in the city ought to have a laboratory, and every boy or girl, fifteen years of age, should be instructed in elementary chemical testing and the use of the common microscope. This is entirely feasible: no more mental capacity is required to make a rough analysis of a sample of saleratus than to make an analysis of a sentence, or to work out a problem in fractions. This practice, moreover, would train the observing powers—a most important part of education, and one for which there is at present no adequate school provision. This is the true point of attack upon the system of commercial imposture from which we suffer. Let it once be understood that even half a dozen of the leading public schools are prepared to make this subject a regular study; let competent instructors be provided (and one such might officiate at several places), and let samples of the common articles of domestic consumption be made regular object-lessons of careful examination, and not only would the mental cultivation thus afforded be of itself valuable, but it could not fail to exert a powerful influence in repressing fraudulent practices. Definitely established, and with the sympathy of the community, it would act as a permanent commission of inquiry, and might be made to operate with energy and efficiency. Moreover, as the pupils went out into life armed with this knowledge, families would begin to have their defence, and a habit of searching into these matters would gradually arise among the people. Such an example would also be imitated by other schools throughout the country.

The impulses of scientific inquiry in past times have largely originated in the various exigencies of society, which required to be met and relieved; when education begins to respond to these requirements, and to prepare the young for the practical and urgent work of life, the most salutary results will assuredly be realized.

## TABLE-TALK.

NOTHING can be more stirring, more vivid, or more brilliant, than the appearance of the grand drive at the Central Park, on a fair day, in the fashionable season. In the cartoon which accompanies this number of the JOURNAL, the artist has in no wise exaggerated the picture. The scene selected for the drawing is the circle which describes a small lake in the upper part of the Park, just where many carriages sweep around to return southward toward the city, and others detour into the wide avenues beyond the Park, where it is customary for the owners of fast horses to show the mettle of their steeds.

Probably nothing more fully exhibits the wealth, luxury, and taste of New-York City than its fancy "turnouts" and private carriages. These brilliant equipages are comparatively a new feature in our metropolitan extravagance. Our old families, it is true, kept their carriages; but they were almost solely used for ceremonious purposes; and it was not until the rapidly-increasing wealth of the city, added to the charms of our unsurpassed Central-Park drives, that a passion for fast horses and costly carriages existed more than in a few exceptional instances. One of our carriage-manufacturers marks the approach of this state of things by saying that, in the year 1839, the demand for costly equipages was nominal. In the succeeding ten years he manufactured one hundred a year; in the next ten years two hundred and fifty a year; and in the next ten years—from 1859 to 1869—an average of five hundred a year, making an aggregate, all the manufactures of the city included, of at least fifty new carriages a day. The fashionable styles are: the Clarence (large family or state carriage); landau (opening on the top); landulet (opening on the top, with appliances to remove the front section if desired); coupé (for fair weather or fresh air); pony-phæton (riding *al fresco*); and a four-in-hand drag, which, within a few years, has become one of the most conspicuous features of the Central-Park drives.

The pictorial art of the stage now more than rivals the actor, and almost supplants the poetry of the dramatist. It has thrust itself into a first place in theatrical affairs, and not even Shakespeare himself is now acceptable to the public unless set forth with a wealth of scenic display. It has its meretricious aspects, undoubted; but it is by no means always mere show and glitter. It has often great pomp of color; it is sometimes intensely vulgar; it is frequently an appeal to barbaric taste; and in dramas of a certain character it aims, not only to be dazzling, but sensuous. In these it designs to heat the blood, and fill the imagination with voluptuous images. Female beauty is more or less identified and mingled with it. It exhibits paradises of intoxicating beauty, and places the houries there before our eyes. It is the Mohammedism of art.

But it is not always this. It sometimes affords us pictures of exquisite and elevating beauty. It often reproduces the periods of the past with fidelity and historic splendor. It can be, and occasionally is, all that art in any form can aspire to—the means of refined pleasure and elevating sentiment.

Art upon the stage not only reaches larger numbers than is possible otherwise, but its effects are broader, its illusions more perfect, its impressions more stimulating, and its lessons more decided. It is far more real. It is capable of grander and sublimer effects. It is more satisfying to the imagination. It is more nearly the thing depicted. We speak, of course, of this art in its better and more successful expression. We mean such pictures as were exhibited last year in "Midsummer Night's Dream" at the Olympic; in a recent scene called the "Lilacs" at Niblos; in a few scenes in the French opera; and in several scenes now presented at Wallack's Theatre, in "Much Ado about Nothing," and at Booth's new beautiful dramatic temple, in "Romeo and Juliet." These are all artistically beautiful,

and prove that, while scene-painting has often been low, coarse, false, and hurtful, it is capable of being employed in a higher and purer spirit. In these instances quoted, the stage scenes have nearly the same effect upon the imagination, only more vivid, that a landscape by one of our painters has. Not so completely refining, of course; not so pure in taste; not so simple, symmetrical, and chaste; with more or less thought, no doubt, to dazzle the unthinking—and yet with a largeness, a triumph of perspective, a completeness in proportion and fullness, that render them the most powerful form of pictorial expression.

It is curious to note that, while the Positive Philosophy, so called, of M. Auguste Comte, seems to be growing in favor with certain semi-scientific or socialistic persons, it is fast losing its hold upon the well-trained scientific mind of the age. There is a tendency to accept the term "positive" as well applying to that body of definite scientific truth which is capable of verification and of universal acceptance; and there is an equally marked tendency to reject Comte's distinctive system of doctrines. The last decisive repudiation of Comte is by Prof. T. H. Huxley in a recent able lecture on the "Physical Basis of Life." Referring to a previous lecture of the Archbishop of York, he observed: "Now, so far as I am concerned, the most reverend prelate might dialectically hew M. Comte to pieces as a modern Agag, and I should not attempt to stay his hand. In so far as my study of what specially characterizes the 'Positive Philosophy' has led me, I find therein little or nothing of any scientific value, and a great deal which is as thoroughly antagonistic to the very essence of science as any thing in ultramontane Catholicism. In fact, M. Comte's philosophy in practice might be compendiously described as Catholicism minus Christianity."

The proposition that there is no such thing as technical English grammar, though not originating with Mr. Richard Grant White, has found in him one of its warmest supporters. In a recent number of *The Galaxy* he gives plausible reasons for his position; and, though some scholars may think that he has strained a point here and there—as, for instance, when he asserts that, in the sentences, *I have loved* and *I have money*, the powers of *have* are precisely equivalent—few will be disposed seriously to contest his broad conclusion that, the English language possessing very few inflections, most of its written grammar is "so-called," or, as he terms it, *make-believe* grammar. But, from this conclusion, some practical inferences have been drawn or assumed by others, against which we cannot too strongly protest. Thus, it is urged, that absence of style necessarily follows absence of technical grammar, that there is and ought to be no such thing as style in English, and that it is no matter how a man expresses his ideas, provided he does so intelligibly. Surely the logical and natural conclusion is just the opposite. If the relations of English words to one another depend entirely, or almost entirely, on their position in a sentence, then indeed their arrangement is of great importance; and arrangement is a leading element of style.

Another question deeply affects the rising generation. If most of our English grammar is *make-believe*, the study of it should be suppressed, like all other shams. On the other hand, it is certain that any liberal education involves a very appreciable amount of verbal and grammatical study of some sort. The abolition of English grammar implies, therefore, one of two things: either the preservation of the much-assailed classics, or additional attention to the modern languages in their written form.

It may be questioned whether published literature is, after all, a full or just measurement of public taste and intelligence. No doubt there are twenty books written to where one is printed; and editors of periodicals will bear witness that, of

all the lucubrations offered to them for publication, a smaller proportion even than this finds its way into their pages. Clearly, then, our published literature exhibits an exceptional culture. That which goes into the waste-basket more nearly indicates our average taste and capacity. Bad as that which is printed may be, yet it has been culled and gleaned; there is behind it a vast residuum which is inferior to it. Only editors and publishers know how poor this remainder is; how capricious the taste, how strange the ignorance, how low the morals, how rambling the logic, which a very large number of ladies and gentlemen display, to the fortunate ignorance of their friends and the public.

Everybody has heard of the gigantic and extraordinary animals of the ancient world, which inhabited the earth long before the introduction of man. Their tombs are the geological formations, and fragments of their skeletons having been exhumed and pieced out by the anatomists, their colossal frameworks are set up in the museums, and engravings of them fill the geological books. To the student of these things, who discovers the vestiges in the rocks, chisels them out, and supplements the deficient parts, nothing can be more real than these extraordinary creatures and the circumstances of their lives; but to those who give little thought to the subject they are regarded, with a kind of incredulous wonder, as myths of the scientific imagination. Nothing is so well fitted to dispel this state of mind as the restoration of those extinct forms in their full dimensions and lifelike aspects; not with the flesh off, and standing in their bones, as Sydney Smith wished to do on a hot day, but filled out in due proportions, so as to simulate the reality of nature. Some of the largest and most remarkable of the American fossils are to be thus restored at the Central Park, the Commissioners having engaged Mr. Waterhouse Hawkins to do the work. This is an important step in the direction of public education, as there is no place on this whole continent where these objects would be seen by such multitudes of people, and seen under such favorable circumstances of leisure for observation as those afforded by the Central Park of New York.

The dinner of the Yale Alumni Association, at Delmonico's, last month, was one of the most successful public banquets of the season. Mr. Evarts, always happy, showed his very happiest vein; President Woolsey was as grandly ingenuous as Admiral Farragut could have been; and the graduates generally had what old Theocritus would have called a jolly revel. It is worth noting, however, that while alumni associations are becoming popular, there is no tendency to any thing like *inter-collegiate* action. The attempt to establish a university club a few years ago proved a total failure. The Harvard men especially pooh-poohed the movement from the first. Now the alumni clubs furnish opportunities for pleasant social gatherings, and confer more solid advantages on their respective colleges by encouraging benefactions and bringing graduate opinion to bear on academic management; but the *united* cultivation of the country might do much more than this. President Woolsey told the Yalensians that the union of educated men of all conditions was the only true democracy; he might have added, that it was also the only true aristocracy. And, when we consider how great a cause and promoter of evil ignorance has always been, the formation of such an aristo-democracy is surely desirable.

### Literary Notes.

THE inquiry is frequently made, if Mr. Herbert Spencer is going forward with his new "System of Philosophy," and why we hear nothing about it in the English periodicals. He is proceeding with it regularly, and the last instalment—the "Data of Psychology"—will be given to the American public in a few days. The reason why nothing has been said by the English reviews is, that the works are not furnished them for notice. So gross were the misrepresentations of his

views, that he gave orders to his publisher to send no more copies of his books to the press. His philosophy is, however, being carefully studied by the leading thinkers of England, and is being reproduced upon the Continent. His works, curiously enough, were first undertaken in Russia, where they have nearly all appeared. The censor of the public press required that "First Principles" should be accompanied by a refutation. Accordingly, M. Thieblin, the translator, prefixed to it a learned essay, in which all its facts and generalizations were confounded by a formidable parade of quotations from the fathers. He closed the essay with the significant observation, "that if the refutation was not complete, it was not from lack of zeal to make it so, but from lack of knowledge!" The performance was satisfactory. Mr. Spencer's writings are now being translated into the French by three different professors of Philosophy, Doctor Cazelles, M. Ribot of the *Lycée Impérial*, Laval, and M. Rethoré, Professors of Philosophy in the *Lycée Impérial*, Angoulême.

The "Life and Letters of Fitz-Greene Halleck," just published by Appleton & Co., contains many interesting reminiscences of early New York. Halleck's associates and friends included a host of giants. There were Irving, Cooper, Paulding, Bryant, Kent, Drake, Hoffman, Pierpont, Poe, Fay, Dr. Francis, Morris, Verplanck, Duer, Charles King, Longfellow, Hawthorne, and all the later literary celebrities. In addition to these, Halleck was intimate with the artists Inman and Elliott, with the actors Kean, Macready, Placide, Burton, Brougham, Charles Matthews, Miss Cushman, Ellen Tree, Wallack, the elder Booth, and Mitchell. He knew Lord Morpeth, Lord Stanley, Miss Mitford, Miss Martineau, Thackeray, Dickens, and, indeed, almost everybody of his time who is known and famous. When Louis Napoleon, then "Prince Louis Napoleon," was in New York, Halleck knew him well. The prince and the poet exchanged dinners, but Halleck never afterward obtruded upon the *Emperor* his recollections of the *Prince*—whom, indeed, he thought a dull fellow. As a youth, Halleck was noticeable for his studious and retired habits. He had no taste for rough sports and adventures, preferring solitude and a book to almost any other enjoyment. Although he wrote much in his juvenile days, his first published poem did not appear until 1813. It consisted of a few verses on the "Star of Peace," but he never included it in his collections. In this year he first met Rodman Drake, when began a friendship between the two poets that lasted until Drake's death. All the world is familiar with those elegiac verses to Drake's memory, beginning with, "Green be the turf above thee." When these were first printed, some of the journals in copying them substituted "sod" for "turf," and others "grass." "I think," said Halleck, "they will get it yet, 'Green be the *peat* above thee!'" Halleck was a good talker, but he could not make a set speech. Once, at a complimentary dinner given to him, he begged permission to respond sitting to the toast in his honor, because when he stood up all his "brains ran to his heels." He was like Irving in this particular. But he was a good talker, as we have already said, and he would relate with glee a delightful two hours' conversation he had once held with Hawthorne, in which the great romancist never opened his mouth. A singular fact is connected with the publication of "Marco Bozzaris." Although the popularity of this poem was immense, not only in America but in Europe—although it was quoted, declaimed, imitated, discussed, translated into French and modern Greek, the poet's own family remained for over five years in ignorance of its existence. A poet's own family, it seems, may be the last to know of his genius or his fame.

The London *Saturday Review*, notorious for its sharp criticisms, and its disposition to find fault, is pleased to say of the "American Annual Cyclopædia for 1867," published by D. Appleton & Co., that it "is the most complete and convenient work of reference for recent history, for the political events of the last few years, for the various features of social, commercial, industrial, and scientific progress, that has yet come under our notice, or, we believe, that has been published. It is impossible that a scheme so wide and so ambitious, embracing nearly every subject of human interest, should be executed in a manner fully worthy of the conception—that there should not be many omissions, many errors, many blemishes, due to haste, to carelessness, to prejudice, to ignorance, and to the simple impossibility of finding men with the qualifications and the leisure required to keep up with the times in each separate department of human knowledge. Were it otherwise, the work would be invaluable; as it is, its value is not easily estimated."

"Underground Life; or Mines and Miners," recently published in England, from the French of L. Simonin, is not only the most valuable and exhaustive work on the subject of mining, but it is also the most truly elegant and sumptuous. It contains one hundred and sixty illustrations, engraved on wood, twenty maps, geologically colored, and ten plates of metals and minerals, in chromo-lithography. The latter are surprising exhibitions of artistic skill. They were executed in Paris, by Regamey, and reproduce the colors and texture of the crystals with marvellous fidelity. The contents include not only a scientific history and description of minerals, but a graphic account of various forms of mining.

A Heine revival is taking place just now in the best literary circles of Paris. Henry Heine, the great German poet, who spent the last thirty years of his life in Paris, was so much neglected there during the latter part of his literary career that, when Hector Berlioz one day called upon him, he exclaimed, "Yes, Berlioz has always been an eccentric fellow. He pays me a visit!" Just now new translations are issued of Heine's works, and the *causeries* in the feuilletons are full of Heine's droll witticisms.

Mr. W. E. H. Lecky, author of the "History of Rationalism in Europe," has now ready for the press, and will shortly publish, a work upon the History of Morals in Europe. Every admirer of that recent inquisitive literature, adorned by the names of Buckle, Spencer, and Lecky, will welcome a work upon a subject which opens so wide a field for philosophic thought and investigation.

Krylow, the Russian fable-writer, received perhaps the largest copyrights of any modern author; the Moscow and St. Petersburg booksellers paid him, during the last fifteen years of his life, the enormous sum of three hundred and fifty thousand rubles for the copyright of his two thin volumes of fables, most of which are imitations of *Æsop*, *Phædrus*, and *Lafontaine*.

Hans Christian Andersen is not only the most brilliant and gifted, but also the most modest and kind-hearted of story-tellers. Here is what he wrote recently about the fairy tales of his Norwegian rival Bjornson: "These fairy-tales, I honestly believe, are the best which have appeared in Europe for many years past."

The rivalry between the German publishers of Goethe's and Schiller's works has now reached such a point, that Cotta, the great Stuttgart bookseller, offers his superb edition of Goethe's complete works, in six large royal 8vo volumes, with all the steel engravings by William Kaulbach, for three dollars.

Berthold Auerbach is at work upon an historical novel, the scene of which will be laid in the old Bohemian city of Eger. The manuscript will be presented to the Jews of Eger, who will publish fifty thousand copies of the work, and use the profits in building a new synagogue.

The manuscript of the second volume of Mme. Victor Hugo's work on the life of her husband, the first volume of which was issued in 1863, will not be allowed to be published until after M. Hugo's death.

The Paris edition of Victor Hugo's new novel will be printed by an old schoolmate of the great poet and romancier.

## Matters of Science and Art.

OUR painters, unlike the famous Macedonian, seem to have little disposition to seek new worlds for conquest. While they repeat year after year pictures of the Catskills, the White Mountains, and the Adirondacks; while Lake George has scarcely a rock or tree unpainted; and the Berkshire Hills are as familiar to frequenters of galleries as Trinity Church to the bulls and bears of Wall Street; while, in brief, all the aspects of our Northern scenery are like thrice-told tales, a splendid range of mountain scenery remains nearly unconscious of the painter's canvas. Occasionally only do we meet with a picture of the Alleghenies, while the Blue Ridge of Virginia and the mountain scenery of North Carolina seem never to have been visited by our painters. We have some acquaintance with Virginia mountain scenery, by means of Mr. Strother's "Virginia Illustrated," and in Lanman's "Alleghany Mountains" there are descriptions of scenery that, if known to our painters and tourists, would surely fire their hearts, and fill, by another season, all the gorges and heights of that region with enthusiastic searchers for the picturesque. In the supposition that Lanman's descriptions are not generally familiar to our readers, we will quote a few sentences in support of what we have said. Describing what is called "Hickory-nut Gap," he says: "From any point of view this particular spot is remarkably imposing, the gap not being more than half a mile wide, though appearing to narrow down to a few hundred yards. The highest bluff is on the south side, and, though rising to the height of full twenty-five hundred feet, it is nearly perpendicular, and, midway up its front, stands an isolated rock, looming against the sky, of a circular form, and resembling the turret of a stupendous castle. Over one portion of this superb cliff, falling far down into some undiscovered and apparently unattainable pool, is a stream of water, which seems to be the offspring of the clouds." Lanman also describes two mountain views that are assuredly worthy of Durand or Gifford: "The first was a northern view of Black Mountain from the margin of the South Poe River. All its cliffs, defiles, ravines, and peaks, seemed as light, dream-like, and airy, as the clear-blue world in which they floated. . . . The other prospect was from the summit of the Blue Ridge, looking in the direction of the Catawba. It was a wilderness of mountains, whose foundations could not be fathomed by the eye; while in the distance,

towering above all the peaks, rose the singular and fantastic form of the Table Mountain." There are other views among these mountains glowingly described, and a word-picture of Lindville Falls that is full of interest. The most noticeable features of the falls are "a number of lofty and exceedingly fantastic cliffs peering over each other's shoulders into the depths below," and an isolated column "several hundred feet high, around which are clustered, in the greatest profusion, the most beautiful of vines and flowers." It is clear that our painters err in travelling so much over beaten ground. All through the Southern country lies ready for them a virgin field.

The multiplication of poor copies of inferior pictures by means of chromo-lithography would be more earnestly a subject of regret, if the passion for this sort of art was not sure very soon to follow the way of all fashions, and burn itself out by excess. The argument that chromo-lithography is the means of bringing pictures into every poor man's parlor, and that it serves, by instructing and preparing the public mind, as a pioneer to a higher art, is scarcely tenable. People are not likely to be educated in color by showy and vulgar examples. Moreover, these highly-colored, would-be paintings are really the means of injuring steel-engraving, which is a far purer and more instructive branch of art. And now this is particularly to be deprecated, when, by a recent invention, engravings on metal may be electrotyped, and, by this means, the easier art of engraving on copper restored. Copper-engraving was forced out because the metal was so soft that but few impressions from the plate could be taken, and the harder steel surface was introduced instead. The enormous labor and cost of pure line on steel soon became the means of introducing the cheaper methods of stipple and mezzotint, which are now used more or less on almost every plate. But this invention of electrotyping, whereby an engraving on copper may be reproduced on steel, is likely soon to be the means of restoring copper-engraving, and with it pure line; and if a corrupt popular taste is the means of delaying this consummation, there is certainly cause for regret. As to prints in colors, no doubt the eye will always crave them. But, in order that they may satisfy a refined taste, a decided improvement is needed, and this can be secured solely by the plan pursued in former years for the well-known Bagster prints, in which steel, stone, and wood, were all employed in order to obtain the requisite delicacy in some parts, and fulness of tone with proper texture in others.

The forces of civilization are urging communities to undertake bolder and more startling enterprises of improvement than any hitherto accomplished. It is in contemplation to drive a tunnel under the Straits of Dover, twenty-four miles, to connect the British and Continental railways. The chalk-beds which underlie the Channel are favorable for the work. For the securing of efficient ventilation, both during the construction and after the completion, instead of the towers in the sea, which were at first suggested, it is proposed to sink pits on each shore, and to drive thence, in the first place, two small parallel drift-ways or galleries from each country, connected at intervals by transverse drift-ways. By this means, aided by furnace-rarefaction and revolving air-fans, the air is to be made to circulate as in ordinary coal-mines, and the problem it presents is held to be less difficult than the ventilation problems in mining engineering. The formation of these double drift-ways is the preliminary part of the undertaking, as they are to be used as helps in carrying out the construction of the permanent tunnel. Should it be impossible to execute these, the expense of entering upon the main work, and the loss consequent upon abandoning it, would be avoided. The cost of the galleries is estimated at from eight to ten millions of dollars, and of the regular tunnel about five times that amount. Three English and three French engineers are preparing to report upon the scheme to a committee, which will soon meet in Paris.

Some interesting facts have been lately ascertained respecting the conditions of life at the bottom of the sea. Professor Edward Forbes, who has paid the greatest attention to the distribution of marine animals, speaks of "an abyss where life is either extinguished or exhibits but a few sparks to mark its lingering presence. Its confines are yet undetermined, and it is, in its exploration, that the finest field for marine discovery yet remains." Something has been contributed toward the discovery thus foreshadowed by Dr. Carpenter and Professor Wyville Thompson, who have recently been engaged in deep-sea dredging in the bed of the North Atlantic, having been furnished with a ship for the purpose by the English Government. They reached greater depths than had ever before been attained, bringing up mud by the hundred weight from the ocean-bed, 3,900 feet below the surface.

It had been generally supposed that animal life ceases at a depth of about 1,800 feet, but many varieties of it have now been shown to dwell at depths far lower, where the pressure of the superincumbent sea is more than 100 atmospheres. But the strangest result of this deep dredging has reference to the quality of the mud itself, which was brought up from the sea-bottom. It is described as a bluish-white, unctuous, or gelatinous substance, with indications of a protoplasmic or low organized constitution. By some it has been regarded as a gigantic pro-

tozoan, extending perhaps over miles of surface, and yet all one living mass. Professor Huxley has been engaged in studying this singular substance under the microscope, and has termed it *Bathybius*.

The absence of historical art in America is often noticed, and, no doubt, there exist good reasons for it. But both our sculptors and painters have utterly ignored one character in our imaginative literature, that not only seems completely consonant with the spirit of our woods, but with the history of America. We refer to young Uncas of Cooper's "Mohicans." This graceful and splendid savage is the type of the American past. He personates the history and spirit of the woods. We think of him as an aboriginal Apollo, or as an epic hero of the forests. He possesses every attribute of the typical hero—youth, beauty, grace, and "terrible daring." He is conspicuously the subject for the sculptor who would translate into stone the spirit of aboriginal life; he is equally the theme for the painter who would illustrate the link between Humanity and Nature—for what Undine in German tradition is to the waters, Uncas is to the woods. And what Apollo and Adonis are to Greek art, Uncas should be to American inspiration. There is nothing like him, indeed, outside of Greek imagination; and we may well wonder that he has never been accepted by art, either on account of his splendid personal qualities, or the typical character in which he may be viewed.

A movement was started in London, a year or two ago, to have a course of scientific lectures on Sunday evenings, to draw, if possible, from haunts of dissipation some of the multitudes who do not attend religious services. A number of men of high position, such as Lyell, Owen, Carpenter, and Huxley, were engaged to speak in the course, which had hardly got well under way, when it was closed by the Society for the Promotion of Sabbath Observance, under an antiquated statute against Sunday exhibitions. A portion of those in favor of the lectures propose to evade the law by ranking themselves as a sect under the title of *Recreative Religionists*. Others, among whom are Carpenter and Huxley, regard this as a mere petty subterfuge, and have denounced it as such in letters to the journals. If such meetings are unlawful, they say, they must be discontinued until the law is set aside. A brisk controversy is going on as to the tactics of "the body which promulgates the patent sham that it is a religious sect."

It is reported that an effort will soon be made to unite all the scientific bodies of London into one institution, under the title of the British Academy of Sciences; the Royal Society, however, is not to be included. Such a movement will hardly fail to result in advantages both to the societies themselves and to the general interests of scientific inquiry. The need for a better organization of those who devote themselves to investigation is becoming increasingly felt, and the recent movement in this city for the formation of a National Institute, is a further exemplification of it.

## The Museum.

A GOOD telescope, with a 8½-inch aperture, virtually brings the moon within 1,200 miles of the observer, or within one two-hundredth of its real distance. Lord Rosse's telescope brings it within 42 miles, so that objects 270 feet long are discernible. Baer has calculated that an instrument of ten times the power of Rosse's would be required to bring the moon within a German mile, at which distance the body of a man can be perceived.

Chemistry was for a long time occupied in analyzing substances, or taking them to pieces, and it was supposed that this was its chief business; but, latterly, it has turned round and taken to synthesis, or making new combinations, and the possibilities before it seem almost infinite. Berthelot, the eminent French organic chemist, makes a calculation of the number of combinations which may be made of acids with certain alcohols. He says if you give each compound thus possible a name, and allow a line for each name, and then print 100 lines on a page, and make volumes of 1,000 pages, and place a million volumes in a library, you would want 14,000 libraries to complete your catalogue.

The chemical power of the moon's light upon the photographic surface only surpasses that of Jupiter in the ratio of 6 to 5, and Jupiter's light has 12 times more chemical energy than Saturn's.

The evidence that the brain is the principal organ of the mind is five-fold: 1. The pain of excessive mental excitement is localized in the head. 2. Injury or disease of the brain affects the mental powers. 3. There is a general connection between size of brain and mental energy. 4. The products of nervous waste are more abundant after nervous excitement. 5. Specific experiments on the brain and nerves show that they are indispensable to the mental functions.—*Bain*.

According to Bence Jones's analysis, the relative strength or stimulating power of liquors is as follows: Ten glasses of cider or porter, six glasses of claret, five glasses of burgundy, four glasses of champagne,

three glasses of port or sherry, are equivalent to one glass of brandy or three-quarters of a glass of rum.

At Carisbrook Castle, in the Isle of Wight, is a well 210 feet deep and 12 wide. The interior is lined by smooth masonry, and, if a pin is dropped into it, the sound produced, when it strikes the water, is distinctly heard.

The effect of the solar radiations upon each cubic mile of the earth's atmosphere has been calculated, by Professor Wm. Thompson, to be equal to the mechanical effect of raising 12,050 pounds' weight one foot high each minute.

There is a striking analogy between the senses of hearing and sight. Both are excited by undulations or waves. Sounds of different pitch are produced by different rates of air-pulses, and lights of different colors by different rates of ethereal pulses. But the ranges of the two senses are very different in relation to their respective media. In its width of perception the ear comprehends no less than eleven octaves, while the luminous scale embraces but a single octave. The quickest vibrations which strike the eye as light are the blue rays at one end of the spectrum, and they have only about twice the rapidity of the red rays at the other end of the spectrum. But the quickest vibrations which strike the ear, as a musical sound, have more than two thousand times the rapidity of the slowest.—*Tyndall*.

Two ounces and a half of magnesium will, when burnt, give a light equal to twenty pounds' weight of stearine candles.

M. Kosman, of Strasburg, observed that both the leaves of plants and their corollas give out a ponderable quantity of ozonized oxygen—a much larger proportion than that which exists in the air, and that the quantity is less in the night.

If the solar system had a nebulous origin, and has been undergoing gradual condensation and concentration, the process must be regarded as very far advanced, for all the planets put together are but the 45th the mass of the sun.

The *Noctiluca*, the most beautiful of the marine infusoria, emits a brilliant electric light, which makes the sea shine like streams of silver in the wake of a ship, of a warm summer evening, when they come to the surface in countless multitudes. It is a globular animal, like a minute soap-bubble, and, being about the thirtieth of an inch in diameter, is a giant among the infusoria. Its electric light, supposed to be emitted by a direct exertion of the nerve-power, appears constant to the naked eye, but really consists of momentary scintillations, that increase in rapidity and intensity by the dash of an oar or the motion of the waves.—*Somerville*.

The lowest animal and the highest animal present no contrast more striking than that between the small self-mobility of the one and the great self-mobility of the other. A monad passing, apparently with some rapidity, across the field of the microscope, really advances with extreme slowness; its velocity, unexaggerated by combined lenses, being about that of the minute-hand of a watch. Comparing the movements of Protozoa with those of birds that keep pace with a railway-train, their locomotive powers seem scarcely appreciable. Masses being supposed equal, the quantity of motion generated in the last case approaches a million times that generated in the first.—*Herbert Spencer*.

An artesian well in Louisville, Kentucky, has a depth of 2,086 feet; one in St. Louis has a depth of 2,200 feet; while that at Columbus, Ohio, is 2,575 feet deep. The boring at Columbus indicates an increase of temperature of one degree Fah. for every 71 feet; that at Louisville gives an increase of one degree for every 76 feet.—*Loomis*.

No. 2.—WITH SUPPLEMENT.]

SATURDAY, APRIL 10, 1869.

[PRICE TEN CENTS.]

THE MAN WHO LAUGHS;  
OR,  
BY THE KING'S COMMAND.  
BY VICTOR HUGO.

PART I.—SEA AND NIGHT.

BOOK I.—NIGHT LESS DARK THAN MAN.

I. THE SOUTH POINT OF PORTLAND.

AN obstinate north wind blew without intermission over the continent of Europe, and with special violence over England, during all the month of December, 1689, and all the month of January, 1690. Hence the destructive cold which caused this winter to be noted as one "to be remembered by the poor," on the margins of the old Bible in the Non-Jurors' Chapel of London. Thanks to the useful solidity of the old royal parchment employed in the official registers, long lists of poor, found dead of hunger and want of clothing, may still be read to-day in many local repositories, particularly in the archives of Clink Liberty Court, in Southwark Borough, of the Pie-Powder (*pieds poudreux*, "dusty-foot") Court, and of Whitechapel Court, held at the village of Stepney by the seigniorial bailiff. The Thames was frozen over, which happens only once in a century, as ice forms on it with difficulty, owing to the agitation of the water. Carts rolled on the frozen river; there was a fair on the Thames, with bear-baitings and bull-baitings; an ox was roasted whole on the ice. This thick ice lasted two months. The doleful year 1690 surpassed in severity even the celebrated winters at the beginning of the seventeenth century, so minutely observed by Doctor Gideon Delaun, who was honored by the city of London with a bust on a bracket, in his quality of apothecary to King James I.

One evening, toward the close of one of the coldest days in this month of January, 1690, there was going on in one of the many inhospitable creeks of Portland Gulf something unusual, which caused the seamews and wild-geese to scream and circle around the entrance of the creek, afraid to reënter it.

In this creek, the most dangerous, during the prevalence of certain winds, of all those running in to the gulf, and consequently the least frequented, convenient, by reason of this very danger, for ships that seek concealment, a little vessel, almost touching the cliff, thanks to the depth of the water, was moored

to a point of rock. It is wrong to say *night-falls*; we ought to say *night-rises*, for darkness begins from the earth. It was already night at the bottom of the cliff; it was still day above. Had any one approached the moored vessel he would have recognized a Biscayan ork.

The sun, hidden all day by the mist, had just set. Men began to feel that dark and deep grief which may be called anxiety for the absent sun.

As the wind did not come from the sea, the water of the creek was calm.

It was a lucky exception, especially in winter. Nearly all these Portland creeks have bars. In bad weather there is a high sea on the bar, and much skill and practice are required to pass it safely. These little harbors, more apparent than real, perform their function badly. It is fearful to enter them and terrible to leave them. That evening, for a wonder, no danger.

The Biscayan ork is an old species of lighter, now gone out of fashion. These orks, which did good service, even in war-navies, were stout hulls, barks in size, ships in strength. There were orks in the Armada; true, the war-orks reached a heavy tonnage, thus the flag-ship *Grand Griffon*, commanded by Lope de Medina, was a vessel of six hundred and fifty tons, mounting forty cannon; but the merchant and smuggling ork was on a very small pattern. Seamen considered this kind of lighter a petty vessel. The cordage of the ork was made of hempen strands, some ropes having a heart of iron wire, which shows a probable, though unscientific, design of obtaining indications in case of magnetic tension. The delicacy of this rigging did not exclude large working cables, the *cabrias* of the Spanish galleys and the *cameli* of the Roman triremes. The tiller was very long, which construction has the advantage of great leverage, but the disadvantage of small play; two sheaves on sheave-holes at the end of the tiller corrected this defect, and somewhat made up for the loss of force. The compass was well housed in a binnacle perfectly square, and well balanced by its two copper frames placed one within the other horizontally on little pivots, just as in a Cardan lamp. There was knowledge and cleverness in the construction of the whole ork, but it was ignorant science and barbarous cleverness. The ork was as primitive as the Dutch praam and the Indian canoe, having the former's solidity and the latter's speed, and possessing, like all vessels born of the fishing and piratical instinct, wonderful sea-going qualities. It was equally good for close and open waters; the play of its sails, complicated with stays and very peculiar, allowed it to beat well in the enclosed bays of Asturia, which are almost basins, passages for instance, and to run with a free

\* Entered, according to Act of Congress, in the year 1869, by D. APPLETON & CO., in the Clerk's Office of the District Court of the United States for the Southern District of New York.

wind on the open sea; queer ships of all work were they, good for a stagnant pool, good for an ocean-storm. The ork was among ships what the water-wagtail is among birds, one of the smallest and one of the boldest; the wagtail scarcely bends the reed on which it perches, yet traverses the ocean in its flight.

The Biscayan orks, even the poorest, were gilt and painted.

This tattooing is in accordance with the genius of a people, charming, but the least bit savage. The magnificent motley of their mountains, checkered with snows and meadows, has taught them the stern prestige of ornament at any price. They are poor and grand; they put coats-of-arms on their hovels; they have big asses which they trick out with bells, and big oxen which they deck with feathers; their carts, whose wheels you may hear creaking two leagues off, are repainted, carved, beribboned. Your cobbler has a bas-relief over his door; Saint Crispin and an old shoe, but it's stone. They trim their leather jackets with gold lace; they don't mend a tatter, but they embroider it. Such is the depth and pride of their gayety. Like the Greeks, the Basques are children of the sun. While the Valencian shelters his sad nudity under a covering of red wool, with a hole for his head to go through, the Galicians and Biscayans rejoice in fair linen shirts, bleached in the dew. Their door-steps and windows overflow with fresh, blond faces, laughing under garlands of maize. A jovial and proud serenity is conspicuous in their simple arts, in their manufactures, in their customs, in the dress of their girls, in their songs. Those colossal ruins, the mountains, become masses of light in Biscay; the sunshine circulates through all their gaps. The savage Jaiquivel is full of idyls. Biscay is the embodied grace of the Pyrenees, as Savoy is of the Alps. In the perilous bays adjoining Saint Sebastian, Leso, and Fontarabia, you have tempest and cloud, foam spirting above the capes, rage of wave and wind, horror, confusion, and boat-women crowned with roses. Whoever has seen the Basque country wishes to see it again. There is a blessing on the land. Two crops a-year, villages resounding with gayety, a lofty poverty, all Sunday long a noise of guitars and dances, castanets and love-making, houses clean and well lighted, storks in the steeples.

Return we to Portland, that harsh mountain of the coast.

The peninsula of Portland, in its geometrical projection, presents the appearance of a bird's head, the bill turned toward the sea, and the back of the head toward Weymouth; the isthmus is the neck.

Portland, to the great deterioration of its wild picturesqueness, has now a manufacturing existence. The Portland hills were discovered by quarry-men and plasterers about the middle of the eighteenth century. Since that time, the cement called Roman has been made with Portland rock, a utilization which enriches the country and disfigures the bay. Two hundred years ago, these coasts were cliffs in ruins, now they are quarries in ruins; the pickaxe consumes on a small scale, the wave on a large; hence, a diminution of beauty. Man's measured cutting has replaced the grand waste of ocean. This measured cutting has annihilated the creek where the Biscayan ork was moored. To find any trace of this little harborage now demolished, one would have to look on the eastern side of the peninsula, toward the point, beyond Folly Pier and Dirdle Pier, beyond Wakeham even, between the places called Church-Hope and Southwell.

The creek, walled in on all sides by bluffs higher than it was wide, was every moment more encroached upon by the night; the indistinct mist peculiar to twilight grew thicker in it; it was like the spreading darkness at the bottom of a well; the narrow channel, where the creek gave passage to the sea, marked a whitish cleft in this interior darkness where the wave wandered. One must have been quite close to perceive the ork moored to the rocks, and hidden as it were in the cloak of their great shadow. A plank thrown from on board to a low, flat

projection of the cliff, the only point where one could land, connected the bark with the shore; black figures were walking on this movable bridge, and crossing one another in the darkness; people were embarking.

It was less cold in the creek than at sea, thanks to the screen of rock that rose on the north of this basin; but the difference was not sufficient to hinder these people from shivering. So they made haste.

Twilight has the effect of bringing out figures as if they were stamped; certain fringes in the dress of these people were visible, showing that they belonged to the class called in England *the ragged*.

Among the projections of the cliff a winding footpath was just distinguishable. The girl who hangs her staylace over the back of an arm-chair, and leaves it trailing, sketches, without suspecting it, nearly all the foot-roads of cliffs and mountains. The path leading to this creek, full of knots and angles, almost perpendicular, fitter for goats than men, ended at the platform where the plank was. Cliff roads are generally of a steepness far from tempting; they present themselves like a fall rather than a way, they crumble under your feet rather than lead you down. This one, probably a branch of some road on the plain, was so perpendicular that it was unpleasant to look at. From below you saw it zigzag up to the high ledges of the cliff, whence it opened out upon the table-land over sundry clefts, and through a notch in the rock. By this path must have come the passengers, for whom this bark was waiting in this creek.

Around the movement of embarkation in the creek, a movement evidently scared and unquiet, all was solitude. Not a step was heard, not a sound, not a breath. One could just perceive on the other side of the roadstead, at the entrance of Ringstead Bay, a flotilla of shark-fishers, which had clearly blundered in there. These polar vessels had been driven from the Danish waters into the English by the caprice of the deep. Northern gales play such tricks on fishermen. These men had just sought refuge in the anchorage of Portland, and this fact was a presumable sign of bad weather and danger on the open sea. They were employed in casting anchor. The chief bark, placed on sentry, according to the old custom of Norwegian flotillas, marked all its rigging in black on the white level of the sea, and forward might be seen the great fishing-fork, that bore all sorts of hooks and harpoons, destined for the *scyrmnus glacialis*, the *squalus acanthias*, and the *squalus spinax niger*, as well as the net for catching the *grand selache*. Except these few vessels, all swept into the same corner, the eye recognized nothing that lived in the vast horizon of Portland. At this time the coast was uninhabited, and at this season the roadstead was uninhabitable.

Whatever the aspect of the weather, the persons whom the Biscayan ork was to carry off, hurried their departure none the less for it. They formed, on the border of the sea, a sort of group, busy and confused, rapid in their movements. It was difficult to distinguish one from the other, impossible to see if they were old or young. The indistinctness of evening mixed them up, like the figures in a rough sketch. A mask of shade was upon their faces. They were profiles on the night. Their number was eight, one or two of whom were probably women, not easy to distinguish under the rags and tags in which the whole group was muffled, accoutrements which were no longer either men's or women's dresses. Tatters have no sex.

A smaller shadow, going and coming among the large ones, indicated a dwarf or a child.

It was a child.

## II.

### ISOLATION.

Thus is what might have been observed on closer inspection.

All wore long cloaks, full of holes and patches, but made

of stout cloth, hiding them up to the eyes if required—a good protection against the north wind and the curious. They moved with agility under these cloaks. Most of them, instead of hats, wore a handkerchief rolled round the head, a sort of rudimentary turban used by Spaniards. This head-gear was not at all extraordinary in England. The South, just then, was in fashion at the North, probably because the North used to beat the South. It triumphed over what it admired. After the defeat of the Armada, Castilian was an elegant court dialect with Elizabeth. To speak English before the English queen was almost “shocking.” To be influenced a little by the manners of those, to whom he gives law, is the custom of the barbarous victor in face of the polite vanquished. The Tartar contemplates and imitates the Chinaman. This is why Spanish fashions penetrated into England, while, on the other hand, English interests were working themselves into Spain.

One of the men in the embarking group looked like a leader. He wore Spanish buskins, his rags were embroidered and gilt, and a spangled waistcoat shone under his cloak like a fish's belly. Another pulled down over his face a great felt hat shaped like a *sombrero*. This hat had no hole for a pipe—mark of a learned man.

Over his tatters, on the principle that a man's coat makes a boy's cloak, the child wore, or was wrapped in, an old reefing-jacket that reached to his knees. His size denoted a boy of ten or eleven. He was barefoot.

The crew of the ork consisted of a master and two men.

Probably she came from Spain, and was returning thither. Doubtless she was on secret service from coast to coast.

The persons whom she was about to take in kept whispering together.

Strangely mixed was the mutual whispering of these creatures: now a Spanish word, now a German, now a French; sometimes Welsh, sometimes Basque. It was a *patois*, unless it was slang.

They seemed to be of all nations, and of the same band. The crew were probably of themselves, since they connived at their departure.

This diverse troop seemed a company of comrades, perhaps a set of accomplices.

Had there been a little more light, and had one regarded them a little carefully, there might have been seen on these people chaplets and scapulars half concealed under their rags. One of the might-be women mixed with the group had a rosary nearly equal in the size of its beads to a dervish's, and easy to recognize as a rosary of Llanymtheffry, called also Llandiffry.

Had it not been so dark, one might also have observed a *Nuestra Señora* with her *niño*, carved and gilt, in the forepart of the ork, probably the Basque Virgin, a sort of *panagia* of the old Cantabrians. Under this image, which took the place of a figure-head, was a cage for combustibles, at present unlighted, an excess of precaution which showed extreme care for concealment. This fire-cage was clearly for two purposes; when lit, it burned in honor of the Virgin, and also lighted the sea, like a beacon doing duty as church candle.

The cutwater, long-curved and sharp under the bowsprit, sprang from the bow like a crescent horn. Low down in the cutwater, under the Virgin's feet, knelt an angel, his back against the stem, and his wings spread, regarding the horizon through a spy-glass. The angel was gilt like the Virgin.

In the cutwater were openings and passages to admit the waves, another chance for gilding and arabesque.

Under the Virgin was painted, in gilt capitals, the word *Matutina*, the ship's name, now illegible by reason of the darkness.

At the foot of the cliff was deposited, in the pell-mell disorder of their flight, the lading which these passengers took with them, and which, thanks to the plank serving as gangway, passed rapidly from the shore into the vessel. Bags

of biscuit, a keg of stockfish, a box of portable soup, three barrels, one of fresh water, one of malt, one of tar, five or six bottles of ale, an old portmanteau, with straps and buckles, some trunks, some chests, a ball of tow for torches and signals, such was this lading. These ragged gentry had baggage, which seemed to indicate a wandering life; walking beggars are obliged to own something; at times they would fain fly away like birds, but they cannot do so without abandoning their means of livelihood. Whatever their wandering business may be, they must have boxes of tools and instruments to work with. So these men carried this luggage, an encumbrance on more than one occasion.

It could not have been easy to transport all these traps to the bottom of such a cliff. The fact, moreover, disclosed an intention of quitting for good. No time was lost; there was a continual movement from the shore to the ship, and from the ship to the shore; each took his part of the work; one carried a bag, another a box. The possible or probable women in this mixed mass worked like the rest. The child was overloaded.

It may be doubted if this child had father or mother in the band. They took no notice of him. They made him work, that was all. He seemed, not a child in a family, but a slave in a tribe. He waited on everybody, and nobody spoke to him.

But he made haste, and, like all the doubtful troop of which he formed a part, seemed to have only one thought, that of embarking speedily. Did he know why? Probably not. He hurried mechanically, because he saw the others hurry.

The ork was a decked vessel. The stowage of the freight in the hold was promptly arranged; the moment had come to weigh anchor. The last case had been landed on the deck; there were only the men to ship. Those two of the band who appeared to be their women were already on board; six, including the child, were still on the low platform of the cliff. A movement of departure was made in the vessel, the master seized the tiller, a sailor took an axe to cut the mooring cable. To cut it, a sign of haste; one casts off when there is time. He of the six who seemed their chief, and had spungles on his rags, said in a low voice, *Andamos* (“We are going”). The boy darted toward the plank, to pass first. As he was putting his foot on it, two of the men, rushing forward at the risk of throwing him into the water, entered before him; a third shouldered him aside and passed; the fourth kept him off with his fist and followed the third; the fifth, who was the chief, bounded into the bark rather than entered it, and, as he leaped in, pushed with his heel the plank, which fell into the sea; an axe-stroke severed the cable, the tiller shifted, the ork left the shore, and the boy remained on land.

### III.

#### SOLITUDE.

THE boy remained motionless on the rock, his eyes fixed. He uttered no call. He made no remonstrance. Yet it was unexpected; but he said not a word. In the ship there was the same silence. On both sides a mute acceptance of the increasing interval. Not a cry from the child to these men, not an adieu from these men to the child. It was like a separation of shades on the banks of a Styx. The child, as if nailed to the rock which the high tide was beginning to wash, looked after the departing ship. He seemed to understand—what? The dark.

Another moment, and the ork had reached and entered the strait which led out of the creek. The top of the mast was visible against the clear sky above the cloven blocks through which, as between two walls, the strait wound its way. The topmast quivered above the rocks, and seemed to sink into them. It disappeared. All was over. The bark had gained the sea.

The child beheld this disappearance, astonished, but reflecting. His stupefaction was complicated with a dark proof of

what life is. There seemed to be some experience in this young creature. Perhaps he was already a judge. Trials, come too soon, sometimes form in the depth of childhood's dim reflections a strange and fearful balance, in which these poor little souls weigh their God.

Feeling himself innocent, he submitted. Not a complaint. The irreproachable reproaches not.

The brusque elimination made of him could not wring from him even a gesture. He seemed to stiffen from within. Under this sudden assault of fate, which threatened to put the end of his existence almost before its beginning, the boy did not bend. He received this thunder-stroke upright.

To one who could have seen him thus astonished but not crushed, it would have been evident that, in the group who were abandoning him, nothing loved him, and he loved nothing.

Thoughtful, he forgot the cold. Suddenly the water moistened his feet; the tide was rising; a breath passed through his hair; the gale was coming. He shuddered. In waking from his trance he trembled from head to foot.

He cast his eyes around him. He was alone.

Till that day there had been for him no other men on earth than those now in the ork. These men had just fled.

Let us add, strange as it must sound, that these men, the only ones whom he knew, were unknown to him. He could not have told who they were.

His infancy had been passed among them, without his feeling that he was one of them. He was in contact with them; nothing more.

And now they had just forgotten him.

He had no money about him, no shoes on his feet, hardly clothes on his back, not even a bit of bread in his pocket.

It was winter and night; he had several leagues to go before reaching a human dwelling.

He knew not where he was. He knew nothing, except that those who came with him to the border of this sea had gone away without him. He felt himself put out of life. He felt his kind give way from under him.

He was ten years old.

The boy was in a desert, between depths where he saw the night rise, and depths where he heard the waves growl.

He stretched his thin little arms and yawned. Then suddenly, like one who has made up his mind, and bravely shaking off his lethargy, with the nimbleness of a squirrel—or a clown if you will—he turned his back to the creek and began to mount along the cliff. Alert and fearless of danger, he scaled the path, left it, came back to it. He was now hurrying toward the land as if he had a map of his route. Yet he was going nowhere. He was hastening without an object, like a fugitive before destiny.

Man climbs, brutes creep up; he climbed and crept. The Portland bluffs looking toward the south, there was scarcely any snow on the path. But what there was had been converted by the intense cold into powder, inconvenient enough to walk in. The boy got on as he best could. His man's jacket, too large for him, was an additional encumbrance. From time to time he found on an overhanging ledge, or in a declivity, a little ice which tripped him up. After hanging some moments over the precipice, he would hook himself on to a dry branch or projecting stone. Once he had to do with a flawed vein of rock which suddenly crumbled under him, drawing him along in its ruin. These clefts in flawed rocks are treacherous. The child slid for some seconds like a tile on a roof; he rolled down to the very verge of destruction and clutched a tuft of grass just in time to save himself. He did not scream at the abyss any more than he had screamed at the men; having made good his footing, he recommenced the ascent in silence. The face of the cliff was lofty, so that he met with changes and chances. Darkness increased the size of the precipice. This perpendicular rock had no end. It receded before the boy in the

heights above. The summit seemed to rise in proportion as he rose. Even in the act of climbing, he gazed on the black entablature, placed like a barrier between him and the sky. At last he reached the top.

He leaped upon the upland. We might almost say he landed, for he issued from the gulf.

Hardly was he off the cliff when he shivered. He felt in his face the night gale biting him. The sharp northwest wind was blowing. He hugged his sailor's jacket against his breast. It was a good garment. In naval language it is called a sou'-wester, because this kind of woollen coat is impenetrable by the southwest rains.

The child, having reached the upland, stopped, planted his two naked feet firmly on the frozen soil, and looked around.

Behind him the sea, before him the land, overhead the heaven. But a heaven without stars. An opaque mist masked the zenith.

On reaching the top of the rocky wall, he found himself turned toward the land, and looked at that first. It stretched before him far as he could see, flat, frozen, covered with snow. Some tufts of heath shivered here and there. No roads visible. Nothing, not even a shepherd's hut. In some spots were seen pale, eddying wreaths, whirlwinds of fine snow torn from earth by the gale and flying away. The horizon was plated, as it were, with successive undulations of land, now suddenly wrapped in mist. The great wan plains were disappearing under the white fog. Profound silence; the expanse of infinity, the quiet of the tomb.

The child turned round to the sea.

The sea was as white as the land, the one with snow, the other with foam. Nothing could be so melancholy as the light of this double whiteness. Some night illuminations have very hard and clean shadows; the sea was steel, the cliffs ebony. From the elevation at which the boy stood, Portland Bay appeared almost as on a map, all wan within its semicircle of hills; there was something dreamy about this nocturnal landscape, a pale circle enclosed in a dark crescent. The moon sometimes presents a similar appearance. From one cape to the other, along all the coast, not a single spark could be seen to indicate a hearth-fire, a window-light, an inhabited house. On earth, as in heaven, there was absence of light; not a lamp below, not a star above. The wide, smooth waves of the gulf were here and there suddenly uplifted. The wind disarranged and wrinkled them like table-cloths. The fleeing bark was still visible in the bay, a black triangle gliding over the livid waves. Far off, the watery wastes were vaguely agitated, in the gloomy visible darkness of immensity.

The *Matutina* shot swiftly along. She grew smaller every moment. Nothing is so rapid as the melting away of a ship in the sea distance. At one moment she lit her bow lantern; probably the darkness about her was growing troublesome, and the helmsman felt the need of light on the water. This luminous point, this spark visible from afar, clung sadly to the high, long, black shape. It was like a winding-sheet upright and walking in the midst of the sea, and some one prowling under it with a star in his hand.

There was a storm threatening in the air. The child did not regard it, but a sailor would have trembled. It was that moment of prescient anxiety when it seems as if the elements are about to become persons, and we are going to be present at the mysterious transformation of the wind into Aquilo. The sea will be Ocean; the forces of Nature will reveal themselves as wills; what we take for a thing is a soul. We shall soon see. Hence comes horror; the soul of man fears to be thus confronted with the soul of Nature.

Chaos was coming on the stage. The wind, ruffling the fog, and piling up the clouds behind, was arranging the scenery for that terrible play of wave and winter which is called a snow-storm.

The symptom of returning ships showed itself. Within a

few minutes the roadstead was no longer empty. Scared barks, hurrying toward the anchorage, rose to view at every moment behind the capes. Some doubled Portland Hill, others Sainte Albans' head. Sails were coming from the farthest distance. It was who should find a refuge first. Southward, the darkness was increasing, and the clouds, full of the night, were descending on the sea. The weight of the overhanging storm mournfully hushed the waves. It was not a time for starting. Yet the ork had gone.

She had steered southward, was already out of the gulf and on the open sea. Suddenly the wind blew a squall; the *Matutina*, which could still be clearly seen, covered herself with canvas, as if resolved to profit by the hurricane. It was a northwester, sullen and angry; it fell on the ork with stubborn fury. Taken in flank, the vessel heeled over, but did not hesitate, and kept out to sea. This indicated a flight rather than a voyage, less fear of the sea than of the land, and more anxiety about the pursuit of men than about that of the winds.

Passing through all the stages of diminution, she buried herself in the horizon; the little star which she trailed with her, into the shadow, grew pale; the ork, melting more and more into the night, disappeared, this time forever. At least the boy seemed to understand it so. He ceased looking at the sea. His eyes went back to the plains, the downs, the hills, the places where it was perhaps not impossible to find something alive. He started in this unknown land.

## IV.

## QUESTIONS.

WHAT was this fugitive band that had left this child behind? Were these runaways *Comprachicos*?

We have already seen in detail the measures taken by William III., and voted by Parliament, against the malefactors, male and female, called *Comprachicos*, or *Comprapequeños*, or *Cheyilas*.

There are enactments that have a scattering effect. This statute falling on the *Comprachicos* caused a general flight, not only of the *Comprachicos*, but of vagabonds of every kind. It was a regular devil-take-the-hindmost. Most of the *Comprachicos* went back to Spain. We have said that many of them were Basques.

The first result of this law to protect childhood was singular enough—a sudden abandonment of children. The penal statute brought forth at once a crowd of foundlings, that is to say lost-lings. Nothing easier to understand. Every wandering troop that contained a child was suspected; the mere fact of the child's presence was an information. These are probably *Comprachicos*—such was the first idea of the sheriff, the provost, the constable. Arrests and investigations followed. People, simply wretched, reduced to prowl about begging, were terrified at the idea of passing for *Comprachicos*, which they were not—but the weak are shy of the possible mistakes of justice. Besides, these vagabond families are habitually timorous. The charge against the *Comprachicos* was the utilization of others' children. But such are the comminglings of poverty and distress that it was sometimes difficult for a father and mother to prove that their own child *was* theirs. Where did you get this child? How could they prove that he came from God? The child became a danger; they got rid of him: flight was easier alone; father and mother decided to lose him, it might be in a wood, or on the sea-shore, or in a well. Drowned children were found in cisterns.

Let us add that, in imitation of England, the *Comprachicos* were from that time fair game all over Europe. The signal for pursuit had been given. There is nothing like setting a mark on people. Henceforth, there was rivalry among all the police-forces to seize them, and the alguazil kept as sharp a watch as the constable. Only twenty-three years ago, you might still read, on a stone of the gate of Otero, an inscription untrans-

latable—for the wording of law disregards decency—marking, moreover, in a very matter-of-fact way, the shade of difference between the child-trader and the kidnapper. Here it is in the original rough Spanish: *Aquí quedan los orejas de los comprachicos y las bolsas de los robaníños. Mientras que se van ellos al trabajo de mar.* You see that the confiscation of their ears, etc., did not hinder them from going to the galleys. So there was a general rout of the vagabonds. They started in fear, they arrived in a tremble. Along all the coast of Europe these stealthy arrivals were watched. It was impossible for a band to embark with a child, for it was dangerous to disembark with one. To lose the child was the shortest way.

Who had cast off the child, whom we have just seen darkly in the dark solitude of Portland?

Probably some *Comprachicos*.

## V.

## THE TREE OF HUMAN INTERVENTION.

It might be about seven in the evening. The wind had lulled, a sign that it would soon rise again. The boy was on the extreme south upland of Portland point.

Portland is a peninsula. But the child knew not what a peninsula was, and did not even know the word Portland. But one thing he did know, that a person may walk till he drops. An idea is a guide, but he had no ideas. They had brought him there, and left him there. *They* and *there*, these two riddles, represented his whole destiny; *they* were the human race, *there* was the universe. Here below he had absolutely no starting-point except the small portion of ground where he placed his heel, hard ground it was too, and cold to his naked feet. In the great world opening all around him in the dim twilight, what was there for this child? Nothing.

Toward this nothing he was advancing.

All around him spoke of the total absence of man.

He crossed the first plateau diagonally, then a second, then a third. At the end of each, the boy found a break in the ground; the slope was sometimes abrupt, but always short; for the high, barren downs of Portland point are like great flag-stones partly overlapping. The south side seems to underlie the preceding plain, and the north side rises above the next one. These places the boy had to cross by jumping, which he did with much agility. From time to time he checked his progress, and seemed to hold counsel with himself. The night was growing very dark, and his range of vision shortening; he could only see a few steps off.

Suddenly he stopped, listened a moment, and a slight movement of the head showed his satisfaction, as he turned rapidly and made for a moderate elevation which he perceived dimly on his right, at that spot of the plain which was nearest the cliff. On this eminence was a form which, through the mist, resembled a tree. The child had just heard in that quarter a noise, which was not the noise of the wind or the sea, neither was it the cry of any animal. He thought some one was there.

A few strides brought him to the foot of the mound. There was some one there, sure enough.

The doubtful object on the top of the elevation was now clearly visible. It was like a great arm rising straight out of the earth. At the upper end of this arm a sort of forefinger, propped underneath by its thumb, reached out horizontally. This arm, this thumb, and this forefinger, traced a carpenter's square against the sky. At the junction of this sort of thumb and sort of finger was a cord from which hung something black and shapeless. This cord, moved by the wind, made a noise like a chain, and this was the sound which the child had heard.

The cord, seen close, was what its sound denoted, a chain; a ship-chain with half-solid rings.

By that mysterious law of amalgamation which, throughout all nature, accumulates appearances upon realities, the place, the hour, the mist, the tragic sea, the distant agitations in the

horizon, all heaped themselves on this profile and made it seem of enormous size.

The object attached to the chain resembled a large sheath. It was swaddled like an infant and as tall as a man. The upper part was round, and the end of the chain wound about it. The bottom was jagged, and bones came through the holes.

A light breeze shook the chain, and that which hung on the chain waved softly. This passive mass obeyed the vague quiverings of surrounding space. It had an indefinable horror; the fear which makes objects disproportionate had almost taken away its size in leaving its shape. It was an essence of blackness with an aspect of its own, night above and night within. It was a prey to sepulchral exaggeration. Twilights, moon-rises, and star-sets, the clouds, those log-lines of space, all the winds of the compass, had finally entered into the composition of this visible nonentity. This block hanging in the wind shared the impersonality scattered far over sea and sky, and the darkness was finishing the thing that had been a man.

It was that which no longer is.

To be a remnant—human language cannot express the idea. To exist no longer and yet to persist, to be in the gulf and out of it, to reappear above the wave of Death as if refusing to be swallowed up—there is a certain amount of impossibility mixed with such realities, and therefore they are unspeakable. This being—if it was a being—this sombre witness—here were remains and terrible remains. Remains of what? First of nature, then of society. Cipher, and total.

The elements in their unmitigated rigor had it at their mercy. The profound forgetfulness of solitude encompassed it. Exposed to unknown adventures, without defence against the will of the darkness, it was forever suffering. The hurricanes were upon it, fulfilling their gloomy mission.

This spectre was given up to plunder. It suffered that horrible outrage, putrefaction in the open air. An outlaw of the coffin, it was annihilated without reposing, falling into ashes by summer and into mud by winter. Death needs a veil, the tomb requires modesty; there was no veil, no modesty here. Shameless and open rotteness. When Death shows his work, he is impudent. He insults all the decencies of the shade when working outside of his laboratory, the tomb.

This dead creature was stripped. Stripping the stripped, inexorable end. No more marrow in his bones, no more entrails in his stomach, no more voice in his throat. A corpse is a pocket, turned inside out and emptied by death. If he had possessed a personality, where was it? Perhaps still there, and that was grievous to think of. Something flitting around, something chained. Can one imagine a more ghastly feature of darkness?

There are realities here below resembling egresses to the unknown, by which it seems possible for our thoughts to go out, and which our conjectures seize upon. Imagination has its *compelle intrare*. Pass through certain places and before certain objects; you cannot help stopping, giving yourself up to dreams and letting your mind go on. In the invisible there are dim gates ajar. None could have lighted on this dead man without meditating.

He was wasting silently, but on a great scale. His blood had been drunk, his skin eaten, his flesh stolen. Nothing had passed without taking something from him. December had borrowed of him its cold, midnight its terrors, the iron its rust, the plague its miasma, the flower its perfume. His slow disintegration was a toll—a toll paid by the corpse to wind, rain, and dew, birds, and reptiles. All the dark hands of night had rummaged this body.

A strange, indescribable dweller this, who dwelt in the night. He was in a plain and on a hill, and he was not there. He could be touched, and yet he had vanished. He was something shadowy that made the darkness complete. After the disappearance of the day, in the vast, still gloom, he was gloomily of a piece with every thing. By his mere presence

he increased the melancholy of the storm and the calm of the stars. The inexpressible sense of the desert became concrete in him. Waif of an unknown destiny, he figured in all the savage concealments of night. In his mystery was a vague reflection of all enigmas.

All round him was sensible a diminution of life, as it were, which went to the very depths. The inanimate neighborhood had less certainty and confidence. The shudder of the grasses and brushwood, a lonely melancholy, an anxiety that seemed conscious, tragically appropriated all the landscape for this dark figure hanging by its chain. The presence of a spectre on the horizon aggravates solitude.

It was a phantom, implacable because exposed to blasts that were never lulled. The eternal commotion made it terrible. It seemed, fearful to say, a centre of space, with something immense resting on it. Who knows? Perhaps that equity, dimly seen and defied here, which is beyond our justice. In its sojourn outside the tomb, men's vengeance was mixed with its own. It bore testimony in the twilight and the desert. It proved that matter may disquiet us, for the matter before which we tremble is the ruin of our spiritual body. For dead matter to trouble us, mind must have inhabited it. This object denounced the lower law to the higher. Placed there by man, it waited for God. Huge, fantastic shadows, with all the dubious turns of cloud and wave, floated above it.

Behind this vision was some dark, indefinite obstacle. Around this corpse was infinity, broken by nothing; not a tree, not a roof, not a traveller. When the vastness that overhangs us, be it heaven or abyss, life, death, eternity, appears open, it is then that we feel every thing inaccessible, shut off, walled up. The opening of the infinite is the most formidable closing.

Before this thing stood the child, mute, astonished, staring.

For a man it would have been a gallows, for the boy it was a ghost. Where the man would have seen the body, the boy saw the spectre. Besides, he did not understand it.

There are fascinations of all kinds. There was one on the top of this mound. The child took a step, then two. He ascended, though he wanted to descend, and advanced, though he wanted to retreat.

Bold, yet trembling, he went to make a close examination of the phantom. When he had arrived under the gibbet, he raised his head and took a survey.

The phantom was tarred; in places it shone. The child could make out the face. It was coated with bitumen, and this sticky, tenacious mask seemed to shape itself by the nocturnal reflections. The boy saw the mouth, which was a hole, the nose, which was a hole, the eyes, which were two holes. The body was wrapped and almost packed in a coarse canvas impregnated with naphtha. This canvas was rotten and cracked. A knee passed through. One slit exposed the ribs. Part was body, part bones. The face was clay-color; some slugs had wandered over it, leaving vague silvery ribbons. The canvas, sticking to the bones, brought them out, like the drapery of a statue. The skull, cracked and split, was parted like a rotten fruit. The teeth had remained human; they had preserved their smile. A departing cry seemed to sound in the open mouth. There were some whisker-hairs on the cheeks, and the head, hanging on one side, seemed to pay attention.

There had been recent restoration. The face was freshly tarred, as well as the knee which projected through the canvas, and the exposed ribs. The feet below were uncovered. Just under them in the grass might be seen two shoes, grown shapeless in the snow and rain. They had fallen from the body.

The barefooted child looked at these shoes. The wind, more and more threatening, had those lulls which are part of the preparations for a storm; for some minutes it had ceased entirely. The carcass did not stir. The chain was motionless as a plumb-line.

Like all new-comers into life (taking into account the special pressure of his destiny), the child had in him doubtless that awakening of ideas peculiar to young years which tries to open the brain, and resembles the peckings of a bird in the egg; but all that his slight consciousness embraced at that moment was resolved into stupor. Excess of sensation, like too much oil in a lamp, finishes by stifling thought. A man would have questioned himself; the boy kept on looking.

The tar gave a moist aspect to this countenance. The drops of bitumen, congealed in what had been eyes, looked like tears. Moreover, thanks to the bitumen, the waste of death had been visibly slackened, if not stopped, and reduced to the least possible damage. What the child had before him was an object of care. This man was evidently valuable. He had not been worth keeping alive, but they made a point of preserving him when dead. The gibbet was old and worm-eaten, but solid, and had been many years in use.

It was an immemorial English custom to tar smugglers. They were hung on the shore, coated with bitumen, and left hanging; warnings require open air, and tarred warnings keep better. And this tar was humane, for thus the gibbeted ones required renewal less frequently. The gallows were placed at intervals along the coast, as lamp-posts are now. The hanged man did duty for lantern. He lighted, after his fashion, his comrades, the smugglers. They saw the gibbets far off at sea. Here's one, first notice; there's another, second notice. All which did not stop smuggling, but social order is built up of such things. This fashion lasted in England down to the beginning of our century. In 1822 three varnished culprits might be seen hanging before Dover Castle. Nor was the protective process limited to smugglers. England put her robbers, her incendiaries, and her assassins to the same use. John Painter, who set fire to the dockyard of Portsmouth, was hanged and tarred in 1776. The Abbé Coyer, who calls him John the Painter, saw him again in 1777. John Painter was hanged in chains over the ruin of his own making, and furbished up from time to time. This carcass lasted, one might almost say, lived, nearly fourteen years. In 1788 he was still in good working order, but in 1790 he had to be replaced. The Egyptians set store by kings' mummy; people's mummy, it seems, can be useful also.

The wind, having a strong hold on the mound, had stripped it entirely of snow. The grass was reappearing on it, with some thistles here and there. The hill was covered with that close, short marine turf which makes the tops of cliffs look like green cloth. Under the gallows, at the very spot above which hung the criminal's feet, was a high, thick tuft, remarkable on that barren soil. The bodies fallen piecemeal there for ages explained the beauty of the grass. The earth fattens upon man.

A sad fascination held the child. He remained there, open-mouthed. He only stooped down a moment for a nettle which pricked his legs, and stung him like a reptile. Then he stood straight again and looked up to the face which looked down on him. Looked at him all the more because it had no eyes. It was a general gaze, an indescribable, darkly-gleaming stare, which came from the skull and the teeth as much as from the void spaces under the eyebrows. The whole head of the dead man looks at you, and that makes it terrible. You feel you are seen without eyeballs; this makes the spectre horrid.

Gradually the child himself became terrible. He did not stir. Torpor was gaining on him. He did not perceive that he was losing consciousness. He was growing numb and stiff. Winter was silently betraying him to night, for winter is treacherous. The child was almost a statue. The petrifying cold penetrated his bones; the darkness was creeping into him like a reptile. The stupefying emanation of the snow rises in man like a dim tide; the boy was slowly absorbed in an immobility resembling that of the spectre before him. He was about to fall asleep.

In the hand of sleep is the finger of death. The boy felt himself seized by that hand. He was on the point of falling under the gibbet, and could no longer tell whether he stood.

The end always imminent, no transition between being and ceasing to be, the return to the crucible, the possible slipping off at any moment, such a precipice is creation.

A moment more, and child and corpse, the life just sketched and the life in ruins, would be joined in the same annihilation. The spectre seemed to understand this and wish to prevent it. Suddenly it began to move. It looked as if it would warn the child. It was the wind beginning to blow again.

Nothing so strange as this corpse in motion. The body at the end of the chain, impelled by an invisible breath, assumed an oblique attitude, rose to the left, fell back, rose to the right, kept rising and falling with a slow and deadly mechanical precision. Frightful see-saw! One might have imagined in the gloom the pendulum of eternity's clock.

It lasted some time. At this agitation of death the boy felt awakened, and was positively frightened through his chill. The chain, at every oscillation, creaked with hideous regularity. It seemed to take breath, then began again, and its creaking was like the chirp of a tree-cricket.

An approaching squall causes sudden puffs of wind. The breeze became a gale all at once. The swing of the carcass received a funereal emphasis. It was no longer balanced but shaken, and the chain screamed instead of creaking. It seemed that the scream was heard. If a call, it was answered. From the far horizon a great noise came up. It was the noise of wings.

An incident was at hand, the stormy incident of churchyards and solitudes, the arrival of a flock of ravens.

Black flying spots dotted the clouds, pierced the fog, grew larger, drew nearer, joined, thickened, as they hurried toward the hill, uttering their cry. It was like the coming of a legion. These winged vermin of the gloom pounced upon the gibbet. The child recoiled in terror.

Swarms obey orders. The ravens were grouped on the gallows. Not one on the body. They talked together. Croaking is frightful. Howling, hissing, roaring belong to life; croaking is a satisfied acceptance of putrefaction. It is like the sound which breaks the silence of the tomb. Croaking is a voice with night in it. The boy was petrified—with fright even more than with cold.

The ravens stopped croaking. One of them lighted on the skeleton. This was the signal. All threw themselves upon it; there was a cloud of wings; then all the feathers closed, and the spectre disappeared under a cluster of black blisters stirring in the darkness. At this moment the dead man shook himself.

Was it he or the wind that did it? He gave a frightful bound. The rising hurricane came to his help. The phantom went into convulsions. It was the squall, now blowing its hardest, that took hold of him and shook him in every direction. He became horrible. He struggled like a madman. Fearful puppet, with a gallows-chain for string! Some ghostly jester had seized the cord and was playing with the mummy. It turned and jumped as if about to disjoint itself. The birds flew away in terror: all these loathsome creatures rebounded, as it were. Then they came back, and a fight began.

The dead man seemed endowed with monstrous life. The blasts lifted him as if they would carry him off, he looked as if struggling and trying to get away; his fetters kept him back. The birds followed all his motions, recoiling, then rushing on, scared but obstinate. On one side a strange attempt at flight, on the other pursuit of a chained object. Impelled by every spasm of the gale, the corpse threw somersets, had fits of anger, went and came, rose and fell, repelling the scattered swarm. The dead man was a club, the ravens powder. The flock of fierce assailants obstinately refused to quit its hold. The corpse, as if maddened under this pack of beaks, multiplied

his blind blows in the void, like strokes of a stone tied to its sling. Sometimes he had all the claws and wings upon him, then nothing; the band would vanish and immediately return in full fury. Frightful punishment, continuing after life. The birds seemed frenzied. Such swarms ought to issue from the air-holes of hell. Blows of beak and claw, tearings-off of fragments no longer flesh, crackings of the gallows, rustlings of the skeleton, clankings of rusty iron, shrieks of the squall—what struggle could be more dismal? A spectre was matched against demons.

At times, when the gale redoubled its violence, he pivoted upon himself, faced the swarm on all sides at once, seemed to wish to run after the birds; his very teeth looked as if desirous to bite them. He had the wind for him and the chain against him, as if the dark deities were involved in the affair. The hurricane joined in the battle. The corpse twisted itself, the flock of birds rolled over him in a spiral.

It was a whirl in a whirlwind.

And below all was heard a huge rumbling. That was the sea.

The boy saw this vision. Suddenly he began to tremble in all his limbs, a shiver coursed through his body, he staggered, shook, all but fell, turned round, pressed both hands on his forehead, as if it were a support, then, haggard, with dishevelled hair and closed eyes, he descended the hill at full speed and took to flight, leaving this nocturnal battle behind him.

## VI.

### THE NORTH POINT OF PORTLAND.

He ran till he was blown, at random, lost, in the snow, in the plain, in space. This flight restored him to warmth. He needed it: without the run and the scare he would have died.

When his wind gave out, he stopped. But he dared not look back. He thought that the birds must be pursuing him, that the corpse must have unfastened its chain and was probably coming the same way as himself, that doubtless the very gibbet was running down the hill after the corpse. He feared to see this if he looked round.

When he had recovered his breath a little, he renewed his flight.

To sum up facts is not the province of childhood. Despite his growing terror he received impressions, but without connecting them in his mind or drawing conclusions. He was going, it mattered not whither or how, running with the pain and difficulty of one in a nightmare. Nearly three hours had passed since he was deserted; now his forward march, while remaining uncertain, had changed its object; before he was in search, now he was in flight. He was no longer hungry or cold, only frightened. One instinct had replaced another. His only thought now was to escape. Escape from what? from every thing. Life, from all sides, seemed like a horrible wall around him. Could he have escaped from things altogether, he would have done it.

But children are not acquainted with that jail-breaking which we call suicide.

So he ran on.

He ran for an indefinite time. But breath gives out, and so does fear also.

All at once, as if seized with a sudden access of energy and intelligence, he stopped, looking ashamed of running away; he drew himself together, stamped his foot, boldly lifted his head; and turned about.

There was no more hill, nor gibbet, nor flight of ravens.

The fog had regained possession of the horizon.

The boy pursued his course.

But now he did not run; he walked. To say that this meeting a corpse had made a man of him, would be to limit the manifold and confused impression which he was undergoing. There was much more and much less in it. This gibbet, very

dubious in the rudimentary apprehension of his thoughts, remained for him an apparition. But an overcome terror strengthens, and he felt himself stronger. Had he been old enough to fathom his own mind, he would have found in himself a thousand other incipient meditations, but the reflection of children is unformed; it is much if they feel the bitter after-taste of the thing, for them obscure, which the developed man calls indignation.

Besides, a child has the gift of promptly accepting the close of a sensation. Those distant and vanishing outlines, which form the aggravation of painful things, escape his notice. The child is protected against too complex emotion by the very weakness which is his deficiency. He sees the fact, and few things with it. The difficulty of contenting one's self with partial ideas does not exist for him. The trial of life begins later, when experience arrives with its brief. Then the groups of encountered facts are confronted, a grown and instructed intelligence compares them, the recollections of youth reappear under our passions like a palimpsest under its erasures; these recollections are logical grounds, and what was a vision in the child's brain becomes a syllogism in the man's. But experience varies, turning out well or ill according to the difference of natures. The good ones ripen, the bad ones rot.

The boy had run a full quarter of a league, and walked another quarter. Suddenly he felt a cramp in his stomach; then occurred suddenly to him an idea which immediately eclipsed the hideous apparition on the hill—that of eating. Luckily there is in man an animal nature which brings him back to reality.

Eat? what? and where? and how?

He felt in his pockets—mechanically, for he well knew that they were empty.

Then he quickened his steps. Without knowing whither he went, he hastened toward a possible lodging.

This faith in an inn is one of the roots of man's trust in providence.

To believe in a sleeping-place is to believe in God.

But on this snowy plain there was nothing that resembled a roof.

The child kept walking, the upland still spread before him, naked as far as the eye could reach.

There had never been a human habitation on this table-land. It was at the foot of the cliffs, in holes of the rock that they dwelt formerly, for want of wood to build huts—those old primitive inhabitants who had slings for weapons, dried cow-dung for fuel, for religion the idol Heil that stood in a clearing at Dorchester, and for occupation the fishery of that gray false coral which the Welsh used to call *plin* and the Greeks *Isidia plocamos*.

The child reconnoitred as he best could. All our life is a meeting of cross-roads where the choice of directions is perilous. This young creature had an early option of doubtful chances. Still he kept on; but though his legs seemed of steel, he began to tire. No paths in this plain; if there had been any, the snow had effaced them. Instinctively he continued to shift his course eastward. Sharp stones had flayed his heels; had it been light enough, there might have been seen, in his footsteps on the snow, red marks of blood, his blood.

He remembered nothing. He was crossing the table-land from south to north, and the band with which he came had probably crossed it from west to east, for fear of meeting some one. They had apparently started in some fisher's or smuggler's bark from some point of the Uggescombe coast, such as Saint Catherine-Chap or Swansea, to catch at Portland the ork which awaited them there, and they must have disembarked in one of the creeks of Weston to reëmbark in one of the creeks of Eston. This route was cut at right-angles by that which the lad now took. It was impossible for him to recognize his road.

The Portland table-land has here and there high swells,

cut short by the proximity of the coast, and perpendicular toward the sea. The boy came to one of these lofty points and stopped there, hoping to find more signs in a larger space, trying to see something. All his horizon was a vast livid opacity. He examined it attentively, and, under his fixed look, it became less indistinct. At the bottom of a distant fold of land, eastward, under this livid opacity, this sort of wan, moving bluff, which looked like a cliff cut out of night, crept and floated some dim black rags, a species of scattered fragments. This pale opacity was the fog, these black rags were smoke. Where there is smoke there are men. The child bent his steps that way.

At some distance he could just see a descent, and at the foot of the descent, among the shapeless forms of rock looming through the mist, something like a sand-bank or tongue of land, which probably joined the table-land that he had just crossed to the plains on the horizon. That was clearly his way. In fact, he had arrived at the isthmus of Portland, a sort of delta called Chess Hill.

He entered on the slope of the table-land. It was a hard descent, the counterpart of the ascent which he had made to get out of the bay, only less rugged. Whatever goes up, must come down. He rolled down, after having climbed up.

He leaped from one rock to another, at the risk of a sprain or a tumble into the dim depth. To hold himself back while slipping over the rocks and the ice, he clutched at the long rushes of the downs and the prickly furze, and all their points pierced his fingers. Sometimes he found a smooth declivity for a little way, and took breath as he descended; then it was steep again, and every step required a manœuvre. In descending precipices, every movement solves a problem; you must be skilful, under pain of death. The boy solved these problems with an instinct which a monkey would have remarked, and a science which a mountebank would have admired. The descent was steep and long, but he came to the end of it. The moment gradually approached when he would land on the dimly-seen isthmus.

At intervals, without ceasing to jump or slide from rock to rock, he pricked up his ears, like a deer listening. Far off on his left, he heard a faint, pervading noise, like the low note of a trumpet. There was in the air that movement of blasts preparatory to the terrific north wind, which one hears coming from the pole like a host of clarions. At the same time the child felt now and then on his forehead, his eyes, his cheeks, something which had the effect of the palm of a cold hand laid on his face. It was the large icy flakes, at first dropping gently, then in whirls, announcing the snow-storm. The child was covered with them. The snow-storm, which for more than an hour had been on the sea, was reaching the land. It invaded the downs gradually. It entered obliquely by the northwest on to Portland Heights.

### MARY SHEA.

"THE desolate orphan," who now came forward and exhibited not merely her bright eyes but her full form to my view, was somewhat singular in her appearance. She had but little of the original Celt in her features. Her beauty was purely Spanish, of which I have seen many perfect specimens in Tuosist and around Kenmare: large soft eyes, with beautiful dark downy eyelashes, the mouth well formed, and cheek of classic mould; while the figure, perfect in its symmetry, is erect and active, and exhibits a lightness of step and grace of motion which can rarely be attained but by constant practice in walking over the mountains. The form which now stood before me was a beautiful specimen of this perfect Spanish type. She was clean and neat in her person, though her clothes were of the coarsest kind. Her gown, made of the light gray flannel or frieze manufactured in the mountains where she lived, was crossed upon her bosom and extended up to her neck. Her hair, as black as jet, was neatly parted on her forehead, and hung in careless folds down her back. She had neither shoes nor

stockings, and her dress did not come down to within seven or eight inches of her feet. She wore no shawl, which is common in the district, about her neck. She held her head as erect as a startled fawn. Her hands were clasped in an attitude of wild supplication, and the symmetry of her form was enhanced by the unusual addition of a leather strap buckled around her waist, which, though neither new nor ornamental in itself, had the effect of showing off her naturally beautiful figure to the best advantage.

The moment she appeared from behind the holly-bush, she commenced her oration. And, talking with a volubility and amount of action which it would be impossible to describe, her features became animated, and the blood mounted to her cheeks. In truth, I have rarely seen so beautiful and so natural a girl. I think she knew she was a beauty, and had "chanced" a little of the success of her visit upon that score, as well as upon my "goodness;" but there was no vanity or coquetry in her manner—she was perfectly natural and simple, and, as regards the knowledge of her beauty, so intelligent a girl as she was could not possibly look at her reflection in one of her own dark mountain lakes, and not see that she was different from her neighbors.

She had watched my countenance with the quickness of an Irish peasant, during the whole time she was speaking; and in fact I felt sure she had prolonged her statement for that sole purpose, in order to form an estimate of her success, or vary her line of advance according as circumstances revealed themselves. I saw this perfectly at the time; but my interest in her vivacious courage was so great, and my admiration of her beauty so impossible to conceal, that she saw in a moment, though I had not yet spoken a word, that she had won her point.

"Ah! well I knew your honor had a good and kind heart within you," said she, coming forward with graceful animation and under cover of her well-turned flattery. "And now, maybe I'd never have another opportunity, and oh! just listen to me till I tell you what I have to say, for mine is a sore, sore sorrow."

In a moment her whole countenance—almost her form, had changed. Her courage—some of which she had evidently derived from her beauty—seemed to have departed. Tears filled her eyes as she looked down upon the ground, and even her form seemed to lose many inches of its height. I could scarcely have thought that the same human being was before me, as she now stood about to tell her tale of sorrow.

"What is your name?" I asked, "and where do you live?"

"Mary Shea is my name," said she, "that is, my maiden name, and indeed for that matter I am not married yet."

"Married!" I exclaimed, "why you seem scarcely seventeen years of age."

"True for you," replied she, "you guessed it very nigh, as I'll only be seventeen next Shrove-tide."

"And what is your case? what do you want me to do?"

"I'll tell your honor that," replied she, resuming in a moment a portion of her previous animation. "What I want your honor to do is, to put down Eugene's name in the books, as tenant for the little place I have up in the mountain."

"And who is Eugene? and how came you to have a little place of your own, and you so young as you are?"

"I'll tell your honor all about it," she replied: "the way of it all was this:" and again in a moment her countenance changed, her eye lids drooped, her form seemed to lose its height, and, with a little hesitation as to where she should begin, she commenced her tale of woe "The way of it all was this; your honor was not here in the 'hungry year' (a term frequently used amongst the peasantry to describe the famine); but them was terrible times. I was only a little slip of a girl then—and sure for that matter I'm not much more this minute. But my father had a little place up in the mountains, the same as what I was now talking about. Well, you see, he was an ould man, and my mother was sickly, and they had no other child but me, and the place was very small, and, when the potatoes blackened, sure they had no one but God to look to. 'Father,' says I, 'I fear ye'll die, and mother too, if ye don't get something to ate.' 'True for ye, child,' says father, 'but where are we to get it? the great God has rotted the potatoes in the ground, and what other support had we all, and sure the neighbors are as bad off as we are.' Mother said nothing: she looked at father and me, she kissed me once or twice, as if to wish me good-by; and when I got up in the morning, I found her sitting in her clothes beside

the fire quite dead and stiff—not a month after the potatoes had blackened.

"Well, ye see we lived far up in the mountains, and no meal or any thing could be got there, except what I brought myself—and it was ten long miles from Kenmare. 'But still,' says I, 'I won't let father die, if I can help it!' So we had a few hives of honey which the gentlemen liked, because the bees made it all on the heather; and I used to slip over to Kenmare, now and then, with a hive, and bring back a little meal to father—we had no cow, as the place was too small to rear one. And I won't tell your honor a lie when I say that sorra ha'porth we had to live on except just the few hives of honey; and I knew when they were out, and I had no money to buy meal, we might just lie down and die. However, I said nothing to father about this, for I was only a slip of a girl; but I thought it for all that.

"Well, sure enough, after a time the honey was all sold, and I smothered the last bee I had—though in troth I was sorry to do so, as I had reared them all myself, and I think they knew me, as they never once stung me, though I used to sit close to the hive watching them. However, I knew well it was better for them to die than father, so I had to smother them; and I went down to Kenmare with a sorrowful heart, and got 15s. for the hive. Well, with that I fed father and myself for another weary month: and, when the meal was out, father says to me—'Mary dear, it's no use striving any longer against the hunger. I can't stand it. I'm weak and faint, and not able to go out to the public works, and I might as well die in the house as on the roads; and now mind, Mary dear, when I die, bury me beside your mother in the garden, and don't be making any noise about it—calling a wake or a funeral, for all has enough to do these hard times for themselves.' 'Oh father dear, don't talk that way,' says I, 'I'll just go out and see if I can't get something that will keep the life in ye yet.' So father said nothing, but just lay down on the bed, as if to wait till I came home. Well, I had some strength and spirit in me yet. And, as Eugene and I had known each other since we were little children, I thought I would just go to him and see if he could help me. But when I went to his house he was far away on the public works. So I had no more heart nor strength to go any farther, and I had enough to do to get home. But oh! sorrow came heavy on me then: for, when I called on father as I came in to ask him if God had sent him any food, he did not answer; and when I came to his bed, and put my hand upon his forehead, I found that he was dead and cold, and I was left alone in the world."

Here the poor girl's voice failed; and, commencing to weep bitterly, she turned her head away. I found the tears rising in my own eyes too, but, endeavoring to turn her thoughts from this sad scene, I said—

"You have mentioned Eugene once or twice—who is Eugene?"

She dried her eyes in a moment; and, resuming the natural vivacity of her manner, she called aloud to some one who was evidently near at hand—

"Eugene! where are you, Eugene? I wouldn't wonder if he was here this minute!"

And, truly enough, he was; for, slowly emerging from the same holly-bush where I had observed the young damsel's eyes in the first instance, came a tall, good-looking youth, clean and fair, with a cheek as smooth and free from beard as a woman's. He was about nineteen or twenty years of age, and as bashful as a youth detected under such circumstances—though she had evidently hid him there herself—could be.

"Don't be afeared, Eugene," cried the damsel—"don't be afeared. The gentleman isn't angry. Come and spake to him this minute.—He is shy, your honor," said she—turning to me in a conciliatory voice, as if excusing and patronizing her lover, over whom she evidently considered she had a great advantage in facility of speech and general knowledge of the world—"he is shy, and doesn't know how to spake to a gentleman; and I hope you'll excuse him; but he is a good kind boy for all that, and well able to become a tenant for the little place, if you will only put his name in the book."

"Well but," I urged, "if I put his name down in the book, he will be the tenant and not you; and how would that answer your purpose?"

"Oh, sure your honor, it would be all the same; we would get married at once, and we would have the little place between us, as I feel lonesome in it all by myself."

"How large is the little place?" inquired I.

"Well, for that matter, it is big enough," she replied; "but indeed it is not good for much, as it's able to feed nothing but the bees. And troth, I don't know where they find any thing to gather except in autumn, when the blossom comes upon the heather."

"What is the value of the place?" asked I.

"Well, indeed, it is not much. The late agent said it was good value, little cabin and all, for 7s. 6d. a year, and the rent was never raised since, and we made a few perches of potato-garden near the house."

"And so you and Eugene really want to marry and set up house upon a place only worth 7s. 6d. a year, cabin, mountain-land, garden, and all?"

"Well, indeed, your honor, I don't see what better we could do. You see Eugene and I have known each other a long time now, and all the neighbors knows we loves each other very much—and why wouldn't I love him, poor boy, when it was himself that saved my life?"

"How did he save your life?" I asked.

"Well, you see, I was telling you all about it," she resumed, "when you asked for Eugene, and I had to present him to your honor. But, shure enough, it was Eugene, and no one else, that saved my life, that night I was telling you of when father died. I found him cold and stiff in the bed when I came home; and I had nothing in the house myself—no meal, nor bread, nor potatoes, nor a ha'porth; so I just sat down on the bedside near him, and—God forgive me!—I prayed that He would take me too; for I was helpless and sorrowful, and weak and down-hearted, with the hunger. And then I began to cry; and I thought of mother, how she had died, and how father was dead, and no one to bury him. 'And,' thinks I, 'if I die too, the cabin will make a decent little grave over us all, and no one will know any thing about it!' So I was crying on, thinking of all these things, and wondering how it all came about, when I heard a footstep at the door, and I guessed at once it was Eugene's. So he never said a word to me at first, but he sat himself down beside me. And, after a little, he says, 'What is it, Mary dear?' 'Oh, Eugene,' says I, 'mother is dead, and now father is dead: there he is before you, and I'm going to die too, for I'm broken-hearted, and have nothing to eat.' 'Eat this,' says Eugene, and he pulled an elegant loaf out of his pocket—'I guessed ye came up to look for me to-day; and, when I came home from the works, and mother gave me my supper, I just put it in my pocket, as I wasn't hungry myself, and came off with it to you. So eat it, Mary dear; for I couldn't eat it if a basketful of bread was before me!' Well, I knew the poor boy had stinted himself to give it to me; but I was well-nigh gone, so I just gave him a loving look, and says I, 'Eugene dear, I know well how it is; but I'll eat it for all that for your sake, and for fear I'd die before your face.' And so I did. 'And now, Mary,' says he, 'come home with me, and mother will take care of you for a bit; and, in the morning, I'll come out myself and bury father for you.' And so he did—the brave boy that he is, shy as he looks before your honor now. And we dug the grave between us, and put father into it, just as he was—for we had no coffin—where would we get one that year? and we laid him beside mother. And when the great day comes, sure they'll both rise together as well as if they were in a coffin of gold!"

Again she began to weep; but it was of short continuance this time.

"And now won't you put Eugene's name in the book? and we'll go live there again, for it's hard to keep him away, and he is always pressing me to go with him to the priest. And we have put a new coat of thatch upon the little cabin, and maybe God would be good to us, and the bees would thrive, and the hungry year may never come on us again."

It was hard to resist such an appeal; especially when so easy an act would make a young and attached couple happy. But when I reflected upon the prospects in life upon which they were about to marry—nothing but a few acres of worthless heather, the cabin and all the land attached worth only 7s. 6d. a year, and fit for nothing but to feed bees—I felt that, in granting her request, I was only perpetuating the very system which had killed her father and mother; and, if extended now again, could not possibly lead to any thing but the utmost want and misery. To think of this noble youth and innocent and lovely maiden—such a handsome, loving couple as they were—squatting on this miserable plot of irreclaimable mountain-side! I could not bear to think of it, so I resolved, if I could, to save them from so unworthy a fate.

"Well, Mary, I have heard all you have to say, and I would gladly do any thing in my power to serve you and Eugene,\* but I cannot bear the thought of a handsome girl like you, and a fine manly boy like him, settling down for life on this miserable patch on the side of a barren mountain. I am thinking it would be far better to try your fortune in America together, and go out like the other emigrants, so many of whom were pressing to get their names down to-day."

Mary was silent for a little. At last she said—

"Well, your honor, I often thought it would be better, sure enough, to try our fortune in America, than to marry and settle on that small patch of barren land where my little place is; but I couldn't bear to think of going out on charity as a pauper. I never yet got poor-relief from the workhouse; and I wouldn't wish to go to America with the likes of the emigrants your honor is now sending out."

"I understand your scruples," I replied, "so I will propose another plan. What do you think if Eugene were to go out first—just for one year—and see whether the country would suit you and him? Let him return at the end of the year; and if he does not like America, then I will put his name in the books as tenant for your own little place, or probably I shall be able to give you and him a better farm by that time."

"I would be loth to part with him for a whole long year," said Mary, looking lovingly upon the bashful Eugene; "but still I think it might be the best way after all; for, no doubt, it is a poor place to settle on. But Eugene has no money to go out with, and I have little or none to help him, and he couldn't go without that."

"He shall not fail for want of funds; I will lend him the money for his voyage. If he return rich, he will repay me; if not, why it can't be helped."

"Your honor is very good," replied she, looking mournfully at Eugene; "but what will I do without him; and where will I go while he is away?"

"You can stay at mother's, dear, while I am away," broke in Eugene, who seemed suddenly to awake to an energy he had not before exhibited. "You well know she always loved you as a daughter, and she will care for you for my sake as well as for your own."

"I believe your honor's right," said Mary, turning to me; "let him go and try his fortune for one year; but mind," she added, as she looked toward the lad—"mind, Eugene, you must swear to me on the Book you will come back—rich or poor, I don't care which—within the one year."

"I will swear it to you freely," replied Eugene, who seemed suddenly to find his tongue and all his other energies at the prospect of such an opening.

"And will your honor promise, on the word of a gentleman, to give us back the little place, or get us another better one when he returns, if he won't take me out with him again?" asked Mary, with an appealing look.

"Indeed I will; I faithfully promise it, if I am alive and here."

"Well, then, let it be so," said the weeping Mary; "and now the sooner the better. When will your honor give him the money that he may go at once?"

"To-morrow morning. He shall also have a new suit of clothes, as fast as the tailor can make them, and I have no doubt he will get into immediate employment."

Mary looked at her intended husband, and at once perceived that a man's energy and courage had suddenly risen within him. He was no longer a sheepish boy, patronized and brought forward by her; and he took upon himself the unaccustomed task of comforting and patronizing her.

"Mary dear, don't fret; as sure as the sun is in the heaven, I'll come back; I know I will, and this will be the last parting we will ever have. The gentleman has advised us for our good. The barren lot on the mountain-side is no place for the likes of you and me to settle. I'll go seek my fortune in America; and, please God, I'll surely succeed; and then I'll come back for my own darlin', and take her out along with me. For God's sake, master, let us be quick; for I dar'n't rest, or think of leaving Mary, or maybe I couldn't go out at all."

Mary threw her arms about Eugene's neck, and—utterly regardless of my presence—sobbed and wept like a little child. Her patronizing

air was utterly gone, and she addressed him as a lover who had proved himself worthy of her affections.

"Eugene," she said, "I know well I need not fear for your love if you were ten thousand miles away. Ye have proved it too often for me to doubt it for a moment now. Go, and God be with you; but—mind you come back within the year, *whether ye be rich or whether ye be poor*—if rich, ye will be welcome, and if poor, ye will then be doubly welcome to your own darlin' Mary. *Never forget that.*"

She then turned to me, and, holding out her hand as a countess might have done, she continued:

"Thank your honor much for your kindness; I'll never forget it, either in this world or the next."

In a few days Eugene appeared before me, clad in a new and comfortable suit.

I gave him his passage-money, and a couple of pounds over, that he might be able to go up the country, and look for employment at once. He thanked me in a manly, open way, and departed.

My time and attention were so much occupied with the onerous duties in which I was then engaged, that though I often thought of Mary and her lover, yet I never had an opportunity of making special inquiries about her; but, one day, she sought me again as I was walking in the same grounds; and, coming up to me with a countenance beaming with pleasure, she showed me a letter from Eugene. It was not long, nor what most people would call very interesting; but he told her he was in full employment with a good and kind man; that he had already saved seven pounds out of his earnings, and he hoped, before very long, to come back and claim his prize, and carry his darling Mary off to a far home he was even then preparing for her. This was about six or seven months after he left, and she had remained sometimes in her "own little place," as she called it, and sometimes with his mother, ever since.

About five months after the last interview, I was walking alone along the sea-shore at Kenmare, when I was again waylaid by the handsome Spanish beauty; but this time she was accompanied by a young man. She looked grave, though happy, as she walked lovingly by his side, and her patronizing ways had altogether departed from her. I looked carefully at the young man. He was tall and strong; his beard was massive, and reached almost to his chest; his face was handsome, but sunburnt and weather-beaten; and his whole appearance was as little like her lover Eugene as it was possible for it to be.

I stood still as the pair approached me, looking intently from one to the other. Mary and the man came quite close up to me, and—as neither of them addressed me—I was the first to speak.

"How is this, Mary?" said I, "and who is this man who accompanies you? You surely do not mean to say you have cast off Eugene, and taken up with another man?"

Mary leaped nearly a foot from the ground as I said so. "I knew your honor wouldn't know him!" cried she in a sudden ecstacy of joy. "Why this is Eugene himself! Sure didn't he deceive me when he first came into the cabin, and why would your honor know him? Look at him now, and tell me if he is not grown a real man in earnest. Turn round, Eugene, and show yourself;" and, assuming her old patronizing way for a moment, she turned him round and round for me to look at and admire, while he submitted with a loving, tender look of admiration at his bride.

"And so this is indeed Eugene come back," I exclaimed, "and such a fine, manly-looking fellow too. I hope you have prospered, Eugene, and that you will now take out Mary to a new and happy home far better and richer than her little place on the barren mountain."

Eugene was about to reply, when Mary leaped up, and caught him round the neck with her arms.

"Oh, Eugene!" cried she—almost in hysterics between joy and anxiety—"take me away with you soon, oh take me away, we cannot go too soon to please me!" Then—turning rapidly to me—she said, in a joyous and altered voice—

"He has got a fine place of his own now, and twenty acres of good land, and a grand wooden house, in which he says I can live as comfortable as any lady. Oh, Eugene darling," cried she, turning to him again, "take me away—take me away, and let us go to our new home, and never know sorrow or hunger more!"

She burst into tears, and, clinging to his neck, kissed him over and over again, till he gently took her in his arms, and placed her sitting—still scabbing like a child—on a bank of grass close by.

\* "Eugene" is a common Christian name amongst the peasantry in that part of the country, probably of Spanish origin.

"Sir," said he, "I have to thank you for your kindness. I have brought back with me the money you lent me, and am now ready to repay you. I have a neat place to bring Mary to, and all reasonable comforts for her. I could have made it better, had I waited another year; but I promised in your presence not to let more than one year pass without returning, whether I came rich or poor. I have come back according to my promise. If not rich, at least with enough to give her plenty to eat, and a warm, comfortable home; and I hope soon to make it better. To-morrow we go to Cork: we are to be married there. The next day we sail for the West. May God bless you, sir; I will never forget your kindness." And he placed his passage-money in my hand.

Mary sat listening while he spoke, sobbing and crying all the while. He lifted her gently up. She seized my hand and kissed it, covering it with her tears. Then suddenly smiling, while the large drops trembled in her eyes, she gave me one grateful and happy look, and left the sea-shore with her lover.

## SKETCHES OF EARLY LIFE IN BOSTON.

### No. I.

#### HOW THERE CAME TO BE SUCH A PLACE AS BOSTON.

LONDON, August 31, 1629. The great Buckingham, murdered in the cause of royalty, is buried to-day with pomp and circumstance in Westminster Abbey. Funeral bells are clanging, muffled drums are rolling, solemn trumpets are wailing, sable plumes are nodding, while the long procession creeps through the streets of the great city to the venerable church by the Thames, where the bones of the illustrious dead are to be laid away in the darkness. A mournful day, perhaps, to a little circle of noble relatives and friends; but a holiday to the populace, who know no difference between a splendid funeral like this and a coronation. It is enough for them that business is suspended, and a gorgeous spectacle exhibited; but whether a young prince comes to the crown, or an old king is buried, they consider as a matter comparatively unimportant.

While this pageant is going on, some ten or twenty men have been deliberating all day upon a matter, of little interest at the time to any but themselves, but which is destined to affect the world, ages after all the Buckinghams and Stuarts have passed into oblivion. They have been in session for two long days, and now, as night draws near, they have reached their final decision. Candles are lighted, the parchment is laid upon the table, and one by one these men append their names to a document—you may see it to-day in the archives of Massachusetts, yellow and worn, and the ink almost faded out—by which the patent and government of the Massachusetts Bay Company are transferred to New England, with the understanding that the members of the company will also transport themselves and their families thither.

Thus far this has been known only as a trading association, and, when they came together, their talk was of fisheries, beavers, and the profits that would probably be derived from their investments over the sea; and in the inventory of articles to be sent to the colony we read of "all sorts of seed-grain, stones of all sorts of fruits, saffron-heads, madder-roots, currant-plants, quince-kernels, liquorice-seed, tame-turkeys," and so on. In fitting out the ship *Talbot*—calculated to carry a hundred passengers and thirty-five mariners, and to make her voyage in about three months—there are provided "six tons of water, forty-five tons of beer, one cask of Malaga, one of Canary, and twenty gallons of distilled liquors."

Applications have been made from time to time by various classes of persons for a free passage to the new settlement in America: as, for instance, Mr. John Betts urges the somewhat indefinite claim that "he is able to discover divers things for the good and advancement of the plantation;" one Mr. Gardner is represented as "an able and expert man in divers faculties;" a French physician "gives good commendation both of his sufficiency and of his godly life and conversation." In the

records of the company there are three professions mentioned, the members of which are to be specially encouraged to emigrate to New England, and identify their interests with those of the colony—"vine-dressers, men skilful in making pitch, and ministers."

But there were other matters working in the mind and heart of the members of the Massachusetts Bay Company, besides those mentioned in the patent, and there were reasons which led to the decision reached on the 31st of August, that are alluded to very vaguely in the resolutions passed that day. It was not merely to raise madder—poor returns those roots must have yielded in our cold soil—and manufacture pitch, that they determined to expatriate themselves and take up their abode in a foreign land. *What* their purpose was, we shall find out after they have arrived on these shores; what *God's* purpose was in sending them here, we shall know only after the lapse of generations.

The winter is passed in making the necessary preparations for their expedition, and in the month of March a fleet of eleven sail, with seven hundred souls on board, was gathered in the harbor of Southampton and elsewhere, waiting for a favorable wind. Mr. Winthrop and other leading men embarked on board the *Arbella*, and in the cabin of this ship drew up and signed a touching and affectionate farewell to "their brethren in and of the Church of England," from which they had not as yet separated, asking their sympathy and prayers, "as those whom God had placed nearest His throne of mercy."

The journals kept by the voyagers are not very copious or prolific in incident, but they are sunny and cheerful; in fine weather, we are told how "the sailors played wag with the children;" Mr. Winthrop writes home to his wife in England: "Our boys slept as soundly at night under their rug as they ever did in Groton;" and at last, in the beautiful month of June, they came in sight of Cape Ann and the Isle of Shoals, and found themselves surrounded by little shallops which had put out from the shore to meet them. By the 6th of July, the eleven ships had all arrived safely in Massachusetts Bay, and the new-comers established themselves at various points; "they who had health to labor fell to building;" but sickness and death soon began to make sad inroads upon their ranks, and not less than a hundred of the fainthearted took the first opportunity to return to England. "And glad we were," says the historian of the times, "to be rid of them."

One man, however, who seems to have been in remarkably good spirits, relieves himself in the following extraordinary effusion: "Whiles our houses were building, I did endeavour to make a survey of the country. The more I looked, the more I liked it; and, when I had more seriously considered of the beauty of the place, with all her fair endowments, I did not think that in all the known world it could be paralleled. For so many goodly groups of trees; dainty fine round rising hillocks; delicate fair large plains, sweet crystal fountains, and clear running streams that turn in fine meanders through the meads, making so sweet a murmuring noise to hear, as would ever lull the senses with delight asleep, so pleasantly do they glide upon the pebble-stones, jetting most jocundly when they do meet; and hand in hand run down to Neptune's court, which they owe to him as sovereign lord of all the springs: which made the land to me seem paradise; for in mine eye, 'twas Nature's masterpiece: her chiefest magazine of all, where lives her store: if this land be not rich, then is the whole world poor!"

Truth obliges us to add that this poetical gentleman, who went rollicking about the country while others were at work building houses, proved to be a very uncomfortable member of society, and gave more trouble to the colonists than any other person within their jurisdiction.

The first meeting of the company after their arrival in America was held at Charlestown. Opposite to this place, on the south side of the river, lay a peninsula, called by the Eng-

lish *Trimountain*, from the three hills which looked in the distance like separate islands, and by the Indians *Shawmut*, or, a spring of water. The only inhabitant of this spot was the Rev. Mr. Blaxton, a clergyman of the Church of England, who, dissatisfied with the turn things were taking at home, had betaken himself to the wilderness, that he might do and think as he pleased. Attracted mainly by the superior quality of the springs of water, the company enter into negotiations with Mr. Blaxton for permission to occupy a portion of the land, to which he courteously assents. After a while, finding his freedom somewhat straitened by his new neighbors, he decides to sell the whole peninsula to these settlers, which he does for the sum of thirty pounds, and betakes himself to the banks of what is now known as the Blackstone River, "having," as he remarked, "escaped from the hands of the Lord Bishops in England, only to fall into the hands of the Lord Brethren."

On the 7th of September, 1630, it was ordered "that Trimountain shall be called Boston."

This is, in brief, the way in which there came to be such a place as Boston. Two hundred and thirty years ago, it was a little village that lay nestled near the water, under the shadow of a green hill. A single ferry-boat connected the almost insulated town with the adjoining country. Warders kept watch all night on the summits of the three wooded elevations that towered above the peninsula, ready to light the beacons and discharge the "loud-babbling guns," whenever the wild whoop of the Indian might break the stillness. The cattle grazed, and the corn grew, and the forest-trees moaned, all around the little village at the foot of the hill. Once or twice in a month, an English bark or a French pinnace dropped her anchor in the quiet bay, and nearly three-quarters of a century elapse before a post-office is opened, or a mail runs, or a newspaper is published. In 1633, the taxation of Boston and seven adjacent towns amounted to only ninety-four pounds.

What Boston is to-day, who does not know? *Is it not written?* Who is not familiar with the names of her statesmen and journalists and philosophers and poets and novelists and historians? Who has not heard some of the great divines of Boston preach, or some of her great lawyers plead, or some of her great lecturers discourse, or some of her great orators declaim? What region of the land is there that has not felt their influence? Who has not heard of her great physicians, her men of science, and her princely merchants? What great societies have originated there; what reforms have been started there; what new thoughts she has given to the world, and what noble institutions she has established!

Who can have failed to hear of "Boston Common," with its aged elm, last survivor of the primeval forest, now kept from falling to pieces by iron clamps and rods, its beauty and grace well-nigh departed; and its venerable "frog-pond," from which no croak of frog has issued for many a year—nothing but a shallow paved bowl to-day, which the boys could drink dry in one or two summer afternoons, if it were not replenished by the tall fountain hard by?

Who has not heard of the State-House, with its somewhat adipose dome, which, of late years, has changed its tints at little intervals, now assuming a cold leaden hue, now a sober brown, and at last flaming into brilliant yellow, and which, it is proposed, some day, when the treasury is full and jobs are scarce, to cover all over with gold? Whose feet have not trod with awe the chamber where "The Great and General Court" solemnly deliberates—under the symbolical cod that swims in the upper firmament—and passes from year to year marvellous sumptuary laws, as the fathers did of old?

Whose blood has not kindled at mention of Faneuil Hall, "cradle of liberty," which, for nearly a century, has never failed to rock whenever the goddess of freedom has brought a new bantling into the world?

Who has not heard of Quincy Market, so massive and so clean, where every edible creature that walks, or flies, or swims,

or creeps, may be bought; and of the *old* State-House? Why has the ruthless hand of innovation been allowed to mar its ancient beauty? And of the Hancock House; alas, that it is now among the things that were?

Who has not heard of the stately warehouses of granite and marble, in which Boston stands absolutely unrivalled; and of her multitudinous railways, piercing the city at every point for more than one-half of her circumference?

Who can have failed to hear the "Great Organ," which thunders at high noon on every Wednesday and Saturday, for the delight of all who can afford to pay a moderate fee?

There are spots in the sun; there are sombre days in Italy; there may be weak points in the Constitution of the United States; and so a microscopic scrutiny might possibly disclose some defects even in Boston. Her streets are not very wide, and many of them are uncomfortably crooked. Most of the churches built there during the transition period of architecture, when honest old meeting-houses were replaced by Grecian banks and Gothic castles and gingerbread nondescripts—set apart for public worship—are as ugly as the perverse device of man could make them. Neither do her public statues do the city much honor. It is sad to think that, in the ages to come, Mr. Webster and Mr. Everett will be supposed to have resembled the bronze effigies which Boston now calls after their name. There may also be a little excess of self-respect occasionally manifested among the citizens of our modern Athens; and there certainly is manifested, at times, a tyranny of opinion and a severity of denunciation, under the guise of freedom and philanthropy and reform, that would be endured in few other places on the face of the earth; but, after all, it has been a great blessing to the nation that there came to be such a town as Boston.

And now we shall go on to see how the people conducted themselves there, two hundred years ago.

## HISTORICAL ART IN THE UNITED STATES.

TO speak of historical art in the United States is first to remark the want of it. But if we have instructed and sensitive minds, we shall be grateful for the absence of what is commonly understood as historical art. For we must believe that the painting of past historical events, which is to say, the representation of the destructive and aggrandizing action in war of great nations, does not offer us a civilizing spectacle; it rather justifies the rebuking sentence of Proudhon concerning the most boasted French historical pictures: "the fame of Horace Vernet is the accusation of a whole people."

Historical painting, like historical writing, before Voltaire, has been chiefly devoted to illustrate wars of conquest and the exploits of great families; it has ministered to the vanity of kings and depicted the trivial or striking actions of great men, but has ignored the mightiest agents of change and progress in the history of the human race; it has embodied the fictions of tradition, but turned its eyes from the crumbling, monumental facts of civilization. If it has perpetuated something of the splendor of combined human action, it has shown also the distressing tragedy of the immolation of the individual man. Versailles, the prodigal and corrupting monument of kingly ostentation, is the reproach of French art, and Horace Vernet is at the height of his power as an historical painter in Versailles. But Vernet, decorated by every crowned head of Europe, was, as a man and artist, essentially vulgar and unchristian. But unchristian as he is, he is without an idea, save that of action, which would have pleased a Greek of the age of Phidias. Only Frenchmen and brutal Americans can take pleasure in his harshly-colored, positive, and violent scenes of carnage, and of the marches and evolutions of great armies.

Ary Scheffer is at his lowest inspiration when making historical pictures for Louis Philippe, and it is but necessary to

look at Gérôme's work in Versailles to see an exhibition of the tame and vain service of art illustrating an aspect of official life.

When we say historical art, we mean such pictures as make the galleries of European capitals so tiresome, and Versailles so shocking to a lover of humanity. The historical pictures of the Luxembourg and of Versailles represent the average production of historical painters; and in art, as in poetry, the average production may possibly instruct, but it does not make the glory of a people.

Historical painting in America begins with Trumbull. It has mortified every true artist from his day to our own—that is, if artists have exercised their critical sense. American historical art is still mortifying to us, save in the example by Mr. Winslow Homer, the "Prisoners from the Front," which, in spite of its rough execution, and because of its truth and vigor, arrested the attention of polished Parisians, and fixed itself in the memory of so many of us as an actual and representative group out of our recent struggle, and which alone, of all our contemporary paintings, has the first claim to a place at Washington as a true bit of history, without animosity or partisanship, but frankly expressive of the elements in our Southern society that fomented and fed the rebellion against a beneficent and unaggressive Government. We must all regret that it is not permanently placed on the walls of the Capitol.

But historical art in America does not mean such undazzling and unpretending pictures as the "Prisoners from the Front;" it means rather the composed, the invented, the false, the conventional paintings which we shall not have the bad taste to mention, but which have won appropriations from Congress, and are the disgrace of the nation. Of such historical art we have too much; and yet, compared with the abundance of bad historical painting in France and England, we must be grateful that we have so little of it.

Historical art, under official patronage, has not given any thing comparable to the less imposing works silently solicited by nature and truth, which have made, and will always make, their own historic record through the artistic genius of a people.

Walk through the Continental galleries of historic art, and look for representations of the mightiest events of our modern civilization! You look in vain. You will meet fictitious representations of the Birth and Crucifixion of Jesus Christ; you will discover the painted inventions of the battles of the Crusaders; the odious succession of French exploits; episodes in the life of that great humbug Louis XIV.; pictures of that ruthless destroyer Napoleon I.; pictures of that cold-eyed usurper Napoleon III. But is this the noblest service of historical art? And should it oftenest give us the monotonous and tiresome delineations of the scourges of humanity? The past has something else to show us. The building of cathedrals; the invention of gunpowder; the invention of printing; the advent of the mail; the Declaration of Independence; the Emancipation Proclamation! Historical painting is inadequate to embody the significance of these subjects, and yet they are the great historic facts of mightiest meaning.

Trumbull painted the "Signing of the Declaration of Independence," but it can hardly be called an impressive picture; it might be a conference of the Continental fathers for any other purpose. It is, strictly speaking, our most important example of American historical art up to our recent war. But it is historical art not on a level with its subject. The talent of the artist was inadequate, his training still more so. And what can an ordinary painter make out of historical events which do not occur under picturesque or tragic circumstances?

The only historical art we should be judicious in asking, is that which the contemporary genius leaves as its personal record of its personal experience. In this sense, great portraits of grand or infamous citizens; noble architecture; true landscapes: sincere paintings by any gifted artist—these shall make true historical art in the United States. Less than these

—which may be commissioned by bought committees—may come into our public halls at the solicitations of political representatives, ignorant of the character and service of art. Of such are the humiliating pictures at the Capitol at Washington, of which we can only say, they are on a level with the artless spirits of our politicians.

No; we cannot ask for historical art in America as it is commonly understood. Give us art that shall become historical; not art that is intended to be so. Doubtless, that in proportion to the excellence of the painter's work, it will survive as the cherished expression of the artistic genius of the period in which it was produced. But any thing so impressive as Gérôme's "Cæsar," or splendid as Couture's "Romains de la Décadence," we shall not produce, for the materials of such impressive and splendid historical art are wanting. The assassination of the good Lincoln offers no picturesque and beautiful adjuncts. It is a death profoundly shocking, but devoid of the dignity of action, and without the majestic situation of the fall of the august Roman in the senate-chamber, at the feet of Pompey's statue. Cæsar fell amid chaste and beautiful architectural forms, in a vast space, and among figures clad in flowing draperies. Without either the picturesque or beautiful, the tragic is unsuited to painting, however much it may impress in a narrative.

We must abandon the pretension to historical painting as it is commonly understood. It is fatal enough to talent in France, in spite of a few masterpieces. The finest pictures are not those which are painted to represent historical events, to which the frenzy of the hour gives a false splendor and an exaggerated importance. The finest pictures are those which represent Nature, or the personal sentiment of the painter uncorrupted by the bad taste of his time. Historical art is the best *contemporary* art; it is portrait-painting at its highest level; it is *genre* painting; it is landscape-painting; it is the bust of Vitellius in Rome; it is the statue of Lorenzo de Medici in Florence; it is the portrait of the wife of Francesco del Giocondo in Paris. In our own country it is made by Stuart's and Trumbull's, by Allston's and Inman's heads; by Copley's, by Malbone's. Tomorrow it will be the best work left by the best painters and sculptors of to-day. Any other historical art in our country must be historical fiction and conventional misrepresentation, imposing upon the ignorant and unreflecting, and, at best, no more than a composed, a studied, and lifeless piece of pictorial art, oftenest exciting the scorn of critics, and making the judicious grieve.

If no other cause but the want of the means of study could be cited, it would be sufficient to justify the prediction of a poor form of historical painting in this country; for historical painting is dependent upon museums, trained models, and the prolonged discipline, which is exacted in the *École des Beaux-Arts* in Paris. But the *École des Beaux-Arts* has not made the glory of French art; therefore we can expect a noble and beautiful form of art without museums, trained models, and the *École des Beaux-Arts*. But we cannot expect a comprehensive and adequate historical art without the museums, monuments, and *retrospective* genius of Europe.

In France, with all its historical accumulations, among the vast number of historical pictures there are but few veritable and satisfactory examples of historical painting. Gérôme's Roman subjects, Müller's "Conciergerie during the Reign of Terror," Delaroche's paintings illustrative of English history, Delacroix's "Barricade," are the most striking. If all the artistic genius of France, disciplined by study, and urged by a passion for the past, has but seldom fulfilled the high conditions of noble and impressive historical pictures, what fatuity for us to expect our painters to produce great examples of historical art! The American artist must content himself with his contemporaries; the American citizen must believe that only his current achievements are within the reach of the pictorial genius of his fellow-countrymen.

## THE WOMAN OF BUSINESS.

BY THE AUTHOR OF "THE BACHELOR OF THE ALBANY."

## CHAPTER I.—UP-HILL WORK.

"THERE are just two objections to your plan," said Woodville to his companion, in the *coupé* of the diligence, as it rolled and rumbled along the Simplon road, soon after leaving Domo d'Ossola, advancing toward the Lago Maggiore; "one is the unconscionable hour at which we must start to accomplish it; the other is the appalling length of the walk."

"Trust me," replied the more energetic Alexander, smiling—indeed, almost laughing outright—at the strong expressions his friend had employed; "you will be rewarded a thousandfold; the prospect from the summit of Montarone is, by all accounts, one of the finest on the south side of the Alps. We shall not only look down upon the lake of Orta, which so few English tourists visit, but we shall see Monte Rosa in all its glory by sunrise, and a wonderful range of mountains into the bargain. As to fatigue, that is a difficulty easily got over—you can take a mule or a donkey, and then you will have six legs against my two."

"If I surrender," said the less robust, or less adventurous, of the travellers, "it must be on two conditions: first, that you guarantee me a fine day—"

"That I do," said Alexander, intrepidly.

"And, in the next place, you must promise me two clear days' halt at Orta."

Alexander smiled and shook his head, demurring to the second clause. He felt quite sure one day would suffice for all the recruiting necessary after an excursion, which, to him, seemed a mere bagatelle. But Woodville would not abate a minute of the forty-eight hours, and, after some more discussion, his friend had no alternative but to yield.

"Ah, my friend," said the other, as soon as the point was settled, "I have neither your vigor nor your marvellous passion for up-hill work; you show it in every thing as well as in mountaineering."

"Your profession does not exact the same continuous labor as mine," said Alexander.

"You are mistaken there," said Woodville; "there is no success in painting any more than in law or any thing else, without the energy and toil in which you exult, and of which I am constitutionally incapable. With your force and courage, I feel that I could be a Titian. Even now, after the compact I have made with you, I almost doubt whether I shall be physically equal to keep my part of the engagement. What will you do if you fail to get me out of bed at three in the morning?"

"There will be nothing for it but oxen and wain-ropes," said Alexander.

"Yet, after all," continued the artist, "I am not a sluggard in principle. How often do I slug in bed on the long, bright summer mornings, speculating on the advantages of early rising, thinking of the wealth and distinction which men of your stirring habits are sure to win by their superior activity!"

"I love my pillow too," said his companion, "but I fancy I sleep more than you in a given time."

"Another proof of what I say: you sleep strenuously, as you do every thing. I have never seen you at your work, but I can imagine what you must be at business, from what I have seen of you on this tour, which is only your relaxation. You seem to me to have an unnatural appetite for exertion."

Alexander made a gesture of dissent.

"I know you have," continued Woodville; "as you fix your eye on that peak yonder, you are burning to scale it. Its crags encourage you as much as they dishearten me. Confess, now, if the diligence were to stop for half an hour, you would at least make the attempt."

Alexander neither admitted nor denied the impeachment; he merely said that, in his opinion, what seemed to be in some men a passion for toil was, in many cases, the mere result of a still more ardent passion for repose. "Would you know," he added, "what the object is at the bottom of all my plans, as far as I know myself—the *terminus*, to use a technical phrase, to all my aspirations? Do you see that old peasant at his cottage door, basking in the setting sun? He looks as if his

working-days were over; he is seated under a tree of his own planting, enjoying, literally eating, the fruit of his own industry. Well, I am not conscious of any more elevated motive than to attain to that poor husbandman's fortune, and, after some thirty or forty years of hard work at the bar, sit down like him and spend the evening of my days under my own fig-tree."

Woodville was so long without answering, that Alexander fancied that either his long speech, or the monotonous roll of the lumbering coach, helped by the advancing shadows of the hills, had lulled him to sleep; but, in fact, his sentimental friend was only musing with half-closed eyes in his corner on the beautiful though hackneyed image with which his companion had left off. He was also fixing in his memory, for the subject of a future sketch, the details of the rural picture to which his attention had been drawn. It had just the kind of interest to invite his indolent poetic pencil, a lovely bit of landscape, with a thought and touch of humanity in it. In such subjects Woodville's talent lay, and he might have been without a rival in it, had it not been for the half-mental, half-physical infirmity which always prevented him from doing his fine conceptions justice. He threw a charming thought upon canvas or into his sketch-book, and left it there; began a hundred subjects, and seldom finished one. He would paint one side of a face exquisitely, with an eye to haunt your memory forever, and leave the other for a future day, which never came. His studio in Paris, in a *quatrième* of the Faubourg St. Honoré, where he had lived for some years, and where Alexander first made his acquaintance, was a museum of abortive undertakings, evidence of as much genius as can exist without the power of sustained exertion. His very art was a proof of his instability, for he had not been brought up to it, but had dropped the medical profession for the pencil; he had actually taken a degree in medicine, but nothing annoyed him more than when a friend, in ignorance or thoughtlessness, called him Doctor, though every now and then he betrayed himself by the technical knowledge he displayed, particularly when he expatiated on his own complaints, of which he had a wonderful and amusing variety for a man who had never been seriously ill in his life. As to practice, he had as much now as ever he had, though he had only two patients: his old servant, Honorine, when she was rheumatic or dyspeptic, and himself. He dosed both patients freely; but, as his views had latterly been homœopathic, the harm his prescriptions did was probably only infinitesimal.

To return from this long digression. Woodville proved he was still awake by the one word with which he resumed the thread of the dialogue.

"Alone?" he said, looking full and interrogatively at his companion, who had, perhaps, been pursuing pretty much the same train of ideas, or, after so long a pause, he would have hardly understood that the question related to the fig-tree.

"Probably," said Alexander, with a smile; "the peasant was alone, as you must have observed."

"His better-half was probably within-doors," said Woodville; and, as he spoke, the wheels ceased to rumble, the bells to jingle, and the diligence stopped, amidst a jabbering of beggars and ostlers, in front of the principal inn of Baveno.

Now there is a hotel there of considerable pretensions; but its best inn was a poor one between twenty-five and thirty years ago, which was about the date of Frederick Alexander's first Continental tour. Italy, indeed, is not an eating country; she has made great advances in freedom, but in gastronomy she is behind the age. We must only hope that, when her political organization is complete, she will begin to cultivate the arts of the kitchen, and remember that she is as much the land of Apicius and Lucullus as of Cicero and Dante.

Our tourists had as sorry a supper served up to them as any cook in the whole Peninsula could have prepared; but, under the circumstances, this was no great trial of temper to either of the young men: the one was too fresh, and had too healthy an appetite, to turn up his nose, at the end of a long journey, at any dish that was eatable; while the other was too jaded and done up, after thirty-six hours' tumbling in the diligence, to care much for any thing but a bottle of wine and his pillow. Indeed, their project for next day was argument enough for roosting with the least possible delay, which poor Woodville did in half an hour after their arrival, leaving his friend at the table charged, as usual, with all the necessary arrangements for the morrow's expedition. It diverted Alexander, though he took care not

to show it, to observe the apprehension with which the nervous and vacillating artist evidently contemplated a march, which was no great feat, even in those days, when there was no Alpine Club in existence. Woodville made an unavailing attempt, before he retired, to reopen the question, suggesting the propriety of quietly circumnavigating the Lago Maggiore before they left its shores, but Alexander was as steady as a rock to the programme that had been arranged. They were to return to the Lago Maggiore by way of Arona, and from thence take all the lakes in order.

Left to himself, the young barrister (he was in about his three-and-twentieth year, two or three years Woodville's junior) first finished his supper, even clearing off two plates of walnuts and dry biscuits, which had probably been destined to do duty for the whole of the touring season. Then he hired a guide, with two donkeys—one for his comrade, one for the luggage; after which he called for the bill, settled it while he was undressing, and, in less than five minutes, was sound asleep, sleeping unconquerably through all the opposition which a sultry night in August, conspiring with legions of mosquitoes, offered to his rest. Poor Woodville, on the other hand, notwithstanding his extreme fatigue, would hardly have got an hour's sleep in the face of such a formidable league, had it not been for a phial of aconite which he had always with him in his neat portable medicine-chest, that Alexander took to be the paint-box. In fact, the artist seemed to himself to have scarcely closed his eyes when he was startled by the matin song of the asses under his window, as they were led into the courtyard. He dozed again for a moment in the midst of this agreeable serenade; but it was short-lived bliss, for now came his ruthless companion tapping at his door, and thrice was the tap repeated, always *crescendo*, before Woodville realized its terrible significance. The third tap was accompanied with sounds still nearer and more appalling. A strong hand was laid gently on his shoulder, and a hollow voice, not without pity in it, accosted him with—

"Woodville, your hour is come!"

Alexander was humane enough to feel that he was almost acting the part of Abhorson in the play, when he requests "Master Barnardine to get up and be hanged."

But Woodville proved a man of his word, and the oxen and wain-ropes were not wanting, although the clocks of Baveno were only striking three as they left the hotel. The guide went first, leading the beast that carried the baggage; Woodville followed on his own animal, which really looked as if it had six legs, those of the rider being rather long, and almost touching the ground. The rear was brought up by the bold limb of the law. On one point he had been rather too bold:

in covenanting for the weather, he had gone a little too far. When they started, however, it was still too dark to read the signs of the sky; as they looked back over the lake, even the white terraces of the Isola Bella were scarcely distinguishable in the gray gloom, but the air was fresh and balmy, and had such a stimulating effect on Woodville that he soon began to forget his grievances, and, finding his seat tolerably easy at first, his spirits rose, and he felt even grateful to his friend for combating his *vis inertia*. The ascent was tedious, for the long-eared brutes had their inflexible regulation pace, beyond which, on the most favorable ground, a forest of cudgels would have failed to urge them; but it was so much the easier for the friends to chat. Alexander asked how the artist had got through the night. He had found his own bed clean and comfortable.

"The beds are often better than they look," said Woodville; "but it is not enough for me that a bed is clean; it ought to be, like Caesar's wife, not only clean, but above

suspicion. There may have been no jumpers in mine, but every thing about it suggested that there were; that was enough to put comfort out of the question."

"Don't we do those little jumpers injustice?" said Alexander: "we complain of finding them in our beds, yet where else should one expect to find them? A bed is their *habitat*, as naturalists call it; we go to them, they don't come to us."

"Happy man," cried Woodville, "who can make a joke of all the troubles of life; nothing fatigues you, or worries you, or bites you. If you were an Irish Catholic, you would think the Protestant Church a laughing matter; if you were an Italian, you would be as patient as Job under the Austrian dominion."

"No, no," said Alexander, warmly. "If I were an Irish Catholic,

or, indeed, if I were an Irish Protestant, I should never rest while the Church existed; if I were an Italian, I should never be contented while a German swaggered in the Peninsula."

They were in the middle of a discussion on the prospects of Italy, which, at that period, seemed hopelessly gloomy; when, happening at the top of a sharp rise to face about toward the quarter they came from, the lake, of which they had seen the whole expanse a few minutes before, had disappeared from their view. While they had been chatting, a dense mist, born of the heat of the previous day, had stolen a march on them; and, what was worse, it seemed to be climbing the hills as fast as themselves. Both looked blank, and Woodville reminded his companion of his unlucky guarantee. Alexander put the best face on it, and declared that these Italian mists were of no consequence—they were not like Scotch mists—and he called Woodville's attention to the brow of the mountain, which was perfectly clear. In five minutes they should reach it, and in three more the sun would be up in all his glory.

"Ah, false prophet!" cried the artist, when the five minutes were expired, and they stood indeed on the crown of Montarone; but it was like standing on a few square feet of rock in the midst of an ocean of vapor.

Still Alexander's faith was strong; the vapors would vanish as quick as they came, the might of the sun would disperse them as a justice does a mob with the Riot Act, and then—then they would see the grandest spectacle in Europe.

But the sun either refused to do his duty, or the mists were too rebellious; instead of dispersing, they became rapidly condensed into a fine rain, which soon made Woodville feel that, in imitating the early bird, he had brought on himself the fate of the earlier worm. Not even then did the spirits of his friend fail him; and, to keep Woodville from sinking entirely, he insisted (while loading him with all sorts of wraps) on detailing all that he would, could, and should have seen, only for the treachery of the day.

"There," he cried, pointing in one direction, "there is Rosa, the second mountain for sublimity in the Alps, scarcely second to Mont Blanc; I almost fancy I see his outlines; but, no, he is totally invisible. Far southward the cone of Monte Viso—follow my finger; not a bit of him to be seen either. Now carry your eye half round the horizon, northward, and you come to another giant—I forget his name—lost in the fog like his betters. Milan is yonder, as plain as I see you, only for this provoking revolution in the weather, which prevents one from seeing any thing. Orta must be just below us, but the fact is, we can see nothing."

"A good reason for not staying here any longer," said poor Woodville, who was all this time shuddering with cold on his donkey, but too dejected to check his friend's enthusiasm, which was certainly rather untimely.

To make matters worse, not only did the rain increase until it thoroughly drenched them—even Woodville through all his wraps—but they had not been descending long before the track they had been following was suddenly lost, and, when they attempted to confer with the guide, they were unable to understand his *patois*, but he was evidently as much bewildered as themselves; so, after groping about for some time, trying in different directions, there was nothing better to be done than to trust the asses, who had probably often made the same journey. The beasts, however, were not so well acquainted with the town of Orta as they were with another place, called Omegna, on the same lake, but distant from Orta by several miles. At Omegna, accordingly, our travellers arrived, early enough in the day, but in such a pickle as to make it necessary to stop many hours at a wretched cabaret, which could scarcely afford either a breakfast or fire to dry their clothes. The latter was the chief point, and, as soon as it was tolerably well effected, they hired a boat, which landed them late in the evening under the balcony of the Leone d'Oro, the only inn at that time in Orta.

In the Countess Guiccioli's recently-published "Recollections of Lord Byron" it is stated that the great poet left behind him, besides a journal of his fatal expedition to Greece, five unpublished cantos of "Don Juan;" and that Moore, who was Byron's literary executor, burned these cantos along with the journal, because they contained some violent attacks on English society.

## WHAT'S MY LOVE LIKE?

TELL me,—What's my love like?

A lily of the May,

That does not shun the kissing sun,

Yet keeps its dew all day?

Yes, and no;

Fond is she, and coy is she,

But—whisper low—

She is more than this to me,

So, no lily shall she be.

But tell me,—What's my love like?

A little, cooing dove,

Who feels your breast her safest nest—

A thing of fear and love?

Yes, and no;

Timid she, and tender she,

But—whisper low—

She is more than this to me,

So, no dove my love shall be.

O tell me,—What's my love like?

Perhaps a pearl of girls,

For whose sweet face the king would place

His crown upon her curls?

Yes, and no;

Worthy of a king is she,

But—whisper low—

She is more, and is for me,

So, no queen my dear will be.

## CRUSOES OF THE AIR.

A RECENT French work, translated and reproduced in America, gives an account of a pretended journey in a balloon across the Continent of Africa. It possesses a certain value in affording us a nearly complete *résumé* of African travel and discovery, and it describes the tribes, animals, and surface of the country with as much accuracy as we usually find in books of travel. The adventures of the aeronauts are varied, amusing, and only a little more wonderful than those that usually befall African travellers. The narrative exhibits all that attention to detail which makes De Foe's works so fascinating. The adventures have an air of plausibility, and even the very ingenious contrivances, described at length, by which the balloon rises or sinks at the will of the aeronauts, seem to the ordinary reader in every way practicable. There is a great charm in the idea of the journey, and the author has exhibited no little ingenuity in transferring to a new element those Crusoe-like adventures, for which all people at all times have so keen a relish. The party consists of three persons: one Dr. Ferguson, of the Royal Geographical Society, of great renown as a traveller; Dick Kennedy, his friend, an open, resolute, headstrong Scotchman, who is a great hunter and a mighty shot; and, lastly, Joe, a servant of Ferguson's, a devoted, whole-souled, incomparable fellow, who looks up to the doctor as the greatest man in the universe.

The expedition proves a triumphant one, and the balloon accomplishes all that the enthusiastic doctor had predicted. "With it," he would say, "every thing is possible; without it, I fall back into the dangers and difficulties as well as the natural obstacles that ordinarily attend such an expedition; with it, neither heat, nor torrents, nor tempests, nor the simoom, nor unhealthy climates, nor wild animals, nor savage men, are to

be feared! If I feel too hot, I can ascend; if too cold, I can come down. Should there be a mountain, I can pass over it; a precipice, I can sweep across it; a river, I can sail beyond it; a storm, I can rise away above it; a torrent, I can skim it like a bird! I can advance without fatigue, I can halt without need of repose! I can soar above the nascent cities! I can speed onward with the rapidity of a tornado, sometimes at the loftiest heights, sometimes only a hundred feet above the soil, while the map of Africa unrolls itself beneath my gaze in the great atlas of the world."

These new Crusoes undergo an abundance of adventure. In one of their halts they are attacked by the savages. In another, while anchored in a forest, the trees are set on fire by the natives. Another tribe lets loose upon them a great number of pigeons, each with its tail garnished with fire. They get becalmed in a desert, and nearly die of thirst. They kill a lion and a lioness with all the expertness of Gordon Cumming himself. We cannot give the space to recount all the extraordinary adventures that befell these novel travellers, but quote the following in full. Once having decided for a halt, their anchors, flung out from the car, were sweeping the excessively tall grass of an immense prairie:

"In truth, it was a charming excursion that they were making now—a veritable navigation on this green, almost transparent sea, gently undulating in the breath of the wind. The little car seemed to cleave the waves of verdure, and, from time to time, coveys of birds of magnificent plumage would rise fluttering from the tall herbage, and speed away with joyous cries. The anchors plunged into this lake of flowers, and traced a furrow that closed behind them, like the wake of a ship.

"All at once a sharp shock was felt—the anchor had caught in the fissure of some rock hidden in the high grass.

"We are fast!" exclaimed Joe.

"These words had scarcely been uttered when a shrill cry rang through the air, and the following phrases, mingled with exclamations, escaped from the lips of our travellers?

"What's that?"

"A strange cry!"

"Look! Why, we're moving!"

"The anchor has slipped!"

"No: it holds, and holds fast too!" said Joe, who was tugging at the rope.

"It's the rock, then, that's moving!"

"An immense rustling was noticed in the grass, and soon an elongated, winding shape was seen rising above it.

"A serpent!" shouted Joe.

"A serpent!" repeated Kennedy, handling his rifle.

"No," said the doctor, "it's an elephant's trunk!"

"An elephant, Samuel?"

"And, as Kennedy said this, he drew his rifle to his shoulder.

"Wait, Dick; wait!"

"That's a fact! The animal's towing us!"

"And in the right direction, Joe—in the right direction."

"The elephant was now making some headway, and soon reached a clearing where his whole body could be seen. By his gigantic size, the doctor recognized a male of a superb species. He had two whitish tusks, beautifully curved, and about eight feet in length; and in these the shanks of the anchor had firmly caught. The animal was vainly trying with his trunk to disengage himself from the rope that attached him to the car.

"Get up—go ahead, old fellow!" shouted Joe, with delight, doing his best to urge this rather novel team. "Here is a new style of travelling!—no more horses for me. An elephant, if you please!"

"But where is he taking us to?" said Kennedy, whose rifle itched in his grasp.

"He's taking us exactly to where we want to go, my dear Dick. A little patience!"

"Wig-a-more! wig-a-more! as the Scotch country folks say," shouted Joe, in high glee. "Gee-up! gee-up there!"

"The huge animal now broke into a very rapid gallop. He flung his trunk from side to side, and his monstrous bounds gave the car several rather heavy thumps. Meanwhile the doctor stood ready, hatchet in hand, to cut the rope, should need arise.

"But," said he, "we shall not give up our anchor until the last moment."

"This drive, with an elephant for the team, lasted about an hour and a half; yet the animal did not seem in the least fatigued. These immense creatures can go over a great deal of ground, and, from one day to another, are found at enormous distances from where they were last seen, like the whales, whose mass and speed they rival.

"In fact," said Joe, "it's a whale that we have harpooned; and we're only doing just what whalers do when out fishing."

"But a change in the nature of the ground compelled the doctor to vary his style of locomotion. A dense grove of *calmadores* was descried on the horizon, about three miles away, on the north of the prairie. So it became necessary to detach the balloon from its draught-animal at last.

"Kennedy was intrusted with the job of bringing the elephant to a halt. He drew his rifle to his shoulder, but his position was not favorable to a successful shot; so that the first ball fired flattened itself on the animal's skull, as it would have done against an iron plate. The creature did not seem in the least troubled by it; but, at the sound of the discharge, he had increased his speed, and now was going as fast as a horse at full gallop.

"The deuce!" ejaculated Kennedy.

"What a solid head!" commented Joe.

"We'll try some conical balls behind the shoulder-joint," said Kennedy, reloading his rifle with care. In another moment he fired.

"The animal gave a terrible cry, but went on faster than ever.

"Come," said Joe, taking aim with another gun, "I must help you, or we'll never end it." And now two balls penetrated the creature's side.

"The elephant halted, lifted his trunk, and resumed his run toward the wood with all his speed; he shook his huge head, and the blood began to gush from his wounds.

"Let us keep up our fire, Mr. Kennedy."

"And a continuous fire, too," urged the doctor, "for we are close on the woods."

"Ten shots more were discharged. The elephant made a fearful bound; the car and balloon cracked as though every thing were going to pieces, and the shock made the doctor drop his hatchet on the ground.

"The situation was thus rendered really very alarming; the anchor-rope, which had securely caught, could not be disengaged, nor could it yet be cut by the knives of our aeronauts, and the balloon was rushing headlong toward the wood, when the animal received a ball in the eye just as he lifted his head. On this he halted, faltered, his knees bent under him, and he uncovered his whole flank to the assaults of his enemies in the balloon.

"A bullet in his heart!" said Kennedy, discharging one last rifle-shot.

"The elephant uttered a long bellow of terror and agony, then raised himself up for a moment, twirling his trunk in the air, and finally fell with all his weight upon one of his tusks, which he broke off short. He was dead."

But, perhaps, the most original of their adventures was an attack by a dozen condors, the most formidable of birds. A battle with birds three thousand feet up in the air! Is not here a new incident for the sensational drama, or the sensational pictorial papers? Is there any thing quite like it in the whole range of romantic adventure?

"The condors flew around them in wide circles, their flight growing gradually closer and closer to the balloon. They swept through the air in rapid, fantastic curves, occasionally precipitating themselves headlong with the speed of a bullet, and then breaking their line of projection by an abrupt and daring angle.

"The doctor, much disquieted, resolved to ascend so as to escape this dangerous proximity. He therefore dilated the hydrogen in his balloon, and it rapidly rose.

"But the condors mounted with him, apparently determined not to part company.

"They seem to mean mischief," said the hunter, cocking his rifle.

"And, in fact, they were swooping nearer, and more than one came within fifty feet of them, as if defying the fire-arms.

"By George, I'm itching to let them have it!" exclaimed Kennedy.

"No, Dick; not now! Don't exasperate them needlessly. That would only be exciting them to attack us!"

"But I could soon settle those fellows!"

"You may think so, Dick. But you are wrong!"

"Why, we have a bullet for each of them!"

"And suppose that they were to attack the upper part of the balloon, what would you do? How would you get at them? Just imagine yourself in the presence of a troop of lions on the plain, or a school of sharks in the open ocean! For travellers in the air, this situation is just as dangerous."

"Are you speaking seriously, doctor?"

"Very seriously, Dick."

"Let us wait, then!"

"Wait! Hold yourself in readiness in case of an attack, but do not fire without my orders."

"The birds then collected at a short distance, yet so near that their naked necks, entirely bare of feathers, could be plainly seen, as they stretched them out with the effort of their cries, while their gristly crests, garnished with a comb and gills of deep violet, stood erect with rage. They were of the very largest size, their bodies being more than three feet in length, and the lower surface of their white wings glittering in the sunlight. They might well have been considered winged sharks, so striking was their resemblance to those ferocious rangers of the deep."

"They are following us!" said the doctor, as he saw them ascending with him, "and, mount as we may, they can fly still higher!"

"Well, what are we to do?" asked Kennedy.

The doctor made no answer.

"Listen, Samuel!" said the sportsman. "There are fourteen of those birds; we have seventeen shots at our disposal, if we discharge all our weapons. Have we not the means, then, to destroy them or disperse them? I will give a good account of some of them!"

"I have no doubt of your skill, Dick; I look upon all as dead that may come within range of your rifle, but I repeat that, if they attack the upper part of the balloon, you could not get a sight at them. They would tear the silk covering that sustains us, and we are three thousand feet up in the air!"

"At this moment, one of the ferocious birds darted right at the balloon, with outstretched beak and claws, ready to rend it with either or both."

"Fire! fire at once!" cried the doctor.

"He had scarcely ceased, ere the huge creature, stricken dead, dropped headlong, turning over and over in space as he fell."

"Kennedy had already grasped one of the two-barrelled fowling-pieces and Joe was taking aim with another."

"Frightened by the report, the condors drew back for a moment, but they almost instantly returned to the charge with extreme fury. Kennedy severed the head of one from its body with his first shot, and Joe broke the wing of another."

"Only eleven left," said he.

"Thereupon the birds changed their tactics, and by common consent soared above the balloon. Kennedy glanced at Ferguson. The latter, in spite of his imperturbability, grew pale. Then ensued a moment of terrifying silence. In the next they heard a harsh tearing noise, as of something rending the silk, and the car seemed to sink from beneath the feet of our three aeronauts."

"We are lost!" exclaimed Ferguson, glancing at the barometer, which was now swiftly rising.

"Over with the ballast!" he shouted, "over with it!"

And in a few seconds the last lumps of quartz had disappeared.

"We are still falling! Empty the water-tanks! Do you hear me, Joe? We are pitching into the lake!"

"Joe obeyed. The doctor leaned over and looked out. The lake seemed to come up toward him like a rising tide. Every object around grew rapidly in size while they were looking at it. The car was not two hundred feet from the surface of Lake Tchad."

"The provisions! the provisions!" cried the doctor.

"And the box containing them was launched into space."

"Their descent became less rapid, but the luckless aeronauts were still falling, and into the lake."

"Throw out something—something more!" cried the doctor.

"There is nothing more to throw!" was Kennedy's despairing response.

"Yes, there is!" called Joe, and with a wave of the hand he disappeared like a flash, over the edge of the car."

"Joe! Joe!" exclaimed the doctor, horror-stricken.

"The *Victoria* thus relieved resumed her ascending motion, mounted a thousand feet into the air, and the wind, burying itself in the disinfated covering, bore them away toward the northern part of the lake."

The title of this amusing and really fascinating narrative is "Five Weeks in a Balloon."

## LANGUAGE AS ONE OF THE SCIENCES.

THE history of Philology closely resembles that of all other sciences. Like them it has passed through its theological, empiric, and positive stages. Just as, in Astronomy, there was a time when the stars were regarded as divine animals, or as "nails fixed in the crystalline sky," or as having no other function than to illuminate the nights of earth—just as, in Geology, there were periods when it was believed that the earth in its present condition was called into being by the work of six solar days, or that the fossils were mere abortive forms, "the sportings of Nature," or that they were due to the supposed necessity for some deceptive law of "prochronism"—so in Philology there were times when language was believed to have been given by distinct and immediate revelation to mankind. God was supposed to have spoken visibly with Adam, and to have uttered His creative fiat in articulate sounds of human utterance. Words were believed to sway the dumb blind motions of circumstance by virtue of a certain natural force, and mystical affinity with the things they signified. The stage in which there began to be an observation of certain obvious phenomena, and a premature attempt to guess at their explanation by natural causes; the stage of the Ptolemaic system in Astronomy; the stage of the Neptunian and Plutonic theories, with their respective cataclysms and conflagrations, in Geology—had their exact counterpart in the long epoch of linguistic empiricism, during which it was an accepted belief that all languages were derived from Hebrew, and every observed fact was with supreme violence coördinated to that *a priori* conclusion.

We must, however, remember that the errors were not all on one side. The conventional theory of the origin of language held by such men as Lord Monboddo and Condillac, "Qu'on croirait avoir diné avec nos premiers parents," is as a *heterodox* attempt to account for the phenomena of language—hardly less absurd than the theory of Voltaire, that "the fossil shells of Europe were scallop-shells dropped by the mediæval pilgrims." But Philology, like its sister sciences, rose from these metaphysical and empiric stages to the acquisition of scientific methods and positive results. In each instance this advance was due to the powerful influence of an apparently accidental discovery. The external impulse given to Astronomy by Galileo's discovery of the moons of Jupiter and the phases of Venus—the external impulse given to Geology by Buffon's prescient estimate of the facts to be deduced from the fossil bones and shells submitted to his inspection—was given to Philology when, in 1786, the Asiatic Society was founded by Sir W. Jones; and he announced the then startling conclusion, that "no philologist would examine the Sanscrit, Greek, and Latin without believing them to have sprung from some common source." But if Sir W. Jones be the Galileo of Philology, Halhed was its Copernicus. As the editor of the code of Gentoo law, drawn up by order of Warren Hastings, he was the first who made known the word "Sanscrit" to English ears, and the first to express that astonishment at its resemblance to Persian, Greek, and Latin which was destined to be the fruitful mother of so much marvellous and inestimable knowledge.

It will be seen, from this brief sketch, that Philology has suffered as long and as seriously as other sciences from the dominance of merely traditional assumptions—and has suffered in a precisely similar manner. It took centuries for Astronomy to disembarass itself of the empiric belief in the geocentric hypothesis; for Geology to get rid of the attribution

of all marked terrestrial phenomena to violent and sudden catastrophes; and for Philology to disprove the assumption that there must have been a primitive language, and that Hebrew must have been the primitive language, and consequently that all languages are deducible from the Hebrew. Few people are aware of the vast mass of linguistic literature which has been rendered practically valueless by the abandonment of this erroneous hypothesis; by the *demonstration* that, if there were a primitive language, no traces of it are now discoverable, and that, if they were discoverable, Hebrew is one of the very last languages in which any one, moderately acquainted with the facts, would think of looking for them. But, although the progress of discovery seems at first sight to rob the labors of past investigators of all importance, we must beware that we do not push too far so ungrateful a conclusion. No honest worker ever worked at any science quite in vain. He at least helped to contribute the solid facts on which all theories must be founded, and to bequeath a sacred heritage of *interest* in the subject to which his labors were devoted. The coral at a certain distance beneath the ocean surface is the only *living* portion of the gigantic organism, but its life was only rendered possible by the death of those zoophytes who furnished in myriads the calcareous secretions which even now are forming the solid bases of "continents to be."

It would be easy to show that there is hardly a single science which does not furnish us with analogies and illustrations for the study of language so obvious as to force themselves naturally upon our notice, and so luminous as to suggest important conclusions, as well as to furnish the terms in which they are expressed. We talk quite naturally of the *strata* of language; extinct words and forms spontaneously suggest to us the analogy of fossils; we find among them rare varieties and typical forms, and unique examples and intermediate species, and any philologist would instantly catch our meaning if we were to talk to him about a linguistic "dike," or about the "pipings" in two contiguous linguistic formations. Displacements and denudations and tertiary deposits and palæozoic systems have their existence in language no less than in geological phenomena, and, without any exercise of fancy, it would be easy to multiply such analogies almost indefinitely. They occur indeed spontaneously, and almost unconsciously, in every book which is written on the subject. The very word "roots," involving one of the most essential philological conceptions, is itself an indispensable and ineradicable metaphor. We talk quite spontaneously of the *soil* on which a language *grows*. "Language," says Bunsen, "has all the distinctive peculiarities of vegetable nature." In fact, the analogy between words and plants has even been sufficiently powerful to influence our linguistic conceptions, and it led Schlegel not only to the striking *metaphor*, but even to the erroneous *conception* that the suffixes of words bourgeoned from the roots like leaves from the stem—that the roots were in fact "living germs," organized bodies, which carried in themselves the principle of their development. Such a notion would naturally lead to mere mysticism, but it was hardly to be wondered at, previous to the victories won by analysis over inflectional terminations. And, although the notion of any inherent and self-developing power in roots is now justly discarded, yet the distinction between the material and formal elements in words—between the *stem*, or *root*, and its inflections—is as important to Philology, and throws as much light on its essential nature, as the discovery that every portion of a plant might be reduced to stem or leaf was to Botany; and, if we exclude the notion of a germinative force, we can hardly describe the linguistic discovery without using expressions which would recall to every naturalist the botanical fact. I may conclude this part of my subject by a quotation from a writer, who, not being specially either a botanist or a philologist, may serve to prove how naturally the phenomena of the one science may be described in metaphors which are entirely borrowed from the other. "The operative agencies of lan-

guage," says Professor Ferrier, "are hidden; its growth is imperceptible. *Like a tree*, unobserved through the solitudes of a thousand years, up *grows the mighty stem and the mighty branches* of a magnificent speech. No man saw the seed planted—no eye noticed the infant sprouts—no mortal hand watered the bursting of the grove—no register was kept of the gradual widening of its girth, or the growing circumference of its shade; till the *deciduous* dialects of the surrounding barbarians dying out, the unexpected *bole* stands forth in all its magnitude, carrying aloft in its *foliage* the poetry, the history, and the philosophy of an heroic people."

But the *methods*, no less than the *history*, of Philology are identical with those of the natural sciences. Let us, for instance, compare the processes by which Botany arrived at its present position with those which have resulted in the establishment of the science of language. It will require no manipulation on my part to show their complete identity in idea and principle.

Many centuries usually elapse before the first dawn of any science. Even the commonest and most obtrusive phenomena often remain unnoticed for immense periods. But every now and then rises some man whose eyes are opened, and the observations of such men, however elementary, gradually form a nucleus of simple facts which either lead to, or are interpreted by, some theory which at this early stage is usually erroneous. When sufficient facts are accumulated, a wider hypothesis is formed, which is supposed to sum up all past observations, and tends to stimulate the further inquiry which often overthrows the very hypothesis which it was intended to support. At last, by the aid of ever-widening induction, "by the collection of similar, and the distinction of dissimilar things," the facts are colligated into a final and established conclusion. These processes have taken place alike in Botany and in Philology. There were long ages during which the rude human swains paid equally little attention to the sounds which they emitted in articulate speech, and to the little "golden flowers" on which they trod daily with their "clouted shoon." Then followed that era of *imaginary knowledge*, in which fancy and ingenuity took the place of accurate investigation. The history of etymology, from the days of Cratylus down to those of Menage, passes exactly through the same phases as the history of Botany from the days of Dioscorides down to those of Cæsalpinus. No doubt during both periods the storehouse of reliable facts was being gradually filled—the habits and more salient peculiarities of plants being observed as well as the external grammatical relation of combined words. In fact, during this long period, the foundations were laid in both sciences for an *artificial* system which gradually led to a *natural* one.

It was by the observation of different and distinct ideas of speech that Philology arrived at a true classification of languages, just as it was by the study of foreign floras that Botany gradually acquired a natural system. If the wealthy Provençal gentleman, J. de Tournefort, had never travelled in the Levant, or the poor Swedish peasant, Karl Linné, had never visited Lapland, after they had already gained some knowledge of plants, it is probable that they would never have arrived at the conceptions which reformed and almost created the science of Botany; and similarly, Comparative Philology would not even yet have existed but for the mighty Providence which bestowed upon us the government of India, and guided to that country such scholars and Orientalists as Colebrooke and Sir William Jones.

All great botanists, from Cæsalpinus down to Linné, had probably foreseen the establishment of a natural system, just as all great philologists, from Leibnitz down to Colebrooke, had realized the conception of linguistic families; but in both sciences the final establishment of the theory on a firm and scientific basis was left to others. Bopp and Pott did for language what was done for botany by Jussieu. Borrowing from Magnol and Adanson the plan of arriving at a perfect *natural* system

by means of the points of resemblance suggested by *many artificial* systems, Jussieu added the immensely important conception of a *subordination of characters*, and thus advanced the science, both in its structural and its classificatory branches, a long way toward its present position. Now Philology has its various branches no less than Botany; its analysis of words corresponds to the study of vegetable structure; its arrangement of linguistic families, to botanic classification; its examination of the functions of formative syllables, to organography; even its *Lautehre*, or study of sounds, to microscopic histology. And in the present stage of these two sciences the student who adds any thing to our knowledge of *one* of these branches probably renders a service to them *all*. This is precisely what has been done by such "fellow-laborers with Hercules" as Bopp, and Grimm, and Pott. By that wide induction which led to the establishment of the *laws* that dominated alike in the resemblances and divergences of words, they introduced a cosmos of guiding principle into the chaos of multiplex phenomena.

### THE SCORPION AND ITS ANTAGONIST.

A FEW mornings since I received by post a small box. On account of the holes pricked in the cover I suspected it might contain something alive, therefore refrained from opening it until I had read my letters. It was fortunate I did so, for from one of the letters I learned that the box contained two live scorpions, a present from my friend J. K. Lord, who caught them under a stone at Heliopolis, in Egypt, and had sent them off at once. On opening the box carefully I saw two scorpions sitting in it, with their tails turned over their backs. They were divided from each other by a partition, and were very quiet; but on seeing the light they immediately began to move, so that I had to be careful not to let them escape into the room. Sending for a glass fish-globe, I turned the box suddenly over, and with a tap at the bottom shook them out into it. For a moment the scorpions remained quiet at the bottom; then, waking up, they suddenly rushed at each other, and began fighting and wrestling, claw to claw, like two bull-dogs. I had great trouble to separate them, and got one of them out of the globe. At last I succeeded, by using two paper-knives and a long pair of forceps. I wonder they did not poison each other or myself. In the course of the morning it was announced that a mouse had been caught in a trap. I immediately thought of testing the poison of the scorpion upon the mouse. The reader must know that my scorpion is a little beast with a body the size of a large black-beetle. He has small legs on each side like the legs of a lobster, and also two nipping-claws. At the end of the body is a tail, nearly two inches long, consisting of five joints, strung together like a bead necklace. At the end of the last joint is the sting, which consists of a horny bag the shape of an apple-pip, and armed with a brown-colored sting having the curve of a bramble-thorn. The point of the sting is exceedingly sharp. The general color of the scorpion is a horrid-looking waxy brown. The eyes of the scorpion—little black shining points—are situated at the top of his head. When preparing to fight he carries his tail in a curve over his back, and brandishes his sting with immense rapidity. He aims his blows directly forward, as a soldier gives a bayonet-thrust.

The scorpion was lying quietly at the bottom of the globe when I shook the mouse from the trap into it, but the sudden arrival of a stranger into his private apartments woke him up directly. He hoisted his sting, and began brandishing it about. The mouse shortly crossed his path; the scorpion instantly lunged his sting into him. This in turn woke up the mouse, who began to jump up and down like a jack-in-the-box. When he became quiet the scorpion again attacked the enemy, with his claws extended, like the pictures of the scorpion in the signs of the zodiac; he made another shot at the mouse, but missed him. I then called "Time," to give both combatants a rest. When the mouse had got his wind, I stirred up the scorpion once more, and, as "the fancy" say, he "came up smiling." The mouse during the interval had evidently made up his mind that he would have to fight, and not strike his colors to a scorpion as he would to a cat. When, therefore, the scorpion came within range, the mouse gave a squeak, and bit him on the back; the scorpion at the same moment planted his sting well between the mouse's ears on the top of his head.

The scorpion then tried to retreat, but could not, for one claw had got entangled in the fur of the mouse; and then came one of the most ludicrous scenes I ever beheld. Mouse and scorpion "closed," and both rolled over and over together, like two cats fighting. The scorpion continued stabbing the mouse with his sting, his tail going with the velocity and swift spring of a needle in a sewing-machine; in fact, the scorpion had the mouse, as pugnacious schoolboys used to say, "in chancery." The moment the scorpion got tired, and the lunges of his tail became less frequent, the mouse got hold of the last joint of his adversary's tail with his paw, and gave the sting a sharp nip with his teeth (it was most interesting to notice that the mouse used his paw). The scorpion at once tried to make his retreat, but he couldn't get away, as his claws were entangled in the fur. The mouse seized this opportunity, and deliberately bit two of the scorpion's side legs off. He then retired to the corner, and began to wash his face and comb his fur. I took out my watch to note how long it would be before the poison of the scorpion took effect. I waited minute after minute, and nothing happened; the mouse seemed a little tired, and that was all. When ten minutes had passed I shook the scorpion up to the place where the mouse was sitting. The scorpion was a plucky "arachnoid," for he tried to come up to the scratch once more; but as a ship is disabled when she has lost her mainmast by a shot, so "*Scorpio formidolens*," as Horace calls him, was crippled for further encounter. He tried to hoist his sting, but the bite from the mouse had injured his tail, so that he could not strike straight with it, and it had lost its spring from the wound. Seeing that the scorpion was "lying under bare poles," the mouse sat himself down and began deliberately to eat the scorpion's legs up one after the other. I was at this time obliged to go away to my work, and when, in about six hours, my secretary came down to my office, he reported that the mouse had shown no symptom whatever of poisoning. When I came back in the evening I went at once to the globe to see what had happened; instead of finding a dead mouse I found about half a dead scorpion, and a live mouse. The mouse had, in fact, made a good meal of his enemy. Some bread had been placed in the globe; the mouse had eaten this also, so I hope he had enjoyed his meal of bread and scorpion. The battle therefore was decided in favor of the mouse, and the backers of the scorpion had to "throw up the sponge," while, as a reward for his courage, the mouse, after a parting supper of toasted cheese and milk, was let free in a place where the cat was not likely to find him. The friends of the scorpion have lodged a protest, inasmuch as the scorpion was not "in training," and the mouse was not a "fair mouse," being too large and too heavy. For my own part, I think the fight was hardly fair, as the scorpion had just come off a long, cold journey, and had not eaten any thing. The mouse, on the contrary, was just caught and in good condition.

### TREE-WORSHIP.

OUR purpose is not to speak of that part of the pagan theogony which transforms every bush and tree into so many gods, demigods, and goddesses, nymphs, fauns, satyrs, and hamadryads; nor do we refer to the symbolic or sacred character which the Greeks and Romans attributed to certain trees that their priesthood had consecrated to the deities: the myrtle, for instance, to Venus; the olive, to Mercury; the laurel, to Apollo. Our object is simply to mention the worship offered to trees by certain nations and tribes on account of their real or imaginary properties.

The Gauls entertained a peculiar veneration for the mistletoe. In the Gallic language, *gui*, or mistletoe, signified *plant*; and in the symbolic phraseology with which the Druids only were familiar, the word *chen*, meaning oak, or the tree of all others, stood for *force, power, authority*.

The oak mistletoe was gathered every year, in the month of December, by the high-priest of the Druids, or by the queen of the female Druids, with a golden sickle, and was received in the skirts of a white tunic.

The juice of the ivy was considered a very efficacious counter-poison, and a useful agent in promoting fecundity in animals.

In Germany, it was believed that no one who had a sprig of mistletoe about his person could be wounded, and that he was even certain to hit those at whom he aimed his arrows. However, the Germans never rendered worship to the ivy or the oak, as the Druids did in their mysterious forests.

The ancient people of India, if we are to believe Quintus Curtius, had a profound veneration for certain trees, before which they were in the habit of kneeling, in the attitude of devotion; and the most terrible punishment awaited the sacrilegious transgressor who might dare to injure one of them.

In Persia, there are two kinds of trees that are worshipped to this day. The one is the *dirakeh-i-fusel*, or, *tree that surpasses the rest*; the other is the *dir-dar*, or *tree of the genii*. The true believers decorate these trees with strips of precious stuffs. The ancient Persians had a particular veneration for the *barrom*, a gigantic tree, over which the sun, as they believed, kept watch in an especial manner.

The Orientals, generally, have always had an exceptional respect for the cypress.

When Xerxes bedecked a plane-tree that he met with on his march, with ornaments, it was not, as has been foolishly related, through an absurd, insatiate passion for the mute plant, but through religious feeling.

The Ouigours, a people of northern Guinea, worshipped the cypress and the birch. The ceremonies of this curious rite took their origin in a legend relative to the establishment of their kingdom.

One day, says the legend, there suddenly rose out of the ground, at the confluence of the two principal rivers, two marvellous trees, that gave forth melodious sounds as they shot up into the air.

When they had grown large and were covered with leaves, they opened from top to bottom, and there stepped forth from them five children, one of whom became the king of the Ouigours. When these children had grown up, they approached the trees with great respect, and the latter spoke to them, giving them good advice, and wishing them long life and great renown. Thenceforth the Ouigours, seeing in the cypress and the birch the cradles of their first king and first law-givers, rendered to these trees the homage that we offer to the real God.

Beside these trees, which superstition has elevated to divinity, may naturally be placed certain other productions of the vegetable realm, which ignorance and prejudice have, at different periods, made the object of the admiration, the wonder, or the awe of races of men. Of this number is the upas-tree, that grows on the island of Java. Travellers relate that this tree exhales a poison so virulent, that all other vegetation in the neighborhood is destroyed. Not a bush nor a blade of grass is to be found in the valley where the upas grows. The surrounding mountains are sterile rocks. This terrible spot has neither birds, quadrupeds, nor reptiles. Here and there is seen, bleaching on the ground, the skeleton of some hapless wretch who, having been condemned to death, had obtained the poor favor of an attempt to purchase his life by trying to gather the upas-poison for the sultan.

Such was the fable narrated by a Dutch surgeon in 1783, and subsequently contradicted by Dr. Horsfield. From the statement of the English botanist, it appears that the upas-tree does indeed contain a poisonous juice that flows from it when an incision is made in its trunk, and that arrows, dipped in this sap, inflict mortal wounds. But, far from causing other plants near it to perish, the upas of Java, found also at Macassar and elsewhere in great abundance, flourishes in dense forests only.

Similar fables have been told concerning the Sicilian manna-tree. The story was, at one time, prevalent that, upon a certain occasion, when the King of Naples was about to wall in the gardens of Enotria, which produce the best manna of Calabria, and subject the product to taxation, the manna dried up suddenly, and did not appear again until the tax was abandoned. Now, this legend simply masks a gentle hint to governments disposed to grind the people.

The bread-tree, also, has given rise to singular stories. Rumphius, the Dutch traveller, once affirmed that the variety known as the *Jaquier heterophylla*, yields fruit so large, that a man cannot lift one of them! The truth is, that the fruit of the real tree is about double the size of a man's fist. It grows for eight months, and then is fit to pluck. For eating, it is cut in slices, and broiled on hot coals, or baked in an oven. When it commences to blacken with the heat, the burnt part is scraped off, and beneath it is found a sort of white, mealy pulp, as tender as the crumb of fresh bread, and greatly resembling in flavor a good wheaten loaf.

We now come to the *Dry-Tree*. A traveller of the thirteenth century, one William de Mandeville, has given a lengthy description of this wonderful tree, of which some theologians, not greatly troubled with scruples of conscience, speak in their books. The *Dry-Tree*, ac-

cording to their statements, grows not far from the tomb of Lot. It has been there since the beginning of the world, and, until the death of Christ, was always covered with green leaves. At the moment when Jesus breathed His last, all its leaves fell, and its trunk and branches instantly dried up, but without the tree itself dying.

William de Mandeville terminates his recital as follows: "Some prophecies say that a prince of the West shall win the Land of Promise by the aid of the Christians, and will have mass performed under the Dry-Tree, and that then the tree will become green again, and bear leaves. By this miracle many Saracens and many Jews will be converted to the Christian faith. For this reason, the tree is held in great veneration, and carefully and affectionately tended."

The good people of the middle ages were persuaded that it sufficed to have about one's person a piece of the Dry-Tree in order to be safe from nearly all the maladies that afflict the human species.

But even among Christians and enlightened people of the most modern day, there are some trees and plants that awaken emotions of reverence. Who, for instance, could gaze unmoved upon the few lonely cedars of Lebanon, the sole remaining witnesses of Biblical days and incidents? Of these but thirty were left in A. D. 1550; twenty-four in 1600; twenty-two in 1650; sixteen in 1700, and only seven in 1800.

The weeping willow and the sombre yew are ineradicably associated in our minds with the scenery of the churchyard; and quite as naturally, although through habit merely, do we connect the laurel and the vine-wreath with thoughts of triumph and festivity.

The witch-hazel and several of its kindred enjoy the credit of possessing supernatural qualities among the peasantry of all Europe to this day, and to thousands that "rare old plant, the ivy green," is still an object of superstitious regard.

Religion, in all ages and climes, has found powerful auxiliaries and exquisite symbols in the garden and the grove.

## SPEED OF UTTERANCE IN DIFFERENT LANGUAGES.

THE understanding of the spoken language in Italian, Spanish, and German, presents great facilities, owing to the correspondence between the pronunciation and the orthography. But the most difficult of all languages for a foreigner to understand is perhaps the English, on account of the complete absence of analogy in the alphabetical representation of its pronunciation, as well as of the rapidity with which it is spoken and its innumerable contractions.

This is humorously illustrated in the following anecdote: In a late trial before the Queen's Bench, Mr. Hawkins, a barrister, had frequently to advert to that description of vehicle called brougham, which he pronounced in two syllables. Lord Campbell, the chief justice, suggested that the word was usually contracted to broom, and that he had better adopt the latter pronunciation, as he would thereby save one syllable and gain so much time. Henceforward Mr. Hawkins called it broom. Shortly after, the pleading turned upon omnibuses; and Lord Campbell frequently used the word omnibus, to which he gave its due length. "I beg your lordship's pardon," retorted Mr. Hawkins, "but, if you will call it bus, you will save two syllables, and make it more intelligible to the jury." The learned judge assented to the proposed abbreviation.

Some people think that the French language is spoken faster than the English; this is a great error. Voltaire shrewdly observed, that an Englishman gains every day two hours on a Frenchman in conversation. The truth is, that English is spoken considerably quicker than French. This results from a difference of kind in the pronunciation of these languages.

Pronunciation is composed of two elements, vocal sounds and articulations, represented in writing by vowels and consonants. Vocal sounds admit of duration: quantity is their essence. Vocal articulations, with few exceptions, cannot be prolonged: instantaneity is their essence. When a consonant is placed after a vowel, it generally shortens it. Thus the long syllables, *me, we, fie, no, due, though*, become short by adding consonants to them, *met, web, fib, fit, fig, not, dun, thought*. Now, in English, consonants predominate, and usually form the end of syllables; hence a rapidity of utterance is the unavoidable consequence.

In French, on the contrary, consonants act but a secondary part, and are often silent. The spoken words, in reality, end with vowel-

sounds, although consonants terminate their written representatives. In the division of the words, consonants seldom terminate syllables; the French word *caricature*, for example, is divided into syllables thus, cà-ri-cà-tù-rè; its pronunciation, conformably to this division, is necessarily longer than that of the English word, commonly pronounced, according to this other division, càr-ic-à-tùre. The same may be said of every other word in the two languages. The vowels, which contribute so much to lengthen the words, are pronounced full in French, as if every syllable were accented. From these facts there necessarily results a slow and steady enunciation.

As the opinion of a foreigner, however, in regard to the English pronunciation, can have little weight, we beg to quote a few competent authorities: "Such is the vehemence of our accent, that every syllable which follows the accented is not only short, but almost lost in the pronunciation." (Lord Monboddo.) "We incline, in general, to a short pronunciation of our words, and have shortened the quantity of most of those which we borrowed from the Latin." (Hugh Blair.) "Such is the propensity for dispatch that, overlooking the majesty of words composed of many syllables aptly connected, the prevailing taste is to shorten words, so as to make them disagreeable to the ear." (Lord Kames.) "It must be regretted that contraction subjects our tongue to some of the most hissing, snapping, clashing sounds that ever greeted the ear of a Vandal." (John Walker.) "Our rational conversation is, for the most part, carried on in a series of most extraordinary and rugged abbreviations, a species of short-hand talking." (Bulwer Lytton.)

### AIR AND THOUGHT.

IT is related of Alexander the Great that, having captured some outlandish barbarians, he consulted his scientific adviser, Aristotle, as to the propriety of killing them. Aristotle recommended an inquiry into their physical circumstances, and particularly as to the *air* they had breathed, before deciding whether or not they were worth saving. Though this was putting rather a serious aspect upon bad ventilation, yet, in connecting the quality of the air with the character of the people respiring it, we are persuaded that the old Stagirite was not so far wrong as many may suppose. Let us look a little into the connection as traced in the light of our better knowledge.

It is now well established that mental activity depends upon cerebral activity, and that cerebral activity in turn depends upon oxygenated blood. The character of the mental organ qualifies that of intellection in all its grades, from the idiot who cannot feed himself to a Napoleon Bonaparte who aspired to rule the world. But whether the brain be good or bad, the quality of its action depends immediately upon the oxygenating process. Of course, no amount of oxidation could cause the brain of an idiot to evolve high mental results, for the organ of thought is structurally deficient; but no brain, whatever its grade, can do as good work or as much work, where this process is defective, as where it is perfect. Beings of a lower organization are, of course, less disturbed by atmospheric impurities than those of a higher character, for the more complex the mechanism and the finer the effects it produces, the greater is the necessity for nicety and completeness of conditions. No doubt when the brain is lowered in efficiency by impure air, it is possible to exalt its action by artificial stimulation with tea, coffee, tobacco, or alcohol (and it is unquestionably a cause of their frequent employment); but this does not disturb the truth of our statement, for the transient effect will undoubtedly be greatest when these stimuli conspire with perfect atmospheric conditions.

We have spoken of degrees of perfection in the structure of the brain; of degrees of perfection in its oxidizing processes, and of degrees of perfection in the mental results. The two former are obviously measurable. The anatomist reports on the amount of cerebral nerve-matter and the degree of its organization. The chemist defines purity of the air, and gives us the scale of its deteriorations. But can the psychologist speak with equal definiteness of the corresponding grades and amounts

of mental performance? There is, no doubt, more of vagueness and difficulty in this, but the principle, though less clearly defined, will be found to hold here as in the other cases.

There are two kinds or grades of mental activity which, although imperceptibly shading into each other, may nevertheless be broadly distinguished as higher and lower. Intellectual action constantly tends to become automatic. Actions frequently repeated acquire a tendency to repeat themselves. They become so easy as to cost little effort, and it may at length require exertion to stop them. This is the meaning of the power of habit. Incomparably the larger portion of the world's thinking is of this kind. People think and act as they are in the habit of thinking and acting. They converse, harangue, write, imprecate, and pray, in the set phrases which they have acquired by imitation and repetition. This kind of automatic mental action, as it is allied to the mental workings of the inferior animals, may be regarded as the lower form of intellectual manifestation.

The higher form of thought is less mechanical, and consists in bringing the mind to bear upon the materials before it. It is to reflect, to compare, to judge, to make new combinations, to form independent conclusions—in short, to "make up one's mind." To revise the data of opinions, and breaking out of the beaten track to form new opinions more in harmony with the facts, is the highest function of mind; and it is just as essentially displayed by the mother when she contravenes fashion and conforms to reason in the dressing of her child, or by the merchant in weighing the trustworthiness of a candidate for credit, as by the philosopher in forming a new scientific theory.

Now these two forms of mental activity have their respective physical conditions and accompaniments. That higher mental action which involves the establishment of new relations among the elements of thought, involves also the highest action of the organ of thought. The brain draws upon the system for a greater supply of blood, and the cerebral changes, of which oxygenation is the mainspring, proceed at an accelerated rate. On the contrary, automatic mental activity, employing as it does less effort, involves a less amount of cerebral change, and may take place in less perfect conditions of change.

It is therefore clear that to these two grades of mental action the air which impels the thinking mechanism stands in very different relations. In fact, as there are two qualities of thought depending upon two sets of cerebral conditions, so there are two states of the air which correspond to those conditions. To maintain the higher form of cerebral activity, air of perfect purity is required; impure air disturbs and defeats it. On the other hand, the easier processes of automatic thinking go forward with little or no disturbance in vitiated air. There is then a state of mind to which pure air is essential, and another with which foul air is congenial. Contaminated air is more favorable to routine work, and the mental processes that have become habitual, than to those which involve a critical and questioning deliberation. Fresh air raises the spirits, stimulates hope, and encourages to action: foul air depresses the spirits, favors gloomy and discouraging views, and thus paralyzes action. Air loaded with contaminations, as it tends to mental dulness, is therefore congenial with the stupidities of blind tradition and the stolidities of unreasoning conservatism. On the contrary, pure air, by quickening the highest cerebral functions, favors freedom and boldness of thought, enlargement of view, and consequent independence of action. As the mass of people accept their opinions ready made, and fall spontaneously into ruts of thought, they are naturally and instinctively content with bad ventilation, while those who put their brains to their highest possibilities are so few that their protests, if made, are unheeded.

There is an important hint here for the guides of public opinion: Why should they not have an atmospheric policy? If the old fogies will assiduously plug up the apertures of their

assembly-rooms, and the progressives will hold their conventions in the open air, they will do quite as much to promote their respective ends as can be accomplished by all the arts of rhetoric. Truth, we doubt not, has inscrutable affinities with oxygen; while error, like the reptiles of old, flourishes in an atmosphere laden with carbonic acid.

In affirming this relation between the highest action of the mind and the quality of the air respired, we are not dealing with wire-drawn fancies. There is more in this idea than is dreamed of in our current philosophy, as every student can testify who heeds the conditions of his best mental exertion.

We began by quoting an alleged opinion of the greatest man of science in the ancient world, and may fitly close by referring to the greatest man of science in modern times. The immortal discoverer of the law of universal gravitation probably did more original and powerful thinking than any other man who ever lived. His great brain, when wrought to its highest capability, revealed a new order of the universe. How did this mighty thinker stand on the question of air and ventilation? His record is conspicuous. Knowing nothing of what the air is composed, and nothing of the nature of the respiratory process, the dictates of sensation were sufficient, and he scrupulously obeyed them. Sir Isaac Newton was a member of the British House of Commons, and during the whole course of his parliamentary career he is reported to have made but one speech, and that a very brief one. He arose and asked a person in the gallery to open a window.

#### AUTHORITY IN OPINION.

REFERRING to Stephen Pearl Andrews's "Universology," or newly-discovered science of the universe, the London *Saturday Review* has the following remarks on the state of mind in this country, which favors the multiplication of all kinds of mental extravagances:

Americans sometimes boast—and with occasional truth—that they discover English writers of genius before they have gained honor in their native country. They do it, however, at the price of accepting also a good deal of rubbish. Tuppens pass current there as well as Tennysons, and sham philosophy, if it only uses big enough words, and asserts itself with sufficient audacity, secures a foothold as well as the genuine article. The most high-flying transcendentalism will find sympathetic souls in Boston when it can excite nothing but a sneer in London.

There is nothing surprising, and certainly nothing discreditable, about this. It is an illustration of the real meaning of the frequently-misused term, that America is a young country. The analogy between a nation and an individual is apt to mislead; but in some points there is a genuine resemblance. Most clever young men go through a certain phase, as naturally as babies take the measles. If poetically inclined, they are cured by a favorable eruption of bad verses; and if given to speculation, they frequently invent what Mr. Andrews so happily calls universology. An intellect of average strength and cultivation discovers, generally about the age of twenty-three, that it has not quite solved the 'riddle of the painful earth;' that there are flaws in the scheme which once seemed so perfectly satisfactory; and that the same ideas which looked so novel and startling, had previously occurred to more than one philosopher since men began to speculate.

Occasionally men of ability are so peculiarly constituted that they carry on this temper of mind into maturer life; and they then develop into the creators of the various ephemeral Utopias which amuse or sadden us for a time. Great social convulsions such as the French Revolution naturally encourage this temper, and throw up St. Simons, and Fouriers, and Comtes, because they seem to open wide possibilities for mankind; and America, in a certain sense, is in a permanent state of revolution. The order of things changes so rapidly, and the whole mind of the people is so constantly set upon the development of its vast resources, that it is no wonder that enthusiastic people suffer from a kind of spiritual intoxication. Every thing seems to be possible; and it is the most natural thing in the world to propose a com-

pletely new system which shall introduce an impromptu renovation of society from top to bottom. There is no deeply-rooted respect for old traditions to hamper the boldest schemer; he has, as it were, a blank sheet of paper on which to draw his diagrams just as pleases him best; and he naturally gives full play to the indomitable hopefulness which is the most attractive feature of new societies. In a less satisfactory sense, he falls into the credulity which in an old country is eradicated before a man grows up to years of discretion. There is as yet no thoroughly cultivated class in America which can speak with authority in matters of speculation. One man is as good as another—not merely in regard of his political rights, but because he has attained pretty nearly the same level of cultivation. No ferocious critic sits in the seat of judgment ready to pass sentence on any impostor who claims to be a leader of thought. Doubtless such a class is being slowly developed; but, meanwhile, questions, which ought to be decided by competent judges, are determined by universal suffrage or popular acclamation.

We are astonished at the success with which the impositions of spiritualism thrive on Transatlantic soil. No story of eccentric tables and mysterious spirit-writings seems to be too gross to find favor. New dodges are found out as soon as the old ones disappear; and a little sleight-of-hand would enable any unscrupulous person to make a very comfortable living out of our kinsmen. If we ask why similar delusions are not so prevalent in England, we can hardly flatter ourselves that it is because we have in general attained a higher intellectual level. Everybody has known persons of apparent sanity, and even sense, who believed in the whole nonsense of spiritualism. And it was easy to see, in the discussions produced by the case of Home, that most people, whatever their judgment might be, were incapable of forming it on scientific grounds. They did not in the least appreciate the requirements of sound reasoning, or know what tests should be satisfied before the advocates of such an amazing doctrine would acquire a right to be heard.

The peasantry, we are often reminded, are still at that stage of education in which a belief in witchcraft is possible, though it need not always exist; and it is probable that the majority of the upper classes are equally capable of believing in spiritualism; that is to say, a good round assertion of its truth would find them incapable of testing it critically. Now, American believers are, very many of them, fully as intelligent as the body of English skeptics. What is more singular, they have generally a rather higher respect for the claims of science, and are apt to clothe their intolerable nonsense in a singular scientific jargon. They generally argue with naive ignorance of the subject. Thus they fancy that a belief in discoveries about electricity (the favorite name for every thing that people don't understand) ought to make a belief in spiritualism easier, and run over all the fine words which will doubtless find a place in the science of Universology. The true difference between the cases is, not that the general run of Englishmen are more intelligent or more sensitive to the claims of science, but simply that they have a court of appeal for which they have a good deal more respect. They have a dim belief that a spiritualist must be a fool, because Faraday or Dr. Tyndall assures them that spiritualism is folly. In America, where there is a general presumption in favor of any thing that is new, there is also no one to exercise any supervision over the purveyors of novelty. They are, in short, in the same intellectual position as the youth who has read some popular books of science, but has not learned by experience the labor which goes to form a scientific authority.

#### TABLE-TALK.

THE contrasts of social life in London are favorite subjects of sensational description, satirical animadversion, and philanthropic lamentation. At one extreme, there are the rich, wallowing in unbounded wealth and all the extravagance of luxury; and, at the other, squalid poverty, beggary, and pauperism, in their most frightful and sickening forms. Shall we infer then that, in this great Babylon, the fountains of human sympathy are dried up, and that all charity is dead? Far from it. The provision for the relief of destitution and suffering is on a scale which no other city in the world can parallel. The London *Times* has lately made a rough investigation into the charitable

resources of the English metropolis, and devoted three pages of its large sheet to a tabulation of results. Its footing up shows *ten million dollars a year* devoted to purposes of charity.

The Bishop of London, who has long been a close student of its charities, and an authority in all that pertains to it, follows the *Times's* account by a statement, in which he says that, if the excepted items of the *Times's* reporter are filled out, the figures will be doubled. According to the highest authority, then, the sum expended by organized charitable associations in London amounts to *twenty millions of dollars a year*; and this, he it remembered, is exclusive of private aid and of the enormous expenditures for relief under the poor-law. And what is the result? Not a diminution, but an increase of poverty and pauperism—in the language of the *Times*, “Such a spread of want, misery, pauperism, and crime, that we are at our wits’ end to meet it.”

Some singular facts have been developed in the course of this investigation which assist to explain the confessed failure of this method of relieving the needy. In the first place, one-quarter of the money is absorbed in running the institutional machinery which stands between the donor and the recipient; that is, it takes five million dollars to work the organizations which disburse fifteen millions. In the next place, the extent and perfection of the organizations for charity have led to something like a counter-organization on the part of impostors to get the money. There are a thousand charitable associations, and, of course, many are devoted to the relief of the same objects; the temptation thus offered for the same individuals to get money from different associations, tends naturally to the multiplication of impostors. The *Times* says: “Large sums are consumed in expensive and superfluous machinery, and large sums again are lavished in the support and encouragement of systematic and organized imposture. In the mean time, though charity so freely gives, deserving poverty is not relieved.”

About fifty years ago, one of the most fashionable young New-Yorkers was Colonel M—, who, being rich, handsome, and well-connected, had fallen into the habit of strutting along Broadway in a very lofty and pompous manner. As he one day approached old Trinity Church, he saw Washington Irving standing on the stone base, and holding fast to the iron railing in front of the church. “Hallo, Irving, what the deuce is the matter?” shouted the colonel, and, in reply, heard these words: “Why, I supposed, from your manner of walking, that Broadway must belong to you, and so I’m trying to get out of your way.”

Robert Buchanan, following if not imitating the example of Charles Dickens, has appeared before English audiences as a reader of his own poems. He has been, we believe, successful; and this success, as in the case of Mr. Dickens, has arisen from his power of dramatic characterization rather than by his skill as a reader. Artistic reading is the perfect use of emphasis and inflection. Mr. Dickens is singularly at fault in both; but he has the actor’s talent of dramatic personation. Mr. Buchanan, we are told, threw his audience in tears on reading his poem of “Willie Baird.” It would be a strange humanity that could listen to this pathetic poem with dry eyes, even if the dullest of readers were uttering it.

It is somewhat singular that we have produced no good dramatic reader in this country. We are often told that there is a good deal of amateur dramatic talent in private society. It may be so; but clearly it never gets on the stage or into the reading-desk. The public speakers of America are probably about as pompous, loud-mouthed, and manneristic a set of declaimers as the world can show. Their delivery is ruled either by the pulpit or the platform, and it would be hard to say

which is the most abominable. Our lecturers, for instance, usually have the manner of the pulpit, and preach; or the manner of the platform, and declaim. Dramatic reading, as presented by Mr. Dickens or Mrs. Butler, is highly entertaining. But mere declamatory reading is an offence. What our public speakers really need is the art of effectively *talking* to an audience. The most perfect delivery of this kind we recollect was that of Thackeray’s; there was great art in the nicety of his emphasis and inflection, but his sentences glided from the tongue in a smooth, simple, unaffected, yet singularly effective manner that was a triumph of the art that conceals art.

It is rumored that we are to have a Museum of Natural History in the Central Park—a circumstance which will not be more gratifying to the citizens of New York than to the people throughout the country, who have a pride in the metropolis, and all of whom expect to visit it some day or other. The value of such an institution, not only as a source of interesting and instructive recreation to the throngs who will visit the Park, but as affording a rallying-point of scientific effort and organization, will be great and important. There can be no doubt that art and science are very considerably out of balance in our metropolitan thought and activity. That the interests of art are better appreciated, there can be no better proof than is afforded by the Central Park itself, while the interests of science are without a corresponding recognition or expression. A museum of natural history, on a scale commensurate with the wealth of the city and the artistic perfection of its local surroundings, will relieve us from our present reproach, and give a vigorous impulse to scientific pursuits. The kindred work of restoring some of the gigantic American fossils, which the Commissioners have commenced, and which is but a part of the comprehensive plan for the illustration of natural history, is already of much interest to men of science, remote as well as near, and will be a marked element of public attraction.

But more important still is the bearing which such an institution, or group of institutions, will have upon the cause of popular enlightenment; and we are glad to note that the Commissioners recognize this in speaking of the contemplated museum as “an aid to the great educational system of the city.” This is, after all, the most valuable and vital aspect of the movement. A museum of natural-history objects, so arranged as to be thoroughly accessible, and accompanied with clear and simple descriptions of the objects, might be systematically visited by classes from our public schools, and a knowledge of things instead of words—a most desirable end in education—would be thereby essentially promoted.

Considerable discussion has been going on in the English papers in reference to Mr. Robertson’s new comedy of “School” and its claim to originality. The comedy was at first enthusiastically praised on account of its novelty and freshness, but a correspondent of the London *Times* showed that its plot was entirely drawn from a German play called “Aschenbrödel;” whereupon Mr. Dion Boucicault hurries into print in defence of Mr. Robertson—prompted very naturally by a fellow-feeling—and insists that this “ridiculous cant about originality should be exploded.” What the “ridiculous cant” is, does not seem quite clear—unless it is that play-makers must be allowed to beg, borrow, or appropriate, where they list and how they list, and the critics to accept what is offered in thankfulness and peace. Mr. Boucicault claims that the language of “School” is original, and cites a host of authorities to prove that in rehabilitating a drama from foreign or remote sources, Mr. Robertson has not transcended the law and the custom of the stage. Mr. Boucicault’s letter has brought out numerous other correspondents, some in defence of and some in opposition to his arguments. The writer, it seems to us, forgot or ignored the

real issue. It is Mr. Robertson's reticence and want of candor that are justly complained of. The comedy of "School" was specially praised for exactly that quality which was derived from the foreign origin. Every one who is acquainted with the comedies of "Caste" and "Ours"—which we consider the purest and best productions in recent dramatic literature—would expect to find in a new drama from the same pen the taste, skill, and genuine power, for which those plays are so justly noted; but, when something is shown to have been concealed, a distrust arises which must necessarily qualify the public praise.

A New-York journal sums up a political article by declaring that "the whole use of government is to make things cheap." Would it not be better if government did not attempt to regulate either the cheapness, or dearthness, or value, or price of "things?" When it is discovered that the whole use of government is to make "things" secure, we shall have advanced a little in our knowledge of political economy.

There are two things common in our New-York architecture which are utterly destructive to its dignity. One is the use of iron. There is no beauty of texture in the material itself, and the necessity of covering it with paint renders it in effect mean and contemptible. Paint in architecture is at all times a degradation; when fresh it is glaring and vulgar, when old it is dingy and stained. The other defect referred to is the custom of concentrating all the ornamentation on the fronts of buildings, leaving the rear and side walls piles of rough, cheap bricks. Warehouses built in this way may, perhaps, be tolerated, but in public buildings it is inexcusable. The Academy of Design building, for instance, viewed from the front, is very unique and beautiful; but, if approached from the upper side along Fourth Avenue, a blank pile of rough, unfinished brick confronts the spectator. Opposite this building the Young Men's Christian Association are erecting a very large, costly, and handsome structure—handsome, if you stand where the architect designs you to stand—but if you approach it from the south or the west, directions from which it will be seen more frequently than from any other, you will see nothing but tall altitudes of cheap brick and mortar. Almost all our buildings are marred in the same way. That is not architecture worthy the name which does not stand isolated, and present a finished picture from every point of view.

General Wilson, Fitz-Greene Halleck's literary executor and biographer, supplies us with an anecdote of the poet which has not elsewhere appeared. Halleck's habit of maintaining unusual opinions in a manner between jest and earnest, on one occasion cost him the loss of a fine portrait. Seth Cheney, a simple-minded, serious, and credulous artist, who died in 1856, was very successful with his crayon-pictures, transferring to the sheet before him the finest and most elevated expression of which the countenance of his sitter was capable. Halleck once sat to him, but the painter found the frame of mind which he brought to his task disturbed by the poet's rattling fire of "quips and cranks and wanton wiles," and by the sportive manner in which his sitter spoke of certain matters which, to the mind of the artist, should only be referred to with the utmost reverence. One morning when Halleck came as usual, Cheney said to him: "I have finished your likeness." "You have been expeditious," said the poet, with that old-school courtesy for which he was so noted. "Yes," replied the painter, "I put it in the fire this morning."

The third number of APPLETONS' JOURNAL will be accompanied by a steel-plate engraving, from a painting by KENSETT, called "Neon on the Sea-shore."

## Literary and Personal Notes.

PROFESSOR BICKMORE'S "Travels in the East-Indian Archipelago," published in New York by D. Appleton & Co., and in London by John Murray, has been well received by the English critics. "That an American professor," says the London *Examiner*, "should undertake a long and perilous voyage, mainly for the purpose of collecting shells upon the shores of the Spice Islands, shows that the devotion to science which distinguished the earlier *savants*, is still a living truth among its humble followers in the nineteenth century. . . . Let not the unscientific reader, however, imagine that the work is made up of somniferous and unentertaining descriptions of specimens, or that it is only suited to the student of natural history and the museum collector; for, besides an account of the Flora and Fauna of the tropical East, there are many amusing and pleasantly-written chapters detailing the manners and customs of the inhabitants. Indeed, the greater portion of the book is thoroughly entertaining reading; the scientific chapters even being pleasantly relieved by accounts of the adventurous explorations of Mr. Bickmore. We certainly know no other book which gives us so complete a survey, historical and scientific, of the islands which together form what is now called Malaysia. Sumatra and Java, Celebes and Timor, Ceram and Buru, Gilolo and other smaller islands, were all visited by the author; and their geology, inhabitants, and productions are described and descanted upon to much practical purpose."

*John Bull* calls the book "a delightful one," and adds: "We have no hesitation in pronouncing it the most charming and scientifically valuable book of travels published since Humboldt wrote that wonderful account of his travels in South America and Mexico. To naturalists, philologists, and ethnologists, these pages are of the highest value, . . . while the sportsman will revel in the accounts of tigers, rhinoceroses, buffaloes, deer, wild-boars, pythons, Malay pirates, and Dyak head-hunters. We have read these charming travels with the greatest avidity." *Land and Water* says, "We have seldom read a book of travel with greater pleasure;" and the London *Review* closes a long notice by saying, "The work is carefully written, and exhibits an amount of research that is most creditable."

The London correspondent of *Hours at Home*, in speaking of Mr. Lecky's promised new volume, "A History of European Morals from Augustus to Charlemagne," remarks: "In these days of personal gossip, the author of 'The History of Rationalism' stands almost alone in his incognito; even his publishers know little or nothing of him, except that he is a young gentleman, presumably of Irish birth, who spends most of his time travelling on the Continent. At the first glance, the period covered by his forthcoming book seems of singular choice; but, it will be noticed, that it includes the whole era of the death-struggle of classical paganism, introduction, and establishment of Christianity; what truths are received from special supernatural revelation, and what, from that earlier revelation in the reason of man, called by Dean Milman 'the great religious problem interesting to every thinking being,' and it may fairly be presumed that Mr. Lecky's book will afford valuable materials for its study."

Madame Rattazzi, *née* Marie de Solms-Wyse, cousin of the Emperor Napoleon, and grand-daughter of Lucien Bonaparte, has just published a novel entitled "If I were a Queen," and which has created quite a sensation both in Italy and France. One of the characters (the wife of the Italian ex-premier) indulges in the following Utopian dream of organized charity:

"If I were a queen, I should give—give with lavish hands, but with prudence, with deliberation—that honest poverty might be relieved, and laziness, much less vice, be not supported. I should organize a regular little army, which I should send out in search of hidden poor and sick persons, and to appear before them as messengers of charity and Christian mercy. How delightful it would be to save a mother in time from despair, and a young girl from ruin! From among the ladies of my acquaintance I should select the best, the wealthiest, and most charitable, and send them out into the quarters of my city that they might visit the most secret recesses of misery. Every morning I should then receive reports on the discoveries made on the preceding day, and should bestow warm praise on those who found out persons most urgently in need of relief. I should in this manner organize, as it were, a race of the charitable. I should then go out myself and bring relief to the poor; the misery of the families I should lessen by a better arrangement of their dwellings. I should buy a large, curtained bed for the parents, and bedsteads for the children of both sexes. I should teach the housewife to attract her husband by neatness and cheerfulness, and by means of good fare to cause him to cease visiting taverns. At the same time I should establish soup-houses, where nutritious viands would be prepared, and the time and money might be saved to the housewife. The homeless would find shelter and warmth at these soup-houses, and they might rest there before returning to their daily toil. I should bestow the most tender solicitude on the poor creatures that are

mothers without being wives; I should give them a small dower for their babes; I should support them if they wished to nurse them at their own breasts; I should teach them that they might blot out their disgrace by becoming good mothers. For the old and sick I should always have doctors and refreshments in readiness; during my visits to the various quarters of the city, wagons should always follow me to convey the sick to the hospital, unless their horror of it should be too great, as is unfortunately the case with so many persons of the lower classes. It would, therefore, be my desire to provide for the proper nursing of the sick poor at their own homes."

Buying "curtained beds" for poor folks is a novel but harmless form of charitable zeal, but a too "tender solicitude for poor creatures that are mothers without being wives," would be found, we should judge, to indefinitely increase this class.

Rocheport gets up the manuscript of each number of his *Lanterne* in a very peculiar manner. He writes his malicious witticisms and *mots* with a lead-pencil on small scraps of paper, which he holds on a book, while walking up and down his room. As soon as one of the scraps is filled, he throws it into a basket, which the "devil" empties whenever he calls for "copy." Sometimes there is nothing in the basket when the "devil" arrives. "The basket is empty, M. Rocheport," he then says to the great Lanternist. "*Mon Dieu*, is that so?" replies Rocheport, who seizes his book and pencil and commences writing, while pacing the room. Often, when a good idea strikes him, he bursts into a peal of laughter, flings his book and paper away, and throws himself on the sofa, laughing all the time at the top of his lungs. His best witticisms, he has often said, were not enjoyed more heartily by any one than himself.

The young King of Bavaria has a wonderful memory. He knows all of Schiller's poems by heart. The other day he was present at a school-exhibition in Munich. Some of the boys were to recite poems; the king took the whole school by surprise by prompting the boys without glancing at the book which was offered to him. A Munich correspondent says that the true reason why the young Russian grand-duchess was not betrothed to Louis the Second of Bavaria last summer at Kissingen was, because he talked to her all the time about literature, of which the young lady was rather ignorant. He was ungallant enough to recommend to her a more careful study of certain poets, at which she took umbrage, and said she would not marry him.

It is untrue that Queen Isabella of Spain is writing a volume of "Reminiscences," as certain London newspapers have asserted. M. Charles Yriarte, the French feuilletoniste, is writing, at Marforis's suggestion, a book destined to defend the ex-Queen of Spain against the aspersions of her adversaries.

Max Ring, the author of "John Milton and his Times" and other popular novels, says, in a biographical sketch of Louisa Mühlbach, that he never knew an author who, after once studying a literary subject thoroughly, was able to write as rapidly and elegantly on it as the authoress of "Joseph II." and "Marie Antoinette." Mr. Ring mentions in the article that Louisa Mühlbach writes at least sixteen pages of original matter daily, and the ease with which she composes her works is so great that there are hardly ever any alterations in her manuscript.

Alexander Dumas, Sr., is, at the present time, at work upon no fewer than six novels and three plays, besides a cook-book, and a work upon that humble but useful animal, the hog.

Justus von Liebig speaks five languages and reads eight. In his personal appearance he looks considerably younger than he really is. His manners are exceedingly courteous, so much so indeed that the late King Maximilian II. of Bavaria once said to his courtiers, "Somebody called Liebig the other day, in my presence, a dry bookworm; what nonsense! I have never seen a more polished and elegant gentleman."

Frederick Gerstäcker, the German traveller and novelist, has been urgently invited by the Emperor of Brazil, who is an admirer of his South-American novels, to visit Rio Janeiro in the course of the present year.

Victor Hugo's "L'Homme qui rit" will be published in no fewer than nine different languages—French, English, German, Spanish, Italian, Portuguese, Hungarian, Danish, and Swedish.

## Matters of Science and Art.

DR. H. CHARLETON BASTIAN, of University College, London, has made an interesting discovery in relation to the cause of the insanity which is attendant upon fevers. While experimenting, last summer, on the production of inflammation in the mesentery of the frog, he was much impressed with the amazing activity displayed by the white corpuscles of the blood in inflamed areas of tissue; and by

the fact that these white corpuscles, which had come into contact in or upon the inflamed mesenteric tissue, after they had passed out through the walls of the veins, cohere together, and finally fuse themselves into a single protoplasmic mass of varying size, according to the number of corpuscles of which it was composed. Upon subsequently examining the blood of patients suffering from rheumatic fever, typhoid fever, pneumonia, etc. (obtained by pricking the tip of the finger with a needle), he was again struck with the appearance of nodules of protoplasmic material in every way similar in composition to the white corpuscles themselves, though often forming masses from eight to twelve times as large as these. In a recent case of a man with erysipelous inflammation of the face and head, accompanied with delirium, so strongly was Dr. Bastian impressed with the foregoing facts, that he unhesitatingly diagnosed the "rebellion" of the white corpuscles of the blood as the cause of the delirium. The case terminated fatally, and, upon *post-mortem* inspection, the brain was found to be generally healthy; but a careful microscopic examination disclosed an actual plugging up of the minute vessels of its gray matter. These obstructions were unmistakably composed of cohering white blood-corpuscles, in some cases small, and formed by the union of three or four white corpuscles, while in others large, irregular-shaped aggregations, consisting of one, two, or three hundred adhering together.

The Siamese twins, Messrs. Chang and Eng Bunker, who have long resided in North Carolina, and lost their property during the war, have gone to England to make a little money by exhibition. The question of a surgical separation of the brothers has been submitted to some eminent physicians, and the results of recent examinations of their condition have been published. They are fifty-eight years of age, short in stature, Eng being five feet two and one-half inches in height, and Chang an inch shorter. The band that unites them sprang originally from the lower portion of each breast-bone, and at first held them face to face, but, by efforts in childhood, they were enabled to stand nearly shoulder to shoulder. Their inner arms are usually crossed behind each other's backs, but they can bring them forward over each other's heads, which is quite a curious movement, and are thus enabled to use all their hands, as at meals. The cartilaginous band which joins them is about four inches long, and seven in circumference, at the centre. The nerves of each extend a little beyond the middle of the band, so that a touch about an inch on either side of the centre is felt by both. There is, of course, a slight communication of the blood-vessels, but no interchange of blood, and no mutual dependence of circulation or respiration. They are, therefore, independent in personality, and are simply two persons tied together by a living knot. But although their mental operations are entirely distinct, their life-long similarity of experience has brought them into an extraordinary concord in thought and action.

The relative positions of the twins have produced an inequality in the action and efficiency of their organs: those turned toward each other, and therefore less used, being weakest. The adjacent eyes are in this way enfeebled, and the adjacent legs measure an inch less in circumference than the external ones.

The Messrs. Bunker married sisters, and have nine children apiece, Mr. E. Bunker having six sons and three daughters, and Mr. C. Bunker six daughters and three sons. The cousins do not get along together as well as the fathers, and there are times when each family wishes to have a father all to itself. The question of their separation has been raised on this ground rather than because the brothers desire it. The surgeons think that there is probably no anatomical impediment to their separation, but that the moral shock to two not very robust men, advanced in life, which would follow the breaking of the chain of life-long habits, would prove serious if not fatal.

They are reported as having educated themselves fully in the language and literature of this country; to be intelligent and agreeable companions, and to have won the respect and esteem of their neighbors.

It is stated by the *Scientific Opinion* that Messrs. H. G. Clarke & Co., of London, have invented and "published" a rival to the zoetrope, which they call the "Anorthoscope." The instrument produces very surprising optical effects out of prepared materials, which are remarkable chiefly for their chaotic absurdity. Indeed, before putting one of the plates into the machine to be interpreted, an interesting amusement is to try to find out what this colored confusion is likely to become. The "Anorthoscope" is highly ingenious, and certain to become popular.

It is reported that the authorities of the French mint have been experimenting upon the replacement of copper by zinc as an alloy for the silver coinage of the country, as well as for articles of silverware generally. It is claimed that the metal is more homogeneous, has a clear ring, considerable elasticity, and has a fine white lustre. It is less liable to be blackened by exposure to the sulphuretted hydrogen of the atmosphere, while there is no green coating formed by acids. Its constitution is 835 parts silver, 93 copper, and 72 zinc.

## The Museum.

HELMHOLTZ has shown that the motion or velocity of the electric current in man is at the rate of two hundred feet in a second; and that the currents in the nerves are eight or ten times stronger than those in the muscles. He found that the time required to contract a muscle, together with the time required to relax it again, is not more than the third of a second, and is a constant quantity.

It is difficult to say which is calculated to arouse the higher degree of wonder, the stupendous scale of the mechanism of the solar system, or the consummate perfection with which it works. If, for example, a small tube, with fine cross-wires at each end, be so placed that some familiar fixed star can be seen through it exactly in a line with the crossing of both wires, and the tube be then left in its exact position, it will begin to sweep away from the star in consequence of the earth's revolving movement. But, after twenty-three hours, fifty-six minutes, and four seconds, the tube will be restored to its former position, and the star will again appear exactly in a line with the crossings of the wires. This time is, therefore, called the *sidereal day*, or the day with reference to the stars.

A small privateer of forty or fifty men, having on board some hives made of earthenware, full of bees, was pursued by a Turkish galley manned by five hundred seamen and soldiers. As soon as the latter came alongside, the crew of the privateer mounted the rigging with their hives, and hurled them down on the deck of the galley. The Turks, astonished at this novel mode of warfare, and unable to defend themselves from the stings of the enraged bees, became so terrified that they thought of nothing but how to escape their fury; while the crew of the small vessel, defended by masks and gloves, flew upon their enemies, sword in hand, and captured the vessel almost without resistance.

The light from the sun comes to us in two ways—direct, and by reflection from the atmosphere; and the chemical rays from the sun come also in this twofold way. But the *proportion* of light and chemical force which reach us in this twofold manner is very different. Professor Ruseal found that when the sun had an altitude of twenty degrees, of one hundred rays of visible light, sixty came direct and forty from the light diffused over the sky; but of one hundred chemical rays, only eight came directly from the sun, while ninety-two were reflected from the atmosphere.

The style of Milton's "Paradise Lost" had become so antiquated, so obscure, about a hundred years ago, that a bookseller named Osborne thought proper to publish a prose version of it for the benefit of "ordinary readers."

The movements one makes are generally stimulated through the senses, as when a loud sound makes us start, but they are often spontaneous or determined from within. In awakening from sleep, movement often precedes sensation. Most commonly the first symptom of awakening is a general commotion of the frame, a number of spontaneous movements—the stretching of the limbs, the opening of the eyes, the expansion of the features—to which succeeds the revived sensibility to outward things. No decided facts have ever been adduced to

show that a stimulation of the senses invariably precedes the awakening movements. We are therefore led to believe that the reanimation of the system consists in a rush of nervous power to the moving organs at the same time that the susceptibility of the senses is renewed.—*Bain*.

The metric system of weights and measures has been adopted in Mexico, Chili, Peru, New Granada, Bolivia, Venezuela, and French and Dutch Guiana. It was in evidence before the British House of Commons, in 1862, that, in 1859, of the total trade of Great Britain, including 79,405 vessels, there were 47,398 vessels, or about 60 per cent. of the total number, going to or from countries using the kilogramme.

It is now well known that, in all febrile diseases, the disintegration or combustion of the tissues is greatly increased beyond the healthy standard. To this is to be ascribed the increased temperature which is the symptom of the febrile state and the rapid emaciation. The products of the increased metamorphosis are mainly eliminated by the kidneys. As long as the kidneys are equal to the increased work thrown upon them, the blood is properly depurated, and the typhoid state is worked off. But if the kidneys be unequal to the task, either from the large amount of effete material to be eliminated, from primary disease in the reacting tissue, or from congestion resulting (as it often does) from their increased work, then the blood becomes contaminated, and convulsions or the typhoid state supervenes.—*Dr. Murchison*.

## FACTS FOR THE LADIES.

My WHEELER & WILSON has been in almost daily use, Sabbaths excepted, for over ten years, doing the work, both coarse and fine, for a family which for seven years consisted of more than forty persons. During the whole ten years it has needed no repairs of any kind, and its condition is so good now that I would not exchange it for a new machine. So perfect is its running order that it has not required a second needle in over three years. MRS. WM. A. OBENTON.  
*Union Point, Ga.*

## THE GREAT BOOK ON THE HORSE.

GEO. ROUTLEDGE & SONS,  
416 BROOME ST., NEW YORK,  
Have now ready an entirely new edition of  
**STONEHENGE ON THE HORSE,**  
IN THE STABLE AND THE FIELD:  
His Varieties, Management in Health and Disease, Anatomy, Physiology, etc. Illustrated with nearly 200 Engravings. With the addition of an Appendix on Diseases Indigenous to America, by Alfred Large, M. D. 8vo. Cloth, \$5.

GORDON'S SHORT VOLUNTARIES,  
For the Organ, \$1.50; BELLAK'S NEW METHOD FOR PIANO FORTE, 75 cents; RICHARDSON'S NEW MODERN SCHOOLS FOR PIANO FORTE, \$2.50. Send for Catalogue of New Music Books. S. T. GORDON,

## UNDERGROUND LIFE ; OR, COAL-MINES AND MINERS.

IT has been very justly asserted that the material prosperity of a country can be ascertained by its richness or poverty in the possession of coal-mines. The chief motive power which does all the physical work, independent of that achieved by the muscles of men and animals, is heat; fuel, therefore, is the most important element

in all of the industries which create the wealth of a people. England, France, and the United States, among the nations of the earth, are preëminently powerful; and it is also true that they possess within their respective boundaries larger amounts of coal, in given places, than can elsewhere be found. It is also a remarkable fact that this mineral fuel is most abundantly diffused over the temperate regions of the northern hemisphere, as if the nations who are now the most civilized had naturally settled around beds of coal, that most powerful agent of civilization and progress.

The English people ascribe their great commercial prosperity to their coal-mines; they significantly term them their "Black Indies." An eloquent writer, speaking on the subject, remarks: "On one occasion three hundred vessels, all coal-laden, were seen making deep into the waters, and weighed down with the mineral burden of far more worth to us (England) than auriferous sands or Mexican mines."

What is true of England must be true of the United States; and it is, therefore, with just pride that we read, in a general review of mineral wealth made by M. Simonin (in a recent exhaustive work on mining, published in Paris, and reprinted in London and New York), that "*The coal-fields of the United States are the largest in the*

*world, extending from the foot of the Alleghany Mountains, on both sides of the chain, but especially on the western side, as far as the Missouri and the Arkansas, reappearing at the base of the Rocky Mountains.*"

The area of the American coal-formation is asserted to be eight times larger than that of all other known coal-deposits. The coal-fields of the United States have been worked for little more than forty years, but their product already equals the "out-put" of France and Belgium united. The coal-deposits of many of the United States, indeed, cover a fourth, and, in some instances, a third, of their entire area. In these vast and probably exhaustless mines exists the great reserve for future ages. The coal in America mainly lies in fields, or near the surface, while in Europe it is mostly in mines, deep under ground. The following account applies more especially to the mines and miners of France, Belgium, and England.

Like most mineral substances, the history of coal is largely combined with fable. The Greeks and Romans were probably acquainted with the fossil fuel. Aristotle's favorite pupil, Theophrastus, in his treatise on stones, does not omit to speak of coal being found in Liguria

and Elis. The ancients, however, made little or no use of this combustible; probably they did not know the proper way to burn it. The forests, in those early times, afforded ample supplies for all the wants of industry, which was then in its infancy. Possibly some miners who smelted and worked the metals, or some blacksmiths who made and tempered arms, might have made occasional use of it as fuel; but this is exceedingly doubtful. In the houses, wood and charcoal were

Miners going down a Shaft.

the only fuel; and, as the polished people of those ages inhabited countries favored by Heaven, such as Italy, Greece, Egypt, and Asia Minor, where severe cold is of rare occurrence, they warmed themselves in the sunshine during the winter, even while discussing public affairs in the forum. Perhaps it may also be allowable to suppose that the mean temperature of the air was, in those days, slightly in excess of that of the present day. However this may be, the laws of heat were unknown to the ancients; the presence of vapor was not even suspected, and all mechanical force was solely derived from the muscles of living beings.

When the wind-bags of Æolus were empty, convicts rowed the galleys; when the absence of a stream of water would not allow a bad water-wheel being put up, animals, and even men, turned the mill.

The working of coal-mines on a large scale is really a modern invention, and originated in England. As late as 1306, Edward I. issued a proclamation forbidding the English people to use coal. Toward the close of the thirteenth century, mention is made of the coal-mines of Scotland and Wales. In the seventeenth century the British coal-mines were in full operation, and then gave employment to four thousand ships that carried coal to France, Germany, and Holland. At the close of the reign of King James I. of England (1620), after numerous failures, the manufacture of iron by the use of coal was established; and from this period may be dated that activity in coal-mining which has distinguished modern times. England obtaining the supremacy, Belgium, and then France, followed.

The importance of coal-mines is only measured by the quantities

Geometers and Surveyors of the Mine in Consultation.

We read on the walls of Pompeii, beneath a caricature representing an ass in a mill, this line:

"Work away, little donkey, as I have worked, and you will profit by it."

Thus, amongst the ancients, there was little need of coal, either for industrial purposes or in common life. We see with what indifference the masters of the world passed by mineral fuel, when we find that the aqueduct of Fréjus passed through the middle of a coal formation; and that, in the Lyonnaise, the aqueduct that carried water to the beloved capital of Claudius traverses the carboniferous formation; one of the subterranean branches is even cut through the coal, yet nobody troubled his head about this substance. The people and senate of Rome evidently know nothing of the value of coal.

The Chinese, to whom all great discoveries, except that of America, have been rightly or wrongly accorded by some persons, were acquainted with mineral fuel from a very remote period. They knew how to work it, they even collected the inflammable gases which exude from coal, and used them for purposes of illumination. They have, however, throughout all their history, worked their mines in a very slovenly manner, making no supports for underground ways, no provisions against the inroads of water, or the dangers arising from the explosions of fire-damp and other inflammable gases.

produced, and, from this point of view, coal-mines are affairs of yesterday; it may be said that the date of working them on a large scale marks the date of their origin, and also opens one of the brightest pages recording human progress.

The important fact was not in the discovery of the coal itself, but in its application on a large scale, like that of the present day, to the manufacture of iron and all other metals, and to the heating of steam-bollors, whether fixed, locomotive, river, or engine. It is of no import to the modern to know that the ancients were acquainted with coal, as they did not know how to use it. The true history, therefore, of coal, dates from the eighteenth century, and may be said to be connected with and form part of the history of modern civilization. The steam-engine was invented among the coal-mines; it was needed to pump water from the coal-pits; that necessity met, it was used to raise coal from the mines. Coal is a heavy, bulky article, selling at a low price. It is not enough to tear it from the bowels of the earth; it must be transported economically often to considerable distances. What makes transportation difficult and costly is the state of the roads. To remedy the evils of soft earth sinking under the pressure of heavy bodies, wooden tracks were devised, over which wheels rolled easily; these were applied to underground ways, then extended over the surface—then the wooden rail gave way to iron. Then followed

discoveries that made coal an efficient agent to raise steam in boilers, and from that time the railway and the locomotive, born of the necessities of working coal, were complete.

Coal-mines profited the earliest, and to the greatest extent, by these magnificent applications. Already the locomotive carries the indispensable mineral afar, and at so small a cost as to seem almost incredible. This low cost of carriage has everywhere facilitated the distribution of the supply of coal. Ships and railways carry it to countries which do not possess the mineral, and ordinary roads are placed under contribution when the distances are not too great; hence the demand for the fuel has exceeded all bounds. For the last half century the mines have doubled their production in England, France, and Belgium, every fifteen years; in the United States, every four years.

The natural causes which combine to create the vast coal-deposits, necessarily place them far down in the bowels of the earth; and it therefore requires the most untiring energy, lavish expenditure of money, and physical endurance, to bring the coal where it will be practically useful for the wants of man. It is, therefore, to be expected, in the course of years, with the inducements held out to succeed, that mining should become a vast interest, and that the inventions and ways resorted to, to get at the coal, and bring it to the surface of the earth, would be as novel and startling as the object pursued is useful and grand.

At the start, two kinds of underground work are always required by coal-miners: first, the *shaft*, which is the perpendicular opening that descends from the surface of the earth down to the coal-deposit; second, the *levels*, which are the winding streets, if you please, that are opened in the mine by the progress of excavation. The coal-bed having been discovered, and its extent ascertained, if it is decided to "work it," the preliminary steps of opening are commenced.

When the earth's surface over the coal-bed is composed of lime or sand-stone, the progress is slow and wearisome—sometimes the rocks to be penetrated blunt the tools—in this case the walls of the descending shaft support themselves.

When the ground is soft and fragile, the shaft is walled either by brick, stone, or timber, which linings are now in large mines constructed according to the strictest rules of art. Sometimes the shaft goes through a water-bearing strata, and then the difficulties are unusually great, for the walls have to be protected with a lining that

will not only keep out the water, but bear the enormous pressure of it from the outside. The cost of making these shafts is often enormous: on a single one in Durham, England, was expended a half million of dollars. M. Simonin makes mention of a shaft over one thousand six hundred feet deep—and which is really a magnificent work of art—which, if it had been built from the surface of the earth upward, would make a tower five times higher than St. Paul's, Lon-

don, and three times higher than the dome of St. Peter's, at Rome.

The same obstacles to be overcome in constructing a shaft are to be met with in opening the *levels*, they are sometimes even more difficult in construction, for in them advantage cannot always be taken of circular or elliptical forms, to resist the pressure without; the con-

sequence is, that the levels often crush and crumble, filling themselves with earth, rocks, and, what is more terrible, floods of water. The cost, of the levels is, therefore, but little less expensive than the shafts, and their amount of cost in the aggregate, is much larger, for they often, in one mine, reach the united length of four or five miles. The water-levels, used for draining the mines, frequently grow into huge canals and artificial rivers, some of which are used to trans-

port boat-loads of coal from one locality of the mine to another.

The commencement of the opening of a coal-mine is always interesting. In Catholic countries, in Belgium especially, after the shaft has been opened a few yards, its top is crowned with flowers, and the attendant priest invokes the blessing of Heaven on the enterprise, which, if successful, will give employment to so many people. In course of time, a mine, if it is rich, becomes a large village under ground. It has its streets, its water-courses in the form of canals and rivers, its restaurants, taverns, residences, stables, and workshops. The place is laid off with mathematical care by experienced surveyors. In some collieries there is a person especially appointed, who is charged with those responsible duties; he is called the *geometer* or *surveyor of the mine*: he has his instrument-bearer, his chain-carrier, and other necessary assistants. He makes his underground examinations with care, and brings them to completion in the mining-office above-ground.

A visit to a coal-mine is always extremely interesting and exciting to a novice. The underground workings are of course reached by the shaft. In descending, there is an unpleasant sensation of vacancy;

the bucket which holds you rubs against the walls; the space is narrow, and appears more so on account of the darkness. The water filters through the surrounding rock, drop by drop, making things damp and unwholesome. Now and then it occurs to you that a stone might fall from the wall, and break your head; that the rope, stretched by the weight

it supports, the oscillations of which are perceptible, may also break, or the bottom of the tub may fall out. Then there may be a collision, and possible entanglement with the ascending bucket; but you finally reach your journey's end. Visitors most frequently refuse to descend the shaft in this rude way; some cower down in the bottom of the bucket, where they remain motionless through fear, and it is sometimes actually necessary to turn the bucket over to get these stupefied

Longitudinal View of a Timbered Level.

Walled Level.

Potters or Trolley-boys, in England, formerly.

people out, and they often recover their senses with difficulty. The miners, on the contrary, make this journey twice every day without thought of danger, laughing, and talking, and cracking their jokes as they go down. When the miners arrive at the bottom of the shaft they separate in the gloom, each going to his place of work with all the ease that characterizes people who move about in daylight.

Under the protection of an experienced person you start on your visit, and enter wonderingly the subterranean labyrinth. The lights are dim, but you soon become accustomed to the gloom, and begin to perceive objects. You first notice men begrimed with soot, and get the smell of gunpowder; here the miners are blasting, and getting coal. In the levels the "rolley-boys" are crowded together, and you gradually get the sight of long trains of coal-wagons going and coming, the lamps only for a moment lighting up the faces of the drivers, and showing the forms of the wagons. As you proceed, you find the galleries from which the coal is taken intersecting each other, like the streets of a town; there are cross-roads and squares, each one named, and giving its direction. Some of the galleries, which are long and wide, are well ventilated from the principal thoroughfares and great streets, and constituting, if you please, the aristocratic quarter of the mine; other galleries are low and tortuous, full of bad air, and

out of repair. This underground town you find full of inhabitants, who seem to be as contented, and as much at home, as if they were living in sunshine, and working in the green fields. You finally discover that you are walking beside railways used by horses and coal-cars, that you cross large streams by handsome bridges, that you see canals and fountains; and, by more minute observation, you perceive that there are even plants and living creatures peculiar to the mines.

As horses are much used in mines, it is interesting to note how their superior intelligence and fidelity to man develop themselves in these subterranean regions, where they are excluded from the light of day. They are always greatly alarmed at the sight of the mouth of the shaft, which alarm is increased when they are bound with ropes, or forced into a cage used for lowering them into the mine. When thus treated, they are so paralyzed that they make no resistance; being to all appearance overcome with fear, they often seem, in their descent, to be absolutely dead; but when they reach the bottom of the pit they slowly recover their senses and good-nature. Their instinctive ability to look for good footing comes in play in these dark regions of their new home, and they soon become acquainted (even though they cannot read the signs) with the streets and their directions, and learn all the side-passages, corners, and dangerous places. It is truly interesting

to see how careful these faithful creatures are not to run against the coal-trains at the "turn-offs," and stopping-places, and how soon they learn the right distance from the air-ways at which they ought to stop, to clear the lungs of foul vapor, and snatch a moment's respite from labor.

The horses are well cared for by their owners, and are great favorites with the miners, and in time they become fat and glossy, and seem, on the whole, absolutely to prefer the equable and warm atmosphere of the mine, to great roads varied by wind and rain, sunshine and frost. Rats follow the luxury of oats, and the hiding-places of the hay kept in the mines, and often become great nuisances; they seem to thrive in parts of the mine that would destroy human beings. On one occasion a miner pursued a rat with a lighted candle, and in his excitement passed beyond the line of vitalized air: the consequence was an explosion that killed himself, and wounded many other persons. Bats also find their way into the mines, and are thus more comfortably provided for than where they are annoyed by daylight. It yet remains for the naturalist to illustrate, describe, and classify the animal and vegetable life peculiar to these underground worlds created by man's industry in the acquirement of coal.

A mode of discipline is adopted among the miners, who are sent up and down the shafts in cages or "guides." A certain number go down in the morning and come up at night, to make way for others who compose the "night set" of men. On the following week the "night shift" relieves the day crew of the week before, except in the case of the "packers" and "stowers" away of "gib" or waste. They work only at night and sleep by day, paraphrasing the story of the Belgian miner, who can say—

"My lamp is my sun, and all my days are nights."

Descent of a Horse down a Mine-Shaft.

The mouth of a coal-shaft is always animated, as the work is carried on in the open air and by daylight. The tubs filled with coal have, by the aid of powerful steam-machinery erected at the mouth of the mine, rapidly ascended. These tubs are, with surprising promptness, emptied by ingenious ways, some having a movable bottom of the shaft, or turned over by mechanical means. Now, in the bottom of the shaft, the work is performed in reverse order—that is to say, the tubs are loaded and started upward without the loss of a moment. At a given signal, the engine-man, who is on the alert, turns on the steam, the ropes glide on the pulleys, the full tubs coming up, and the empty ones going down. The engine-man is governed by an index, which informs him when the tubs will pass each other in the shaft, and he avoids the possibility of even casual collision by moderating his speed when the ascending and descending tubs meet. This point passed, every thing moves rapidly again. It is thus, by good management and promptitude, coupled with rapidity and the power of the enormous engines, that, in many instances, such immense quantities of coal are drawn from a single pit—from six to eight hundred tons per day in France and Belgium, and a thousand tons per day in England.

We have only now been informed of the beginning of the struggle. It has been hinted at how great the expenditure of capital and labor a mine involves; it must now be our painful duty to allude to the cost of human life, and show how much sacrifice is sometimes required to produce a piece of coal for every-day use. It is not without reason that the art of mining borrows some of its terms from the art of war; that in France a year's work is called a campaign, the underground working-places posts, a gang of miners a brigade or squadron—in England a crew or shift—while in Cornwall the underground manager is called a captain, and the store-keeper a purser. Is it not said that they attack the coal, and is not the mine itself the colliers' field of battle? Is it not there that, in his struggles against all dangers, he may be said to combat them foot to foot? The four elements of the ancients—earth, air, fire, and water—all conspire against him.

Fire menaces him in blasting, in the firing of the coal, and in explosions of fire-damp; the air, by becoming rarefied, or mixed with mephitic or explosive vapors; the earth, in falls of roofs, etc.; the water, by inundations. The collier opposes to all these (often invisible) enemies, the calm stoicism, the approved courage, and the practical science which tend to make the brave and skilled miner. And the underground soldier is the more meritorious, in that he is encouraged neither by the certainty of advancement, nor by the hope of honorable recompense, in this contest in which he risks his life at every moment. He has only the satisfaction of observing discipline, and of faithfully doing his duty.

Fire is perhaps the most terrible enemy the collier has to encounter, and it is in the firing of shots in blasting that he is to guard most carefully against its attacks.

Collision of Tubs in a Shaft.

A stall, when blasting is being carried on, always offers a splendid sight. In order to lose as little time as possible, all the shots are fired together. At a signal given by the leading man, a light is applied to the match, and all retire as fast as they can. The shots go off at close intervals: the air is driven afar; the masses give way, and are shattered; fragments of rock are blown here and there, and the noise of the explosion is reëchoed throughout the mine. It is a regular cannonade. A thick white smoke, with a nauseous smell, deleterious gases resulting from the combustion of sulphur, charcoal, and saltpetre, fill the level, and are slowly dissipated. Then the men soon return to their work, and sound the rock with a hammer, in order to judge of the effects produced by the explosion.

When a shot does not go off, it is only after the utmost precautions have been taken, and a proper delay, that the miner ought to approach. There are instances of shots having gone off ten minutes after being lighted. Numerous and dreadful accidents have arisen in consequence of too great a haste on the part of the miner in his anx-

Inundation of a Mine.

iety to return to his post, to untamp the hole. In many districts this is not allowed; then new holes have to be made.

Accidents from blasting arise, also, from other causes: instead of using cartridges, the powder is merely poured into the bottom of the hole, under the pretext that it will act more powerfully. It is scattered over the sides, and, in working the tamping-bar or the needle, a spark may be produced by the friction of the iron against silicious substances, precisely as in the impact of steel. The spark is then communicated to the powder, and the charge explodes in the face of the miner, who is blinded or disfigured, if not killed on the spot.

It is always at the bottom of the shafts that the firing of powder is attended with danger. The men can only escape to the surface after the charge is lighted, and it is necessary that they should be raised with all speed—at any rate, to a certain height. The horses working in the mines understand the signal that precedes an explosion, as, at the first sound of the bell, the intelligent animals start off at full speed.

Men mutually engaged in dangerous work become greatly attached to each other, and instances of heroic devotion are frequently occurring among the miners.

"In a certain Cornish mine (South Caradon) two miners, deep down in the shaft, were engaged in putting in a shot for blasting: they had completed their affair, and were about to give the signal for being hoisted up; one at a time was all their coadjutor at the top could manage, and the second was to kindle the match, and then mount with all speed. Now, it chanced, while they were both still below, one of them thought the match too long; tried to break it shorter; took a couple of stones, a flat and a sharp, to cut it shorter; did cut it of the due length, but, horrible to relate, kindled it at the same time, and both were still below! Both shouted vehemently to the coadjutor at the windlass, both sprang at the basket; the windlassman could not move it with them both. Here was a moment for poor miner Verran and miner Roberts! Instant horrible death hangs over both, when Verran generously resigns himself: 'Go aloft, Roberts,' and sits down; 'away, in one minute I shall be in heaven!' Roberts

bounds aloft, the explosion instantly follows, bruises his face as he looks over; he is safe above-ground: and poor Verran? Descending eagerly, they find Michael Verran too, as if by miracle, buried under rocks which had arched themselves over them, and little injured; he too is brought up safe, and all ends joyfully."

L. Simonin quotes the above incident from Carlyle's *Life of John Sterling*, and the additional fact that Verran was anxious after this to work above-ground, and also to gain a little schooling; a few hearty admirers of his heroic act were glad to subscribe a little sum to enable him to spend some months at school. Here he acquired the great arts of reading and writing, then established himself in a farm and married a schoolmistress, with whom he and his affairs prospered as they deserved.

One of the most melancholy catastrophes that can overwhelm the miner is the falling in of the roofs and wallings that support the various levels of the mine, and woe to the unfortunate who is involved in the catastrophe! The interruptions of water from old workings are perhaps to be most apprehended.

One of the most fatal cases of inundation took place at Heaton Colliery, near Newcastle, on the 3d of May, 1815, owing to a failure in exploring through a fault, where the ordinary thickness of coal between the workings of the colliery and the inundated wastes of the adjoining Old Heaton had been reduced till it gave way under the extreme pressure. A dreadful inundation was the consequence, which immersed ninety human beings in the upper part of the workings, from which there was no possibility of relief. Some miraculous escapes were made by some of the persons who happened to be close to the shaft, but the place where the water burst in being many hundred yards distant, and forming a descending plane of one in ten, the tremendous force of the current bore down every obstacle, and hurled, in the most awful confusion, men, horses, carriages, and all that stood in its way toward the shaft, where some fortunate beings escaped when the water was nearly breast high. Many months elapsed before the waters were sufficiently drained to render the workings again accessible. On the 19th of February, in the following

year, fifty-four bodies were brought to the surface, and were all recognized, with one exception, principally by their clothes. Twenty-nine were buried at Wallsend, and the mournful procession filled the road for a mile in length.

The bodies of these poor people were without smell, but so perfect and clay-like that, upon pressing the flesh, the indentation remained. No opinion can be formed whether they had suffered much bodily pain; but their mental agonies must have been of the most maddening description, since no earthly hope could be entertained that it was in the power of their fellow-men to afford them any succor.

Subterranean fires only trouble the miners by the mephitic vapors which they give out, and the high temperature they create in the stalls. But it is otherwise with fires caused by the explosive gas of coal-mines—that combination of hydrogen and carbon, that brother of illuminating gas.

No meteor, however terrible its imagined splendor, can be compared to an explosion of fire-damp. Let one of those scourges of Heaven be imagined, which appear sometimes as if designed for the punishment of human beings—a thunderbolt, a hurricane, a cyclone, or a whirlwind—burning, overthrowing, destroying every thing in their course, and the effects produced by them will still be inferior to those caused by an explosion of mine-gas. A discharge of cannon loaded with canister-shot, and fired point-blank into a crowd; a powder-magazine taking fire in the midst of a body of workmen; a gasometer exploding in a factory—can scarcely give an idea of an explosion of fire-damp suddenly overtaking the miner.

The moment the mixed gas comes in contact with the flame of a lamp, a tremendous explosion takes place, resulting from the combination of the components of the fire-damp, hydrogen and carbon, with the oxygen of the air. The two former separate to combine with the oxygen, with which they have the greatest affinity. The double phenomenon only takes place at a high temperature; without flame it would not arise. The reaction produces an effect like the most brilliant lightning, and makes itself heard by a clap of thunder. The explosion spreads instantly into all the galleries of the mine; a roaring whirlwind of flaming air destroys every thing it encounters, over-

throwing trams, barricades, and trap-doors, mounts into the shaft, and lifts from their foundations the staging which covers its mouth, through which it discharges thick clouds of coal, stone, and timber.

The men are blinded, thrown down, scorched, and sometimes burnt to a cinder; often their clothes take fire, and not unfrequently they are buried beneath the ruins of the fallen roofs. When an attempt is made to fly to their assistance, there is not time to rescue them; there are only corpses left which are scarcely recognizable. The calamity spares nobody, even though as many as one or two hundred miners may be at work; death extends over the whole of the mine where the explosive gas was present.

The air-doors are thrown down, the ventilation of the mine is reversed, the underground atmosphere is vitiated by the combustion of the fire-damp, and the stalls are filled with steam and carbonic acid. Sometimes the temperature rises so much that the coal is converted into coke at the sides of the galleries, and the commotion is so great that the dams have to withstand both fire and water, and the wallings, raised for the purpose of resisting the thrust of the measures, are themselves overthrown. Then to a scene of already indescribable desolation are added the horrors of inundation, falls of the ground, and fire, where the explosion has already made only too many victims.

To take at random an example of these heart-rending accidents, we will notice that of the mine of Méons, near Saint-Étienne. The over-man and three other men went down into the mine, where they found the stable-men looking after the horses, and the carpenters at their work. Suddenly a frightful report was heard. The masonry surrounding the mouth of the shaft, made of large, dressed stones, the framework supporting the pulleys, were all blown to a distance of even more than a hundred yards from the opening. The very tubs and the ropes were lifted from the bottom of the mine by the devastating hurricane, and hurled into space. The superintendent arrived, filled with alarm. He thought a boiler had burst, but it was an explosion of fire-damp. An attempt at rescue was promptly organized, but the lamps were extinguished, and, the galleries of the mine being filled with smoke and bad air, the rescuers fell suffocated, and two of them were dead.

Falling in of a Mine.

Explosion in a Coal-Mine.

An ambulance was established at the entrance to the mine, and another descent made. The colliers, when a comrade has to be rescued from danger, will sacrifice themselves to the last man. The search was carried on throughout the night, by feeling, for the lamps would not burn. At ten o'clock the next morning none of the victims had been recovered, and a number of asphyxiated searchers filled the ambulance.

An agitated crowd, consisting of the families of the miners, pressed round the pit-mouth. One woman in particular attracted attention, on account of the deep sorrow she displayed; she was young and beautiful; she carried a babe at her bosom, and large tears fell from her eyes. She is the wife of the over-man. She requested, as a special favor, to be allowed to enter the mine in order to recover her husband; but no woman being permitted to go into the workings, she anxiously waited outside.

Now they returned into the interior. The wrecks of the timberings and the coal which had been blown down formed a desolating sight. From time to time blocks of coal were still heard to fall, as they became detached from the walls. The carpenters, who were repairing the timbering, had been crushed. All the horses (of which there were six) were found suffocated in the stable, and the groom dead with them, lying in the manger, apparently asleep; the hay had been set on fire and was still burning. At length one of the men, who went down with the over-man, was discovered, and alive! Blown by the explosion to the bottom of a gallery, he had been horribly scorched and nearly blinded. His escape was cut off by falls of coal and rock, and, as he had no light, he durst not move. Hearing no noise for fifteen hours, and despairing of ever beholding the light of day again, he awaited death with resignation, consoling himself with the thought (to make use of his own words) "that his wife and children would be supported by the benefit-club of the mine." After this first rescue, another man was found, almost burned in the rubbish, but still alive. He said he had seen a *river of fire* pass over him, and, to save himself, he placed his hand over his eyes. They were frightfully injured, and he was blind.

This memorable catastrophe long inspired the miners of the country where it occurred with a sort of superstitious terror. They no longer went to work without their safety-lamps, and without first imploring divine protection, and commending themselves to Saint Barbe, the miners' patron saint, whose statue was solemnly erected at the mouth of the gallery.

Modern mechanical inventions of great size and power, known as air-pumps, worked by steam-engines of the largest size, are used to ventilate the mines. Not only is pure air supplied by these immense machines, but all the irrespirable gases are got rid of which accumulate in them, and which form distinct layers in the galleries. The carbonic acid, being the heaviest, is at the bottom; if a dog were carried into it, the animal would fall dead from suffocation. The lamp of the miner would also be extinguished by coming in contact with it. Then comes the middle layer, which is composed more or less of pure air, and, lastly, occupying the higher levels, is the light carburetted hydrogen, the inflammable gas which, when mixed with air, forms the terrible fire-damp, the effects of which we have attempted to describe. Sometimes all these gases are intermingled; it is then that explosions and suffocations are especially to be apprehended. Good ventilation, either by natural or artificial means, and the use of safety-lamps, are the only means by which accidents from explosions of fire-damp can be avoided.

On entering a mine where the air is bad, the lights gradually grow pale, and are finally extinguished. A sort of pressure on the temples is felt, a faintness, a sense of extreme lassitude and fatigue in the limbs, the action of the heart fails, and suffocation approaches. The lights now either cease to burn in the foul air, or become, on the slightest motion, extinguished; a better place must be obtained without delay, and instant retreat becomes necessary. With what delight a fresher and purer air is breathed! that which was just left being, in the language of the miners, *dead*. The successful lighting of a match is now hailed with joy, and, less inquisitive than Lot's wife, the delighted miners flee from threatening danger, without looking once behind.

Entered, according to Act of Congress, in the year 1869, by D. APPLETON & CO., in the Clerk's Office of the District Court of the United States for the Southern District of New York.

## BOOK II.—THE ORK AT SEA.

### I.—THE OUTER LAWS.

THE snow-storm is one of the unknown quantities of the sea. It is the most obscure of meteors, obscure in every sense of the word; a mixture of fog and tempest, a phenomenon not yet well explained. This uncertainty causes many disasters.

Men try to explain every thing by the wind and the current. Now, there is in the air a force which is not wind, and in the water a force which is not current. This force, the same in the air as in the water, is effluvium. The air and the water are two masses of liquid, nearly identical, and changing mutually into each other by condensation and dilatation, so much so, that breathing is a species of drinking; the effluvium alone is fluid. The wind and the current are only impulses, the effluvium is a steady stream. The wind is visible in its clouds, the current in its foam; the effluvium is invisible. Yet from time to time it says, *There I am*, and its way of saying so is a thunder-clap.

The snow-storm presents a problem analogous to that of the dry fog. If an explanation of the Spaniard's *callina*, and the Ethiopian's *quobar*, be possible, this explanation will certainly be made by attentive observation of the magnetic effluvium.

Without the effluvium, a host of facts remain enigmatic. The altered velocity of the wind, changing in a storm from three feet to two hundred and twenty feet a second, may possibly cause the alteration of the waves, rising from three inches in a calm, to thirty-six feet in a stormy sea; the horizontalness of the blasts, even in a squall, may possibly make us understand how a wave thirty feet high can be fifteen hundred feet long; but why the waves of the Pacific are four times higher near America than near Asia, that is to say, higher at the west than at the east; why it is the contrary in the Atlantic; why, under the Equator, it is the middle of the sea which is highest; why these ocean swells change their place: this is what the magnetic effluvium, combined with the rotation of the earth and the attraction of the heavenly bodies, can alone explain.

Does it not require this mysterious complication to understand an oscillation of the wind, going, for instance, by the west,

from southeast to northeast, then returning abruptly by the same great round, from northeast to southeast, so as to make, in thirty-six hours, the prodigious circuit of five hundred and sixty degrees, which was the course run over by the snow-storm of March 17, 1867?

The storm-waves of Australia reach eighty feet in height; Australia is near the pole. A tempest in our latitudes is due less to the disturbance of the winds, than to continuous electric submarine discharges; in 1866, the transatlantic cable was regularly impeded in its working two hours out of the twenty-four, from noon till two P. M., by a sort of intermittent fever. Certain compositions and decompositions of forces cause phenomena, and thrust themselves on the sailors' calculations, under pain of shipwreck. The day when navigation, now a routine, shall become a mathematical science; the day, for instance, when men will try to find out why, in our climate, hot winds sometimes come from the north, and cold ones from the south; the day when we shall understand that the diminutions of temperature are proportioned to the depths of the sea; the day when we shall have before our minds the fact that the globe is a great magnet polarized in space, having two axes, one of rotation, one of effluvium, cutting each other at the centre of the earth, and that the magnetic poles revolve round the geographic; when those who risk their lives shall choose to risk them scientifically; when the unstable medium of navigation shall have been studied; when every captain shall be a meteorologist, every pilot a chemist—then will many catastrophes be avoided. The sea is as much magnetic as watery; an ocean of forces floats, unknown, in the ocean of currents; down-stream, we may say. To see in the ocean only a mass of water is not to see it at all; the ocean is a coming and going of fluid as much as a flux and reflux of liquid, affected even more by attraction than by hurricanes. Molecular adhesion (shown by capillary attraction, among other phenomena) shares, in the ocean, the grandeur of the ocean's volume, and the waves of effluvium sometimes assist, sometimes oppose, the waves of the air and the water. He who knows not the electric laws knows not the hydraulic, for they interpenetrate. True, no study is more difficult or more doubtful; it borders on imposture, as astronomy borders on astrology. But without it there is no real navigation.

This said, let us pass on.

The snow-storm is one of the most dangerous compounds of the sea. It is above all magnetic. The pole produces it, as it produces the aurora borealis, inspiring the fog of the one and the gleam of the other; the effluvium is perceptible in the snow-flake as well as in the striated flame.

\* Entered, according to Act of Congress, in the year 1869, by D. APPLETON & CO., in the Clerk's Office of the District Court of the United States for the Southern District of New York.

Tempests are the nervous attacks and fits of madness to which the sea is subject. The sea has its sick-headaches. Storms may be compared to sicknesses; some are mortal, others not; you may escape from this one, and not from that. The whirlwind of snow passes for being usually fatal. Jarabija, one of Magellan's pilots, styled it "a cloud that came from the bad side of the devil."\*

The old Spanish sailors called this kind of whirlwind *La Nevada* when it snowed, and *La Helada* when it hailed. According to them, bats fell from the sky in the snow.

Snow-storms belong to the polar latitudes. But sometimes they slip, one might almost say crumble, there is so much ruin in these aerial incidents, as far down as our climes.

We have seen that the *Matutina*, in leaving Portland, entered on a great nocturnal risk, aggravated by an approaching storm. She had confronted all these threats with a sort of tragic audacity. Nevertheless, let us not forget it, she had had her warning.

## II.

### FILLING UP THE ORIGINAL PROFILES.

As long as the ork was in Portland gulf, there was little sea; the waves were almost still. However dark the ocean, it was still light in the sky. The ork hugged as closely as possible the cliff which was a good screen for it.

There were ten persons on board the little Biscayan felucca, three of the crew, and seven passengers, two of these, women. By the light of the open sea (for extent illumines twilight) all the figures were now clearly brought out. Besides, they were no longer hiding, no longer embarrassed; each resumed his liberty of motion, uttered his cry, showed his face; their departure was a deliverance.

The motley nature of the group was strikingly apparent. The women were of no age; a wandering life cuts youth short, and poverty is a wrinkle of itself. One was a Basque of the dry-ports, the other, the woman with the large rosary, Irish. They had the careless air of poor devils. On entering, they had crouched down together on some boxes at the foot of the mast. They conversed; Irish and Basque, as we have said, are kindred tongues. The Basque woman's hair smelled of onions and basil. The master of the ork was a Guipuscoan Basque; one sailor was a Basque of the north slope of the Pyrenees, the other a Basque of the south slope, that is to say, of the same nation, though nominally the former was a Frenchman and the latter a Spaniard. The Basques do not recognize the official division. *Mi madre se llama montana*, "My mother's name is mountain," said the muleteer Zalarens. Of the five men accompanying the two women, one was a Frenchman of Languedoc, one a Frenchman of Provence, one from Genoa, one, the old fellow who had the hat without a pipe-hole, seemed to be a German, the fifth, their leader, was a Basque from the moors of Biscarossa. It was he who, at the moment when the child was going to enter the ork, had kicked the foot-bridge into the sea. This man, stout, fidgetty, quick in his movements, covered, it will be remembered, with embroideries, spangles, and tinsel that made his rags shine, could not keep in one place, stooped, rose again, went and came unceasingly from one end of the craft to the other, as if distracted between what he had just done and what was going to happen.

This leader of the band, and the master of the ork and the two men of the crew, all four Basques, spoke now Basque, now Spanish, and then again French, all these tongues prevailing on the two slopes of the Pyrenees. The others, except the woman, spoke something like French, which was the staple of their slang. At this time the French tongue was beginning to be chosen by the nations as a medium between the preponderance of consonants at the North and the preponderance of vowels at the South. Business men in Europe talked

French; so did thieves. It may be remembered that the London robber, Gibby, understood Cartouche.

The ork was a good sailer and went at a good rate; nevertheless, ten persons with their baggage made a heavy cargo for so small a craft.

This saving of a troop by the vessel did not necessarily imply the affiliation of the crew with the troop. It sufficed that the master of the vessel was a *Vascongado*, and the leader of the band another. With this race, mutual assistance is a duty admitting no exception. A Basque, we have just said, is neither French nor Spanish, he is Basque, and bound to save another Basque, always and everywhere. Such is the brotherhood of the Pyrenees.

All the time that the ork was in the gulf, the sky, though it had an awkward look, was not angry enough to disturb the fugitives or occupy their attention. They were running away, they were escaping, they were brutally gay. One laughed, another sang. The laugh was dry but unrestrained, the song low but careless.

The Languedocian cried, *Caucagno!* "Cockaigne" expresses the height of satisfaction in Narbonne. He was a half-sailor, native of the maritime village of Gruissan, on the south slope, a sea-going man rather than a seaman, but clever in handling the scows of the pond at Bages, and drawing up on the dark sands of Saint Lucia the drag-net full of fish. He was one of that race who wear red caps, make complicated signs of the cross, Spanish fashion, drink wine from goat-skins, squeeze the sack, scrape the ham-bone, kneel down to swear, and invoke their patron saints with a threat: Great Saint, grant me what I ask, or I'll throw a stone at your head, "ou té feg' un pic." He might, at need, be a useful addition to the crew.

The Provençal, in the galley, was making up a turf-fire under an iron pot, and cooking the soup.

This soup was a sort of *puchero*, in which fish replaced the meat, and the Provençal kept throwing into it small peas, little square bits of salt pork, and cloves of red pepper, concessions made by the bouillabaisse eater to the ollapodrida eaters. By his side was one of the provision-bags, unpacked. Over his head he had lighted an iron lantern with talc sides, that swung from the galley ceiling. Alongside it was suspended, on another hook, the kingfisher weathercock. It was then a popular belief that a dead kingfisher, hung up by the beak, always turned his breast to windward.

While he went on making the soup, the Provençal occasionally put the stem of a gourd to his mouth and swallowed a mouthful of brandy. It was one of those wicker-covered gourds, broad and flat, with handles, which were hung from the side by a strap and then called "hip-gourds." Between each swallow he mumbled a couplet of one of those country songs the subject of which is just nothing; a hollow road, a hedge; you see in the meadow, through an opening in the thicket, the lengthened shadow of a horse and cart in the setting sun, and from time to time the end of the fork loaded with hay appears and disappears above the hedge. No more is required to make a song.

A departure relieves or overwhelms, according to what is on the heart or the brain. All seemed relieved except one, who was the patriarch of the band, the man with the pipeless hat.

This old man, who seemed German more than any thing else, although he had one of those faces in the depths of which nationality is lost, was bald, and so grave that his baldness seemed a tonsure. Every time he passed before the Virgin at the bow, he lifted his felt hat, disclosing the swollen veins of his aged head. A sort of large cloak, of brown Dorchester serge, worn and torn, in which he was wrapped, only half hid his body coat, light, narrow, and hooked up to the collar like a cassock. His two hands were always coming together, joining mechanically, as if accustomed to prayer. He had what might be called a white look, for looks are above all a reflec-

\* *Una nube saleida del mala lado del diablo.*

tion of the mind, and it is an error to suppose that ideas have no color.

This look was evidently the surface of a strange interior, result of a medley of contradictions, tending some to good, others to evil. To an observing mind it was the revelation of an imperfect humanity, which might fall below the tiger or rise above the man. Such chaotic souls exist. There was something in this face that could not be deciphered, a very essence of secrecy. This man had evidently known the calculating foretaste and the blank after-taste of guilt. On his impassiveness, perhaps only apparent, were imprinted the signs of two ossifications, that of the heart, belonging to the executioner, and that of the mind, belonging to the mandarin. One might affirm (for monstrosities have their way of being perfect) that every thing was possible to him, even an emotion. Every learned man has a little of the corpse in him; this man was learned. Only by looking at him, you might detect the philosopher in the movements of his body and the folds of his cloak. His was a fossil face, yet the wrinkled, polyglottic mobility, which degenerates into grimace, marred its seriousness. Still it was severe; no hypocrisy, but no cynicism. The man was a tragic dreamer, whom crime had left pensive. He had a bandit's eyebrows softened by an archbishop's eyes. His scanty gray hairs were white on the temples. You perceived in him the Christian modified by Turkish fatalism. Chalk-stones deformed his skeleton fingers; he was ridiculously tall, but had good sea-legs. He walked slowly on the deck, with an air of sombre conviction, looking at no one. The gleam of his eyeballs, fixed yet vague, revealed a soul that watched the gloom, without escaping the pricks of conscience.

From time to time the leader of the band, abrupt and alert, zigzagging swiftly through the vessel, came to whisper in his ear. The old man replied by a nod. It was like the lightning consulting the night.

### III.

#### UNQUIET MEN ON AN UNQUIET SEA.

Two persons in the vessel, the old man and the master of the ork (who must not be confounded with the leader of the troop), were entirely occupied, the master with the sea, the old man with the sky. The eyes of the one never quitted the waves, the other kept watching the clouds. The behavior of the water caused the captain's anxiety; the old man seemed to suspect the heavens. He watched the stars through every opening in the clouds.

It was the moment when it is still light, and a few stars begin to twinkle feebly in the evening sky.

The horizon had a singular aspect, with different sorts of mist.

The fog was chiefly over the land, the clouds mostly over the sea.

Even before emerging from Portland bay, the master, anxious about the sea, had gone through a long series of manœuvres. He did not wait till he had rounded the point. He examined the braces, satisfied himself that the stays of the lower shrouds were in good order, and held taut the futtock-shrouds, precautions which showed the daring of a man bent on speed.

The defect of the ork was that it drew more water forward than aft.

The master moved every moment from the sailing to the variation compass, sighting all the objects along the coast, for the purpose of finding to what point of the card they corresponded. A breeze on the bowline first showed itself; he did not seem vexed at this, though it varied five points from their course. Most of the time he held the tiller himself, as if he could only trust himself to lose no momentum, the effects of the rudder being commensurate with the rapidity of headway.

The difference between the true and the apparent rhumb being greater in proportion as the vessel has more speed, the

ork seemed to make more way to windward than she really did. She was not going very close to the wind; but to know the true rhumb accurately you must go before the wind. If we see in the clouds long streaks, ending in the same point of the horizon, that point is the source of the wind; but that evening there were several winds, and the point of the rhumb was doubtful, so that the master mistrusted these illusory indications.

He steered cautiously, yet boldly, braced up to the wind, kept sharp watch for sudden shifts, would not let the vessel come up in the wind, noted the lee-way, observed little jerks of the tiller, had an eye on all the incidents of the vessel's motion, all the variations of their headway, kept constantly, for fear of accidents, some points clear of the land that he was coasting, above all, made the angle of the vane with the keel larger than the angle of the sails, the wind-line indicated by the compass being always doubtful, owing to the small size of the instrument. His eyes, immovably cast down, examined every change of the deep.

Once, however, he lifted them into space, and tried to see the three stars in Orion's belt; these stars are called the Three Magi, and an old proverb of the old Spanish pilots says: "He who sees the Three Magi is not far from the Saviour."

This glance of the master toward heaven coincided with a grumbling aside of the old man at the other end of the vessel.

— We cannot even see the *Claire des Gardes* or Antares, red as he is. Not a star is distinct.

No anxiety among the other fugitives.

Nevertheless, when the first joy of escape was over, they could not help perceiving that they were at sea in the month of January, and that the gale was icy cold. Impossible to stow themselves in the cabin, much too narrow, and, moreover, encumbered with baggage and bales. The baggage belonged to the passengers, the bales to the crew, for the ork was not a pleasure-vessel, she was a smuggler. The passengers had to establish themselves on deck; such wanderers were easily resigned to it. Out-door habits simplify the night arrangements of vagabonds; the open air is their friend; the cold helps them to sleep, sometimes to die.

The Languedocian and the Genoese, while waiting for supper, rolled themselves up near the women at the foot of the mast, on tarpaulins, which the sailors threw to them.

The bald old man stood in the bow, immovable and seemingly insensible to the cold.

The master of the ork uttered, from the tiller where he stood, a sort of guttural summons not unlike the cry of the bird called in America the Exclaimer; at this interjection, the leader of the troop and the master thus apostrophized him: *Etchecho jauna*. These two Basque words, which mean "laborer of the mountain," are, among these antique Cantabrians, a solemn formula for entering on business.

Then the master pointed out the old man to the leader with his finger, and the dialogue continued in Spanish, not entirely correct, as it was mountain-Spanish:

*Etchecho jauna, que es est hombre? \**

\* Laborer of the mountain, who is this man?

A man.

What tongue speaks he?

All.

What things knows he?

All.

What country?

None and all.

What God?

God.

How do you call him?

The madman.

How do you say you call him?

The sage.

What is he in your band?

He is what he is.

The chief?

No.

What then is he?

The soul.

Un hombre.  
 Que lenguas habla?  
 Todas.  
 Que cosas sabe?  
 Todas.  
 Qual pais?  
 Ningun y todas.  
 Qual Dios?  
 Dios.  
 Como le llamas?  
 El Tonto.  
 Como dices que le llamas?  
 El Sabio.  
 En vuestra tropa que esta?  
 Esta lo que esta.  
 El gefe?  
 No.  
 Pues que esta?  
 La alma.

The leader and the master separated, each returning to his own train of ideas, and soon after the *Matutina* issued from the gulf. The great undulations of the open sea began.

Where the ocean was free from foam it had a sticky appearance; the waves, losing their sharp edges in the twilight, looked like puddles of gall. Here and there a flattened billow showed cracks and stars, like a window at which stones had been thrown. At the centre of these stars, in eddying apertures, trembled a phosphorescence which recalled the cat-like after-gleam of departed light in the screech-owl's eyes.

Proudly and like a stout swimmer, the *Matutina* crossed the dangerous vibration of Chambers bank. Chambers bank, a hidden obstacle at the entrance of Portland roads, is not a bar, but an amphitheatre. A circus of sand under water, benches carved by the rolling waves, an arena round and symmetrical, round as the Jungfrau, but submerged, an ocean Coliseum of which the diver has glimpses in the moments of his plunge—such is Chambers bank. Hydras fight there, leviathans meet there; there, say the legends, at the bottom of the gigantic funnel, lie the carcasses of ships seized and sunk by the huge spider-kraken, called also the mountain-fish. Such is this frightful ghoul of the sea.

These spectral realities, unknown by man, show themselves at the surface by a slight shiver.

In the nineteenth century, Chambers bank is a ruin. The breakwater recently constructed has upset and cut down, by the surf it causes, this lofty specimen of submarine architecture, just as the pier built at Croisic, in 1760, altered by a quarter of an hour the tidal computation there. Yet the tide is eternal; but eternity obeys man more than is commonly supposed.

#### IV.

A CLOUD, DIFFERENT FROM THE OTHERS, COMES UPON THE SCENE.

THE old man, whom the leader of the band had at first called a madman, and then a sage, did not leave the bow any more. Since passing over the Chambers bank, his attention had been divided between the sky and the sea. He lowered his eyes; then he raised them. What he looked at most closely was the northeast.

The master gave up the tiller to a seaman, strode over the hatch of the cable-tier, traversed the gangway, and came upon the fore-castle.

He made up to the old man, but not fronting him. He kept himself a little in his rear, with elbows stuck into his hips, hands spread out, head bent down upon his shoulder, eye opened, eyebrow elevated, a corner of the lips smiling—which is the bearing of curiosity, when it vacillates between irony and respect.

The old man—it may be that he was in the habit of talking sometimes when alone; it may be that feeling some one behind

him induced him to speak—began to talk to himself as he scanned the distance.

—The meridian, whence one reckons the true ascension, is marked in this age by four stars, the Polar, Cassiopea's chair, Andromeda's head, and the star Algenib that is in Pegasus. But no one of these is visible.

These words succeeded each other involuntarily, confused, scarcely spoken out, and as though he had nothing to do with pronouncing them. They floated out of his mouth, and were lost. The monologue is the smoke of the mind's internal fires.

The master broke in:

—Seignior!

The old man, perhaps a little deaf as well as very pensive, continued:

—Not enough stars and too much wind. The wind always leaves its course, to throw itself upon the coast. It flings itself there perpendicularly. This is because the land is warmer than the sea. Its air is lighter. The cold and heavy sea-wind precipitates itself on the land, to take its place. This is why, in the open sky, the wind blows toward the land from all sides. It would be important to make lengthened tacks between the estimated and the presumed parallels. When the latitude by observation does not differ from the presumed latitude more than three minutes in ten leagues, and four in twenty, one is on a fair course.

The master bowed, but the old man did not notice him. This personage, who wore what resembled a university gown of Oxford or Gottingen, did not budge from his haughty or stubborn attitude. He looked upon the sea, as a connoisseur of the waters and of men. He studied the waves, but almost as though he were about to seek in their tumult for the turn of his words, and to impart something to them. There was in him a touch of the pedagogue and of the seer. He had the air of a pedant of the abyss.

He pursued his soliloquy, uttered perhaps, after all, to be listened to.

—One might struggle on, if there were a wheel instead of a tiller. At the rate of four leagues an hour, thirty pounds of weight upon the wheel can produce three hundred thousand pounds of effect upon the direction. And more still, for there are occasions when one can make two additional turns.

The master bowed a second time, and said:

—Seignior. . . .

The old man's eye fixed itself upon him. The head turned, without the body moving.

—Call me doctor.

—Seignior doctor, it is I who am the captain.

—So be it! replied the doctor.

The doctor—we shall call him thus henceforward—appeared willing to talk.

—Have you an English octant?

—No.

—Without an English octant, you cannot take an altitude at either end.

—The Basques, replied the master, took soundings before there were any Englishmen.

—Don't trust to springing your luff.

—I ease away when necessary.

—Have you measured the vessel's speed?

—Yes.

—When?

—Just now.

—By what means?

—By means of the log.

—Were you careful in keeping your eye upon the reel?

—Yes.

—Does the sand-glass make exactly its thirty seconds?

—Yes.

—Are you sure that the sand has not worn the aperture between the two globes?

— Yes.

— Have you tested the sand-glass by the vibration of a musket-ball suspended to a spun-yarn drawn from above the soaked hemp?

— Certainly.

— Did you wax the spun-yarn, for fear that it might stretch?

— Yes.

— Have you made a counterproof of the log?

— I have made a counterproof of the sand-glass by the musket-ball, and a counterproof of the log by the cannon-ball.

— What diameter had your ball?

— A foot.

— Good weight?

— It is an old cannon-ball of our old war-ork, the *Casse de Par-grand*.

— That was in the Armada?

— Yes.

— And that carried six hundred soldiers, fifty seamen, and twenty-five guns?

— The wreck knows all that.

— How have you estimated the force of the water acting against the ball?

— By means of a German steelyard.

— Have you made allowance for the impulsion of the wave against the cord to which the ball is attached?

— Yes.

— With what result?

— The force of the water was a hundred and seventy pounds.

— That is to say that the vessel makes four French leagues an hour.

— And three Dutch leagues.

— But that is only the surplus of the speed of the wake over the speed of the vessel.

— Assuredly.

— Where are you steering?

— For a creek that I am acquainted with, between Loyola and St. Sebastian.

— Put yourself as quickly as you can on the parallel of the place to which you are bound.

— Yes. The least possible falling off.

— Mistrust the winds and the currents. The former provoke the latter.

— The traitors!

— No abuse! The sea can hear. Insult nothing. Be satisfied with watching.

— I have watched, and I do watch. The tide is at present against the wind; but soon, when it will run with the wind, we shall have an improvement.

— Have you got a set of charts?

— No; not for these waters.

— Then you grope your way as you navigate?

— No; I have the compass.

— The compass is one eye; the book of charts is the other.

— A man, blind of one eye, sees.

— How do you measure the angle that the vessel's course makes with the keel?

— I have my compass of variation, and then I guess.

— Guessing is well; knowing is better.

— Columbus guessed.

— When there is a constant shifting, and when the card in the compass-box turns about balefully, one knows no longer what to do with the wind, and the end of it is having no estimated point, and no corrected one. An ass that knows his way is worth more than a diviner with his oracle.

— There is none of this shifting in the northeaster yet; and I see no ground for alarm.

— Ships are flies in the spider-web of the sea.

— For the moment all is well enough in sea and wind.

— A tremor of black points upon the flood; such is man upon the ocean.

— I do not look forward to any thing bad for to-night.

— There may come such inky darkness, that you will be troubled to get out of the mess.

— So far, all goes well.

The doctor's eye fixed itself upon the northeast.

The master continued:

— Let us only get into the Bay of Biscay, and I answer for every thing. Ah! yes, indeed, I am at home there. I have it fast, my Bay of Biscay! It is a hand-basin often in a terrible fume; but I know all its depths of water, and all the nature of its bottom: mud before San Cipriano, shell before Cizarque, sand off Cape Penas, small pebbles at Boucaut de Mimizan; and I can distinguish the color of all the pebbles.

The master stopped; the doctor was no longer listening.

The doctor was looking steadily at the northeast. Something more than ordinary passed across that icy visage. All the terror conceivable upon a mask of stone was there depicted. His mouth dropped out this expression:

— Well and good!

The pupil of his eye, become all at once that of the owl, and quite round, dilated with stupefaction, as he seemed to probe a point in the distance.

He added:

— It is right. For my part, I am willing.

The master looked at him.

The doctor resumed, speaking to himself, or to some one in the void:

— I say yes.

He was silent; opened his eyes wider and wider, redoubling his attention to what he saw; then continued:

— It comes from a long way off; but what it will do, nobody knows but itself.

The segment of space, whereinto the eye and the thought of the doctor were plunged, being opposite the west, was illuminated by the ample reflection of twilight, almost as by day. This segment, very circumscribed and surrounded by patches of grayish vapor, was entirely blue; but the blue was leaden, not azure.

The doctor, turned altogether to the side of the sea, and without looking further at the captain, pointed out with his forefinger this airy segment, and said:

— Do you see that?

— What?

— That.

— What?

— Away there.

— The blue? Yes.

— What is it?

— A bit of sky.

— For those who are going to heaven, said the doctor. For those who are going elsewhere, it is something else.

And he emphasized these enigmatical words with a fearful look, lost in the obscurity.

There was silence.

The master, reverting to the double estimate put upon this man by the leader, debated within himself this question: Is he a madman? Is he a sage?

The doctor's bony and rigid forefinger remained at point, as though fixed there, toward the blue and overcast bit of the horizon.

The master examined this blue.

— In fact, muttered he to himself, it is not sky; it is cloud.

— Blue cloud worse than black cloud, said the doctor; and he added:

— It is the cloud of the snow.

— *La nube de la nieve*, said the master, as if he sought to understand the phrase better by translating it to himself.

— Do you know what the cloud of the snow is? asked the doctor.

— No.

— You will know before long.

The master betook himself again to studying the horizon. All the while that he was observing the cloud, the master spoke between his teeth.

— A month of squalls, a month of rain, January coughing, and February crying; that's the whole winter for us Asturians. Our rain is warm. We have snow only in the mountains. Ay, indeed, look out for the avalanche! The avalanche knows nothing whatever. The avalanche is a beast.

— And the whirlwind of snow is a monster, said the doctor.

The doctor, after a pause, added:

— Look, here it comes!

He resumed:

— Several winds are setting themselves to work at the same time; a hard wind from the west, and a slow-blowing wind from the east.

— That one is a hypocrite, said the master.

The blue cloud grew bigger.

— If the snow, continued the doctor, is formidable when it descends from the mountain, judge what it is when it hurls itself down from the pole.

His eye was glassy. The cloud seemed to be increasing upon his countenance, as it was upon the horizon.

He went on, as though in a reverie:

— Every minute brings on the hour. The will from on high is revealing itself.

The master again put this question to himself internally: Is he a madman?

— Captain, asked the doctor, his eye all the time fixed upon the cloud, have you navigated much in the Channel?

The master answered:

— To-day is the first time.

The doctor, who was absorbed in the blue cloud, and who, as a sponge can only hold so much water and no more, could only feel a certain amount of anxiety, was not moved by this reply of the master, beyond a very slight shrugging of his shoulders.

— How so?

— Seignior doctor, my voyages are generally to Ireland. I sail from Fontarabia to Black Harbor, or to Akill Island, which is two islands. I go sometimes to Bractipult, which is a point in Wales. But I steer always above the Scilly Islands. I am not acquainted with this sea.

— That is serious. Unfortunate he, who spells out the ocean. The Channel is a sea that must be read off-hand. The Channel—it is the sphinx. Beware of its bottom.

— We are in twenty-five fathoms here.

— You must get into the fifty-five fathoms that are to the westward, and keep clear of the twenty that are to the eastward.

— We will sound as we go.

— The Channel is not a sea like any other. The rise and fall is fifty feet at spring, and twenty-five at neap-tides. High-water flood is not low-water ebb. Ah! you look as though you were disconcerted.

— To-night we will sound.

— For sounding, you must lay-to; and you will not be able.

— Why?

— On account of the wind.

— We will try.

— The hurricane is a sword in the reins.

— We will sound, Seignior doctor.

— You will not be able even to bring-to.

— Trust in God.

— Prudence in words! Pronounce not lightly the irritable name.

— I shall sound, I tell you.

— Be diffident. You are soon going to be cuffed by the wind.

— I mean that I shall try to sound.

— The rush of the water will prevent the lead from going down, and the line will break. Ah! this is your first visit to these latitudes?

— The first.

— Well, in that case, listen, captain!

The accentuation of this word, "listen," was so imperative, that the master bowed.

— Seignior doctor, I am listening.

— Haul on board your larboard sheets, and stand off to starboard.

— What do you mean?

— Stand to the west!

— Caramba!

— Stand to the west!

— Not possible.

— As you please. What I tell you is for the others. For myself, I accept.

— But, Seignior doctor, standing in to the west. . .

— Yes, captain.

— Is the wind in one's teeth.

— Yes, captain.

— Is the devil's own pitching.

— Choose other words! Yes, captain.

— It is the vessel on the rack.

— Yes, captain.

— It is, perhaps, the mast carried away.

— Perhaps.

— You want me to steer to the west?

— Yes.

— I cannot.

— In that case, battle it out with the sea as you please.

— It would be necessary to have a change of wind.

— It will not change, all night.

— Why?

— This is a blast twelve hundred leagues long.

— Beat against this wind? Impossible.

— Steer westward, I tell you.

— I will try. But, in spite of every thing, we shall fall to leeward.

— There's the danger.

— The gale drives us to the east.

— Do not go to the east!

— Why?

— Captain, are you aware what for us is the name of death, in these days?

— No.

— Death is called the East.

— I will steer to the west.

The doctor, this time, looked at the master and looked at him with a look that bears hard, as though to drive home an idea into a brain. He had turned entirely round to the master, and he uttered these words slowly, syllable by syllable:

— If, to-night, when we are in midwater, we hear the sound of a bell, the vessel is lost.

The master looked at him, stupefied.

— What do you mean?

The doctor made no reply. His look, one instant gone forth from him, had now reëntered. His eye had again become introspective. He did not seem to take in the master's startled question. He was now only attentive to that which he listened to within himself. His lips articulated, as if mechanically, these few words, low as a murmur:

— The moment is come for black souls to wash themselves.

The master made the expressive wry face, that brings all the lower part of the countenance up toward the nose.

—He is more of madman than of sage, grumbled he.  
And he walked away.  
Nevertheless he laid his course for the west.  
But the wind and the sea were getting up.

## V.

## HARDQUANONNE.

SHAPELESS, in all sorts of swellings, the fog gathered at once upon every point of the horizon, as though invisible mouths were occupied in puffing up the leather bags of the tempest. The form of the clouds became threatening.

The blue cloud held all the lower part of the sky. There was as much of it now in the west, as in the east. It worked up against the gale. These contradictions belong to the law of winds.

The sea, which, a moment before, had scales, now had a skin. Such is this dragon. It was no longer the crocodile; it was the boa. This skin, livid and foul, appeared thick, and wrinkled itself heavily. At the surface, bubbles of spume, isolated and resembling pustules, rounded themselves, then burst. The scum was like leprosy.

It was at this instant that the ork, still visible in the distance to the child left behind, lighted up its signal-light.

A quarter of an hour passed away.

The master cast his eyes about in search of the doctor. He was no longer on deck.

Immediately on the master leaving him, the doctor had stooped his inconvenient height under the companion-way, and had gone into the cabin. There he seated himself near the stove, upon a block. He drew from his pocket a shagreen inkhorn, and a Spanish-leather portfolio. He took out of the portfolio a piece of parchment with four folds, old, spotted, and yellow. He smoothed out the parchment, took a pen from the pen-holder of his inkhorn, laid the portfolio flat upon his knee, and the parchment on the portfolio, and began to write upon the second side of the parchment, making use of the light that came from the cook's lantern. The motion caused by the sea troubled him. The doctor wrote a long time. As he wrote, he remarked the gourd-bottle of aguardiente, that the Provençal tasted each time that he put spice into the lobscouse, as though he consulted it as to the seasoning.

The doctor noticed this gourd, not because it was a bottle of brandy, but on account of a name woven in the wicker-work, in red withes upon the black withes. There was light enough in the cabin to read this name.

Pausing in his work, the doctor spelled it to himself in low tone:

—Hardquanonne.

Then he turned to the cook:

—I had not previously noticed this gourd. Did it belong to Hardquanonne?

—To our poor comrade Hardquanonne? said the cook. Yes.

The doctor went on:

—To Hardquanonne, the Fleming from Flanders?

—Yes.

—Who is in prison?

—Yes.

—In the strong keep at Chatham?

—It is his gourd, replied the cook, and he was my friend. I keep it as a souvenir of him. When shall we see him again? Yes, it was the gourd he carried slung about him.

The doctor took up his pen again, and began, with difficulty, tracing lines, somewhat irregular, upon the parchment. He was evidently taking pains that they should be quite legible. Notwithstanding the trembling of the vessel and his trembling from age, he got to the end of what he wished to write.

It was time, for suddenly there was a shock of a wave; a very heavy sea struck the ork, and that sort of shivering

began to be perceptible, with which vessels welcome the tempest.

The doctor got up, approached the stove, all the while bending his knees adroitly at each abrupt pitch or roll, dried at the fire the lines he had just written, refolded the parchment in the portfolio, and replaced the portfolio and the writing apparatus in his pocket.

The stove was not the least ingenious bit of the ork's furniture down below. It stood well, by itself. Nevertheless, the seething-pot rocked. The Provençal watched it.

—Fish-soup, said he.

—For the fishes, replied the doctor. Then he went again upon deck.

## VI.

## THEY THINK THEY OBTAIN HELP.

In the midst of his increasing preoccupation, he passed as it were under review the circumstances of the case; and any one who had been near him might have heard these words fall from his lips: — Too much rolling, and not enough pitching.

And the doctor, recalled by the dark laboring of his mind, went down again into his thoughts as a miner into his mine.

But this meditating in no way hindered his observation of the sea. Gazing upon the sea is a reverie.

The sombre chastisement of the waters, eternally tormented, was about to begin. A lamenting voice went up out of all this waste. Preparatives, doleful and confused, were being made in immensity. The doctor studied what was under his eye, and lost not one of its details. Otherwise, there was nothing of contemplation in his look. One does not contemplate hell.

A vast commotion, still half latent, though plain enough in the troubled distance, accentuated and aggravated more and more the wind, the mists, the surgings. Nothing is so logical as the ocean, nothing more absurd. This incongruity with itself is inherent in its sovereignty, and is one of the elements of its amplitude. The wave is, without ceasing, for and against. It coils itself up, only to uncoil itself. One of its swashes attacks, another delivers. No sight like that of the billows. How paint those alternated and scarcely actual hollows and reliefs, those valleys, those hammocks, those heavings of the breast, those rough outlines? How express those thickets of foam, made up of mountain and of dream? The indescribable is there, everywhere, in the racking to pieces, in the frowning, in the restlessness, in the perpetual contradiction, in the lights and shadows, in the cradling of the clouds, in the vaulted key-stones forever displaced, in the disintegration without gap and without fracture, and in the funereal din that is made by all this frenzy.

The wind came out due north. It was so favorable in its strength, and so fair for getting away from England, that the master of the *Matutina* decided to crowd her with canvas. The ork broke away in the foam as at a gallop, all sails spread, wind astern, bounding from wave to wave, with rage and glee. The fugitives, enraptured, laughed. They clapped their hands, and applauded the rolling, the waves, the puffs of wind, the sails, the speed, the flight, the future unexplored. The doctor appeared not to see them, and was dreaming.

Every trace of day was eclipsed.

It was at this moment that the child, watching upon the distant cliffs, lost sight of the ork. Up to this time his look had remained fixed, and, as it were, dependent on the vessel. What part had this look in destiny? At the instant when distance blotted out the ork, and when the child no longer saw any thing, he went his way northward, while the ork stood on her course to the south.

All burying themselves in the night.

## VII.

## SACRED HORROR.

On their part, but with opened hearts and joyfulness, those whom the ork was carrying away saw the hostile ground

recede and diminish behind them. Little by little the dark, round outline of the ocean grew higher, obscuring, in the twilight, Portland, Purbeck, Tineham, Kimmeridge, the two Mathavers, the long strips of misty cliff, and the coast marked out with light-houses.

England became obliterated; the fugitives had no longer any thing around them but the sea.

All at once the night was terrible.

There was no more distance or space. The sky was turned into blackness, and shut itself down upon the vessel. Slowly the fall of snow began. Some flakes appeared. One might have thought them souls. Nothing was longer visible on this the race-course of the wind. One felt one's self delivered over. Every thing possible is therein—deception.

It is by this cavernous obscurity that the polar whirlwind of snow makes its début in our clime.

A vast turbid cloud, like the under-body of a hydra, weighed upon the ocean, and in places this livid belly adhered to the waves. Where it adhered, there was the resemblance of pockets full of holes, exhaling vapor, and filling themselves with water. These suction threw up, here and there upon the waves, cones of spume.

The boreal hurricane threw itself upon the ork; the ork flung up its heels therein. The gust and the vessel came together, as though to insult each other.

In the first infuriate onset, not a sail was brailled up, not a jib was lowered, not a reef was taken in—so frenzied was the onward rush. The mast creaked and bent backward as though affrighted.

Cyclones, in our northern hemisphere, work from right and left, like the hands of a watch, with a whirling movement that equals sometimes sixty miles an hour. Though she was entirely at the mercy of this fierce rotatory assault, the ork behaved as though under control, with no other precaution than that of keeping herself upright, and of presenting her head to the first blast, while receiving another on her side, and avoiding another astern. This *quasi* prudence would have served no purpose, in the event of the wind veering suddenly from one quarter to the opposite.

A hollow sound inflated an inaccessible region.

The howling of the abyss—nothing is comparable to this. It is the immense bestial voice of the world. What we call matter—that unfathomable organism, that amalgamation of immeasurable energies wherein one sometimes recognizes an imperceptible amount of horrifying intention, that cosmos blind and nocturnal, that Pan incomprehensible—has a cry, a cry strange, prolonged, obstinate, continued, which is less than the Word and more than thunder. This cry, it is the tempest. Other voices—songs, melodies, clamor, words—issue from nests, from hatchings, from pairings, from marriages, from dwelling-places; this one, the whirlwind, issues from the Nothing which is All. Other voices express the soul of the universe; this one tells of its monster. It is a shapeless howling. It is the inarticulate spoken by the indefinite. Fact, pathetic and full of terror! These noises carry on dialogues above and beyond man. They rise up, are lowered, fluctuate, induce waves of sound, give rise to all sorts of indignant surprises in the mind, now burst forth close to our ears with the importuning of a flourish on trumpets, now have the husky hoarseness of the far-off-disordered hurly-burly that resembles a language, and that is a language in truth; it is the effort that the world itself makes at speaking; it is the stammering of prodigy. In this wailing, confusedly manifests itself all that an enormous sinister palpitation endures, undergoes, suffers, accepts, and rejects; most frequently, this wailing reasons falsely; seems to be an access of chronic malady, is rather a wide-spread epilepsy than a force employed; one imagines one's self assisting at a fall from an epileptic fit into the infinite. At intervals, one has glimpses of the reestablishment of the normal order of things, one knows not what

feeble attempt of chaos to reassert its sway over creation. At intervals, it is a complaint; space laments and justifies itself, somewhat as though the cause of the world were being pleaded. One fancies that the universe is a lawsuit. One listens, one tries to seize the reasons assigned, the tremendous for and against. Such groaning of the shades has the tenacity of a syllogism. Vast trouble for the thought! The cause of existence of mythologies and of polytheisms lies therein. To the fearfulness of these prodigious murmurs are added superhuman profiles, vanishing away as soon as perceived, indistinct Eumenides, breasts of Furies outlined in the clouds, Platonian chimeras partially defined. No horror equals that of these sobs, these laughings, these waverings of hubbub, these questions and these answers undecipherable, these appeals to unknown auxiliaries. Man knows not what to make of himself in the presence of this awful incantation. He cowers under the enigma of these Draconian intonations. What meaning underlies them? What signify they? What do they threaten? Whom do they supplicate? There is, as it were, an unchaining. Vociferations from precipice to precipice, from air to water, from wind to waves, from rain to rock, from zenith to nadir, from stars to foam, the muzzle taken off the abyss: such is this tumult, a complication of evil consciences with one knows not what of mysterious disentanglement.

The loquacity of the night is not less lugubrious than its silence. You feel therein the anger of the unknown.

Night is a presence. Presence of whom?

This mist, mysterious and nocturnal, is the struggling, the fleeting, the crumbling, the baleful. You feel the earth no more; you are sensible of another reality.

In the shadow, infinite and indefinite, there is something or some one, of the living; but what is living there is parcel of our death. After our earthly passage, when this shadow shall be a light for us, the life which is beyond our life will take hold upon us. Awaiting this, it seems to be touching us. Darkness is a pressure. Night is a sort of hand laid upon our soul. At certain hours, hideous and solemn, we feel encroaching upon us that which lies behind the wall of the tomb.

Never is this proximity of the unknown more palpable than in storms at sea. The horrible gains growth therein from the fantastic. The possible interrupter of human actions, the ancient cloud-gatherer, has there at his disposal, for moulding the event at his good pleasure, an inconsistent element, an unlimited incoherence, force diffused without defined intention. This mystery, the tempest, accepts and executes, at every instant, one knows not what changes of will, apparent or real.

Poets in all times have called this the caprice of the waves.

But there is no caprice at all.

Disconcerting occurrences that, in Nature, we call caprice, and, in destiny, chance, are fragments of a law seen imperfectly.

## VIII.

### NIX ET NOX.

WHAT characterizes the snow-whirl is that it is black. The habitual aspect of nature in a storm—earth or sea obscure, the sky wan—is reversed; the heavens are black, the ocean is white. Below, foam; above, darkness. An horizon walled with smoke, a zenith ceiled with crape. The tempest is like the interior of a cathedral hung with mourning. But there are no lights in this cathedral; no St. Elmo fires upon the points of the waves; no sparks; nothing phosphoric; nothing but one immense shadow. The polar cyclone differs from the tropical cyclone in this, that the one sets blazing all the lights, and the other extinguishes them all. The world becomes suddenly a cavern-vault. From this night falls a dust of pale specks, that hesitate between this sky and this sea. These specks, which are flakes of snow, glide, wander, float. It is almost as though the tears upon a winding-sheet should take to life and put themselves in motion. With this sowing a maddened blast commingles. A blackness in crumbs of white, the furious in

the obscure, all the tumult whereof the sepulchre is capable, a tornado under a catafalque—such is the snow-storm.

Beneath, trembles the ocean, masking formidable depths unknown.

In the polar wind, which is electric, the flakes immediately become hail-stones, and the air is filled with projectiles. The water crackles under the grape-shot.

No thunder-claps. The lightning of the Boreal hurricanes is silent. What one says sometimes of a cat—"she spits"—may be said of this lightning. It is the threat of a half-opened jaw, strangely inexorable. The snow-storm is a storm blind and dumb. When it is over, the ships are often blind and the sailors dumb.

To get out of such a gulf is not easy.

It would be a mistake, however, to suppose that shipwreck is absolutely inevitable. The Danish fishermen of Disco and of Balesin, the cruisers after black whales, Hearn going toward Behring's Straits to examine the mouth of the Coppermine River, Hudson, Mackenzie, Vancouver, Ross, Dumont d'Urville, experienced, at the Pole itself, the most inclement snow-storms, and escaped from them.

It was into a tempest of this sort that the ork had entered, under full sail and in triumph. Frenzy against frenzy. When Montgomery, stealing out of Rouen, threw his galley at full speed of oars upon the chain barring the Seine at La Bouille, he had the same hardihood.

The *Matutina* flew. Her laying over under canvas made at times, with the sea, a fearful angle of fifteen degrees; but her good tun-bellied keel stuck to the water as though glued to it. The keel resisted all the pressure of the hurricane. The fire-cage lighted up the bow. The cloud charged to the full with blasts, spreading its tremor over the ocean, narrowed in and preyed upon the water round about the ork more and more. Not a gull, not a cliff-swallow; nothing but the snow. The visible extent of the waves, though small, was frightful.

One saw but three or four, immeasurable.

From time to time a vast flash of lightning, of the color of red copper, appeared behind what was obscurely piled from the horizon to the zenith. This vermilion widening set off the horror of the clouds. The sudden lighting up of the depths, upon which, during a second, stood out the foregrounds of the clouds and the distant summits of the celestial chaos, brought the abyss into perspective. On this fiery background the flakes of snow became black, and they might have been called sombre butterflies flying in a furnace.

The first outburst over, the squall, ever chasing the ork, began to roar in continued bass. This is a phrase in rumbling, a fearful diminution of the hubbub. Nothing so disquieting as this monologue of the tempest. The gloomy recitative resembles a breathing-spell of the mysterious opposing forces, and indicates a sort of watchfulness in the unknown.

The ork continued her headlong course. Her two principal sails fulfilled, above all, a terrific function. The sky and the sea were of ink, with jets of foam leaping higher than the mast. Every moment floods of water traversed the deck like a deluge; and at every lurch, whether to port or starboard, the scupper-holes became so many open mouths revomiting the spume to the sea. The women had taken refuge in the cabin: but the men remained on deck. The blinding snow whirled in eddies; the spittings of the wave-crests were added. All was in a state of fury.

At this moment, the leader of the band, standing up, aft, on the transom, with one hand holding on to the shrouds, and with the other pulling off his cotton cap that he shook in the glimmer of the fire-cage, arrogant, happy, his face puffed with pride, intoxicated by all this gloom, cried out:

—We are free!

—Free! free! free! repeated those who had escaped.

And all the band, clutching the rigging, stood up on the deck.

—Hurrah! cried the chief.

And the band howled in the tempest:

—Hurrah!

At the instant when this clamor was drowned in the squalls, a voice, loud and solemn, was heard from the other end of the vessel. It said: Silence!

All the heads were turned to it.

They had recognized the voice of the doctor. The darkness was thick. The doctor was leaning his back against the mast, with which his lean figure was blended; they did not see him.

The voice went on:

—Hark!

All were hushed.

Then was heard distinctly in the gloom the tolling of a bell.

## ORSO'S VENDETTA.

A LEGEND OF CORSICA.

### I.

LEST any one his day forget  
And fail in due devotion,  
The Saint of Monte d'Olmo set  
His bells in merriest motion.  
They called the folk, on every side,  
From slanting fields and orchards wide,  
And dells of dropping streams, that hide  
In dimples of the height,  
Far up, and out of sight.

### II.

From cork-tree wood and pastures brown  
The herdsmen heard the warning;  
And girls, that sought the lofty town,  
Made bright the summer morning  
With gold and red of holiday trim,  
Flashing athwart the olives dim,  
As, light of heart and lithe of limb,  
They climbed the rugged crest  
Where the gray old houses rest.

### III.

Along the paths glad murmurs ran,  
That grew to shouts at meeting—  
The ringing music Corsican,  
In jest and joyous greeting:  
Yet some among them, shy to claim  
The festal joy, unwilling came,  
With lowering brows and eyes aflame,  
That chid, with threatening speech,  
The silent tongues of each.

### IV.

Vincentis these, Grimaldis those—  
Both leaders well attended:  
A hundred years by birthright foes,  
The holy day suspended  
Their right of murder, and compelled  
A show of peace in hate unquelled:  
For, hand on gun, each man rebelled,  
And inly cursed, to see  
His foe's immunity.

### V.

Pietro led Grimaldi's clan:  
Vincenti's chief was Orso,  
The handsomest and bravest man  
From Borgo to Cape Corso.  
He bore a thoughtless galliard's part,  
Quick-blooded, rash, and light of heart,  
Who smiled to see Pietro smart  
With graver sense of wrong,  
Fed, nursed, and hugged so long.

## VI.

The people thronged the little square,  
And heard the sacred pleading  
Through open church-doors—bell and prayer,  
And music, interceding  
To lift their ignorance from sin ;  
When—from the stillness burst a din  
Drowning the *gloria* within—  
A fierce, tumultuous rout,  
With trampling rush and shout.

## VII.

How came the feud ? Some thrust, or word,  
Or whispered imprecation,  
Where itching hands a blow preferred—  
Some precedence of station—  
A little spark, no matter what,  
Dropped into the mine, already hot ;  
And Orso, the holy place forgot,  
Hard-pressed and stung by blows,  
Fired right among his foes.

## VIII.

Pietro's son, Antonio, fell,  
And "Dead !" they cried around him :  
The father burst, with rageful yell,  
Restraining arms that bound him.  
Though still the service breathed and burned,  
The holy place to hell was turned,  
And prayer and bell and chanting spurned,  
While the Grimaldi pack  
Stormed upon Orso's track !

## IX.

He, springing down the winding street,  
Already gained the gateway,  
When, lo ! a band of foes, more fleet,  
His flight confronted straightway.  
No space for thought : he chose the act,  
And, ere Grimaldi's men attacked,  
Sprang through a door : their muskets cracked,  
But he, behind the wall,  
Defied them, one and all.

## X.

While Orso door and window barred,  
The mansion fortifying,  
Pietro, pale and breathing hard,  
Came up and saw it, crying :  
" O spite of hell ! Is Orso there ?  
Must I, then, give the whelp a lair ?  
And shall the house, I built so fair,  
Vincenti's fortress be ?  
Perish the house and he ! "

## XI.

Therewith he fetched a blazing brand,  
While silent stood the foemen,  
And on his roof with frantic hand  
He flung the deathful omen.  
And then a shriek arose—a cry  
Of horror and of agony,  
As the distracted wife came nigh,  
With bloodless lip and cheek,  
And tongue that strove to speak.

## XII.

" Hold ! hold !—our girl ! " at last she said :  
" Our little maiden sleeping—  
Hold ! or her blood is on thy head ! "—  
Then shuddering fell, and weeping.  
Pietro answered, stern and slow :  
" The girl may burn, my goods may go,  
So Orso's ashes lie below !

I close my line in peace,  
If but Vincenti's cease."

## XIII.

Then silence fell upon the day,  
Save of the sparks that kindled.  
With clasping hands that did not pray,  
As hope of succor dwindled,  
Pietro stood, and watched the flame :  
The hostile clans, through horror tame,  
Gave way : the priest between them came,  
That unction might be given  
To those who died unshriven.

## XIV.

The glad and limber arms of fire  
Waved from the walls, and after  
Shot from the roof in roaring spire,  
Till crashed each blazing rafter.  
It spread and grew, devouring fast ;  
And when the roof-tree crumbled last,  
Pietro's mood of madness passed,  
And, sinking in his place,  
He knelt and hid his face.

## XV.

And where was Orso ? When the breath  
Of flame, increasing ever,  
Sent through his soul the thought of death,  
He made one last endeavor :  
And, wildly driven from room to room,  
He found, asleep in curtained gloom,  
The maiden, innocent of doom—  
A gentle, pure-browed thing,  
And in her tenth sweet spring.

## XVI.

Then, suddenly, in Orso's heart,  
Awoke and spake the Tempter :  
" Not yet foredoomed to death thou art ;  
But she—wherefore exempt her ?  
In *her* his race shall disappear ! "  
And then the maid sprang up in fear,  
That hideous roar and crash to hear,  
And see that face of dread  
Bending above her bed !

## XVII.

" Mother ! " she cried ; but Orso now  
Stooped down and softly kissed her,  
And said, contrition on his brow :  
" Nay, fear not, little sister ! "  
Then in his arms, through smoke and roar,  
All tenderly the maid he bore,  
Groping and staggering over the floor,  
Beneath the ceiling's glare  
And down the fiery stair.

## XVIII.

In stony silence Pietro knelt,  
Beside him, prone, the mother.  
None there might guess what either felt :  
They stood, and faced each other,  
Vincentis and Grimaldis, bound  
In awful dread, the people round,  
The priest in the midst—when, hark ! a sound  
Louder than trumps and drums,  
Of " Orso ! Orso comes ! "

## XIX.

Pietro shrank, as from a blow ;  
His trembling wife awaited  
As through the darkness of her woe  
Some light had penetrated :  
And Orso came, O God of grace !

The maiden in his strong embrace;  
The wounds of fire on breast and face,  
With bloody shoulders bare,  
And singed and shrivelled hair.

## XX.

Serene in pain, and proud, was he,  
In old Vincenti fashion:  
The mother fell and clasped his knee,  
O'ercome with grateful passion;  
And caught the maiden to her breast  
And felt her limbs, and, crying, pressed  
The lovely head, and could not rest,  
But thanks and blessings poured  
Upon her child restored.

## XXI.

The father came where Orso stood,  
As though a power impelled him,—  
Made him forget the hate of blood,  
The fury that had held him.  
He tried to speak, but tried in vain;  
Then cowered to earth, and there had lain,  
But Orso lifted him again,  
And whispered: "Say no more—  
Our long vendetta 's o'er!"

## XXII.

Pietro kissed upon the cheek  
And flung his arms round Orso;  
And cried, when tears would let him speak:  
"From Corte to Cape Corso  
Proclaim our long vendetta o'er!  
Never shall seek Grimaldi more  
Vincenti's blood! Even as I swore  
Him hate, I swear him love!  
God hears me from above!"

## XXIII.

That power came o'er the clansmen round:  
Their old mistrust abated,  
And hands to hands their swift way found,  
That ne'er before were mated.  
And peace was born in holiest form:  
The people's joy was like a storm,  
And, while all hearts were throbbing warm,  
Came one, who smiled and said:  
"Antonio is not dead!"

## XXIV.

Then Monte d'Olmo's Saint again  
Bestowed his festal blessing:  
Before the altar knelt the twain,  
Forgiving and confessing.  
That day from memory dare not fade!  
If, afterward, the little maid  
Of Orso was no more afraid,—  
Nay, took Vincenti's name,—  
What heart the maid could blame?

BAYARD TAYLOR.

## A NEW FIELD OF ADVENTURE.

THE Eastern Archipelago is almost a new field of adventure and exploration for the traveller. While the secrets of interior Africa have been wrested from their fastnesses, the Nile traced to its source, and all the dangers and difficulties of travel in those inhospitable wildernesses boldly combated by many travellers, we find the numerous islands of the Asiatic Archipelago to have been singularly neglected by both English and American explorers. The jealousy of the Dutch Government has doubtless been one cause of this—probably the sole cause; for we cannot suppose that Livingstone, or Barth, or Burton, who ran such tremendous risks in Africa, could have been de-

tered from penetrating these islands by the cannibals, the fierce head-hunters, the tropical fevers, or the other dangers incident to the country. We find but two English books on these islands; one that of Sir Stamford Raffles, published in 1820, chiefly treating of Java; and the other by Sir John Crawfurd, published in 1825, who did not visit the eastern part of the archipelago and the interior of Sumatra. Recently an American, Professor Bickmore, of Madison University, has travelled through the entire region known as the Malay Archipelago, making his way through dangerous tribes, penetrating islands hitherto entirely unexplored, and travelling over a larger portion of the archipelago than had ever been accomplished before, either by an Englishman, Dutchman, German, Spaniard, or native. He journeyed from Batavia in Java, along the north coast of that island to Samarang and Surabaya; thence to Macassar; thence through Sapi Strait to the southern end of Timur; thence along the west coast to Dilli, and north to the Banda Islands, ascending their famous volcano, and thence to Amboina. He passed several months in the Moluccas; visited Ceram and Buru; proceeded to Padang, making a long journey through the interior of this island to the land of the cannibals; and from Padang came down to Bencoolen, and made his way across the whole island of Sumatra, through the mountains and down the rivers, to the island of Banca. Professor Bickmore was enabled to accomplish this task by means of the friendly aid of the Dutch officials, secured by credentials from Senator Sumner, as chairman of the Senate Committee on Foreign Relations, and by letters from J. G. S. Van Breda, Secretary of the Society of Sciences in Holland, to Baron Sloet van de Beele, Governor-General of the Netherlands India.

Without referring particularly to all the islands and tribes visited by Professor Bickmore, a few passages from his book may be quoted with interest. The island of Nusalaut is one of a group called the "Uliassers." It is oblong in form, less than two miles in length, and, in some places, only half a mile wide. The surface is hilly, but with no great elevation. The number of villages is only seven. Arriving at Sila, the professor found his fame had travelled before him:

"As we entered the kampong, we found the main street ornamented in a most tasteful manner. The young, light-yellow leaves of the cocoa-nut palm had been split in two and were bent into bows or arcs with the midrib uppermost, and the leaflets hanging beneath. These bows were placed on the top of the fence, so as to form a continued series of arches; a simple arrangement that certainly produced a most charming effect. As we passed along, scores of heavily-loaded flintlocks were discharged in our honor, and these mimic warriors continued their peculiar evolutions. From Sila a short walk brought us to Lainitu, and here our reception took a new phase. In front of the rajah's house was a wide triumphal arch, made of boards, and ornamented with two furious red lions, who held up a shield containing a welcome to the Resident. But just before we passed under that, the crowd in front parted, and lo, before us stood eighteen or twenty young girls, who had been selected from the whole village for their beauty. They were all arrayed in their costliest dresses, which consisted of a bright-red sarong and a low kabaya, over which was another of lace, the latter bespangled with many thin pieces of silver. Their long, black hair was combed backward, and fastened in a knot behind, and in this were stuck many long flexible silver pins, that rapidly vibrated as they danced. Most of them had a narrow strip of the hair over the forehead clipped short, but not shaven, a most unsightly custom, and perhaps originally designed to make their foreheads higher. Their lips were stained to a dull brick-red from constantly indulging in the use of the betel. They were arranged in two rows, and their dance, the *minari*, was nothing more than slowly twisting their body to the right and left, and, at the same time, moving the extended arms and open hands in circles in opposite directions. The only motion of their naked feet was to change the weight of the body from the heel to the toe, and *vice versa*. During the dance they sang a low, plaintive song, which was accompanied by a *tifa*, and a number of small gongs, suspended by means of a cord in a framework of *gaba-gaba*, the dried midribs of palm-leaves.

"While we were watching the slow, graceful dance, dinner was pre-

pared, and we were summoned from the veranda to an open room in the rear. The wife of the rajah was the only lady at the table, and, as all the princes and notables of the other villages were present, the number of guests who were ready to take seats with us was not small. Our bill of fare was sufficient to satisfy the most fastidious epicure; for substantial diet the neighboring forests had furnished us with an abundance of venison and the meat of the wild boar, and the adjoining bays had yielded several kinds of nice fish. All was prepared in an unexceptionable manner, and the rich display of pineapples, mangostins, dukus, and several kinds of bananas, was finer than many a European prince could set before his guests. The process of demolishing had fully begun, when the dark beauties, who had been dancing before the house, came in, and ranged themselves round the table. My first impression was, that they had come in to see how Europeans eat, and I only refrained from hinting to that effect to the Resident on my right, because he had already smiled to see my surprise at our novel reception, and besides, I was anxious not to appear to be wholly ignorant of their odd customs. Soon they began to sing, and this, I thought to myself, is probably what is meant by a sumptuous banquet in the East, and, if so, it well deserves the name. As the song continued, one after another took out a handkerchief of spotless white, and, folding it into a triangular form, began to fan the gentleman in front of her. This is indeed Eastern luxury, I said to myself, and, while I was wondering what would come next, the damsel behind the Resident reached forward and gave him a loud kiss on his cheek. "That was intended as an appetizer, I presume?" *Natuurlijk*, "Of course," he replied, and I leaned back in my chair to give way to a hearty laugh, which I had been trying for a long time to restrain, when suddenly I was astonished by a similar salutation on the lips! It was done so quickly that I had no time to recover from my bewildering surprise, and coolly explain that such was not the custom in my land.

Instead of my laughing at the Resident's expense, the whole party laughed at mine; but my confusion was dispelled by the assurance of all that even the governor-general himself had to submit to such treatment when he came to inspect these islands."

The Battas are a tribe of cannibals living in the interior of the island of Padang. Singular enough, these people are so far civilized as to have invented an alphabet, and yet their fondness for human flesh is unconquerable. Many tribes within the territory under the control of the Dutch Government were at one time cannibals, but the Dutch compelled them to relinquish

their fiendish custom. The tribes in the interior mountain districts have been too inaccessible to the Dutch arms to secure this result. They give an odd origin of this habit. Many years ago one of their rajahs committed a great crime, and it was evident to all that, exalted as he was, he ought to suffer the penalty, but no one would take upon himself the responsibility of punishing a prince. In this dilemma the idea was hit upon that he should be put to death, but that each one should eat a piece of his body, and in this way all share in punishing him. The morsels thus distributed, to the astonishment of all, proved so exceedingly palatable, that it was unanimously agreed there-

after to feast themselves upon convicts, prisoners, and all persons legally put to death. The custom thus established has been handed down to the present day. The parts of the body esteemed the greatest delicacies are the palms of the hands, and after them the eyes. As soon as a piece is cut off it is dipped, still warm and bloody, in *sambal*, a condiment compounded of red pepper and salt. Formerly it was the custom to broil the flesh, as we have the testimony of a European, that a native of Nias, who had stabbed a Batta, was seized by the friends of the murdered man, tied to a stake, cut in pieces with the utmost eagerness while yet alive, and eaten upon the spot partly broiled, but mostly raw. A missionary informed Professor Bickmore that he knew a Batta, who had been guilty of a small theft, being seized, his arms extended full length and fastened to a bamboo, a sharpened prop placed under his chin, so that he could not move his head, and in this condition he was bound fast to a tree. The knife was then handed to the native who had lost the article, who, promptly stepping forward,

cut out of the living man the piece he preferred. The rajah took the second choice, and then the people finished the butchery. Our traveller was shown a spot where a Batta, who had been guilty of adultery, had been killed and eaten by his fellows not long before. Two villagers were seized by this fierce tribe during Professor Bickmore's sojourn on the island, one of them eaten, and the other retained for a future banquet. The resident authority was appealed to, to force the cannibals to deliver up their intended victim, but this could not be done. The Battas occupied a country extremely moun-

tainous, covered with dense forests, and they could only be reached with extreme difficulty, by a large force, and with a great outlay of money.

While in Ceram, the largest island in the Moluccas, Professor Bickmore saw a number of the *Alfura*, a fierce tribe dwelling among the mountains, to whom messengers were sent by the Resident, inviting them to come down to the coast and perform their war-dance:

"In a few hours a party of about twenty appeared. Only eight or ten were able-bodied men; the others were women, children, and old men. In height and general appearance they closely resemble the Malays, and evidently form merely a subdivision of the Malay race. Their peculiar characteristics are the darker color of their skins and of their hair, which, instead of being lank like that of the Malays, is crisp, but not woolly like that of the Papuans. They wear it so very long, that they may properly be said to have large and bushy heads. When in full dress, however, this abundance of hair is confined by a red handkerchief, obtained from the natives on the coast, and ornamented with parts of a small shell, the *Nassa*, in place of beads. Their clothing is a strip of the inner bark of a tree beaten with stones until it becomes white and opaque, and appears much like white, rough paper. This garment is three or four inches wide and about three feet long. It passes round the waist and covers the loins in such a way that one end hangs down in front as far as the knee. On the arm, above the elbow, some wore a large ring, apparently made from the stalk of a sea-fan, *Gorgonia*. To this were fastened bunches of long, narrow green leaves, striped with yellow. Similar ornaments were fastened to the elbows and to the strip of bark at the waist. Each of the warriors was armed with a *parang* or cleaver, which he raised high in the right hand, while on his left arm was a shield three or four feet long but only four or five inches wide, which he held before him as if to ward off an imaginary blow. Their dance was merely a series of short leaps forward and backward, and occasionally whirling quickly round as if to defend themselves from a sudden attack in the rear. Their only musical instrument was a rude tifa, which was accompanied by a monotonous song from the women, children, and old men. At first the time of the music was slow, but by degrees it grew quicker and louder, until all sang as fast and loud as they could. The dancing warriors became more excited, and flourished their cleavers and leaped to and fro with all their might, until, as one of our company remarked, their eyes were like fire. It was easy to understand that in such a state of temporary madness they would no more hesitate to cleave off a head than to cut down a bamboo. They are far-famed 'head-hunters.' It is a custom that has become a law among them that every young man must at least cut off *one human head before he can marry*. Heads, therefore, are in great demand, and perhaps our realization of this fact made these frenzied savages appear the more shocking specimens of humanity. The head of a child will meet the inexorable demands of this bloody law, but the head of a woman is preferred, because it is supposed she can more easily defend herself or escape; for the same reason the head of a man is held in higher estimation, and the head of a white man is a proof of the greatest bravery, and therefore the most glorious trophy.

"On the north coast, near Sawai Bay, the Dutch, a few years ago, had a war with these natives, and when they had driven them to the mountains, they found in their huts between two and three times as many human skulls as it is probable there were people in the whole village, men, women, and children, taken together. When a man is afraid to go out on such a hunt alone, he invites or hires two or three others to assist him, and all lie in wait near a neighboring village until some one chances to pass by, when they spring out and dispatch their victim, and escape. This, of course, creates a deadly enmity between each tribe and every other near it; and the whole interior of the eastern half of the island, where this head-hunting prevails, is one unchanging scene of endless, bloody strife. The same custom prevails over the greater part of the interior of Borneo among many tribes known as *Draks*, the Malay word for 'savage.' There only the heads of men are valued, and new ones must be obtained to celebrate every birth and funeral, as well as marriage. I have seen a necklace of human teeth made in that island by those people. Small holes had been drilled in several scores of them, which were then strung on a wire long enough to pass two or three times round the neck of the hero who wore it. When a head is secured, the brains are taken out, and it is placed over a fire to be smoked and dried. During this process,

the muscles of the face contract and change the features until they assume a most ghastly grimace.

"The dance being finished, we conversed with them as well as we could about their customs, for none of them could speak but a few words in Malay. On the piece of paper-like bark which hangs down in front, each warrior makes a circle when he cuts off a head. Some had one or two of these circles; but one man had four, and I gave him to understand that I knew what they meant by drawing my hand four times across my throat, and then holding up the fingers of one hand, and instantly he hopped about as delighted as a child, thinking that of course I was regarding him as the bravest of the brave, while I looked at him in mute astonishment, and tried to realize what a hardened villain he was. Our North American savages are civilized men compared to these fiends in human form."

While among the Banda Islands, Professor Bickmore ascended the famous volcano forming the island of Gunong Api, or "Burning Mountain," which is the most active crater in the Indian archipelago. The mountain is almost a perfect cone, rising two thousand five hundred feet above the level of the sea. A party was formed for the ascent, consisting of the governor, the captain and lieutenant of a vessel in port, the professor himself, and the requisite number of guides and servants. Crossing at an early hour the "Strait of the Sun" to the foot of the mountain, they prepared for the ascent. A gang of coolies had preceded them, and cleared a way up the steep acclivity; but soon the only road was the narrow banks formed by large masses of rock and sand, loosened from some place high up in the mountain, and which, shooting down to the base, had ploughed up the shrubbery in their descent, and left a sort of pathway.

"As long as we climbed up among the small trees, although it was difficult and tiring, it was not particularly dangerous until we came out on the naked sides of the mountain, for this great elevation is not covered with vegetation more than two-thirds of the distance from its base to its summit. This lack of vegetation is caused by the frequent and wide land-slides, and by the great quantity of sulphur brought up to its top by sublimation, and washed down its sides by the heavy rains. Here we were obliged to crawl up on all fours among small, rough blocks of porous lava, and all spread out until our party formed a horizontal line on the mountain-side, so that when one loosened several rocks, as constantly happened, they might not come down upon some one beneath him. Our ascent now was extremely slow and difficult, but we kept on, though sometimes the top of the mountain seemed as far off as the stars, until we were within about five hundred feet of the summit, when we came to a horizontal band of loose, angular fragments of lava from two to six inches in diameter. The mountain-side at that place rose at least at an angle of thirty-five degrees, but to us, in either looking up or down, it seemed almost perpendicular. The band of stones was about two hundred feet wide, and so loose that, when one was touched, frequently half a dozen would go rattling down the mountain. I had got about half-way across this dangerous place, when the stones on which my feet were placed gave way. This, of course, threw my whole weight on my hands, and at once the rocks which I was holding with the clinched grasp of death, also gave way, and I began to slide downward. The natives on either side of me cried out, but no one dared to catch me for fear that I should carry him down also. Among the loose rocks, a few ferns grew up and spread out their leaves to the sunlight. As I felt myself going down, I chanced to roll to my right side and notice one of them, and, quick as a flash of light, the thought crossed my mind that my only hope was to seize *that fern*. This I did with my right hand, burying my elbow among the loose stones with the same motion, and that, thanks to a kind Providence, was sufficient to stop me; if it had broken, in less than a minute—probably in thirty or forty seconds—I should have been dashed to pieces on the rough rocks beneath. The whole certainly occurred in a less space of time than it takes to read two lines on this page. I found myself safe—drew a long breath of relief—thanked God it was well with me—and, kicking away the loose stones with my heels, turned round and kept on climbing. Beneath this band of loose stones the surface of the mountain was covered with a crust formed chiefly of the sulphur washed down by the rains, which have also formed many small grooves. Here we made better progress, though it seemed the next thing to climbing the side of a

brick house; and I thought I should certainly be eligible to the 'Alpine Club'—if I ever got down alive. At this moment the natives above us gave a loud shout, and I supposed of course that some one had lost his footing and was going down to certain death. 'Look out! Look out! Great rocks are coming!' was the order they gave us; and the next instant several small blocks, and one great flake of lava, two feet in diameter, bounded by us with the speed of lightning. 'Here is another!' It is coming straight for us, and it will take out one of our number to a certainty, I thought. I had stood up in the front of battle when shot and shell were flying, and men were falling; but now to see the danger coming, and to feel that I was perfectly helpless, I must confess, made me shudder, and I crouched down in the groove where I was, hoping it might bound over me: and at that instant, a fragment of lava, a foot square, leaped up from the mountain and passed directly over the head of a coolie a few feet to my right, clearing him by not more than six or eight inches.

"When we had surveyed the top and it was time to descend, we called our guide, to whom some one had given the classical prænomen of Apollo (a more appropriate title at least than Mercury, for he never moved with winged feet); but he could not tell where we ought to go, every thing appeared so very different when we looked downward. I chose a place where the vegetation was nearest the top, and asked him if I could go down there, to which, of course, he answered yes, as most people do when they do not know what to say, and must give some reply.

"I had brought up with me an alpen-stock, or long stick, slightly curved at one end, and with this I reached down and broke places for my heels in the crust that covered the sand and loose stones. For hundreds of feet beneath me the descent seemed perpendicular, but I slowly worked my way downward for more than ninety feet, and had begun to congratulate myself on the good progress I was making. Soon, I thought, I shall be down there, where I can lay hold of that bush and feel that the worst is past, when I was suddenly startled by a shout from my companions, who were at some distance on my right. 'Stop! Don't go a step farther, but climb directly up just as you went down.' I now looked round for the first time, and found, to my astonishment, that I was on a tongue of land between two deep, long holes or fissures, where great land-slides had recently occurred. I had kept my attention so fixed on the bush before me that I had never looked to the right or left—generally a good rule in such trying situations. To go on was to increase my peril, so I turned, climbed up again, and passed round the head of one of these frightful holes. If at any time the crust had been weak, and had broken beneath my heels, no earthly power could have saved me from instant death. As I broke place after place for my feet with the staff, I thought of Professor Tyndal's dangerous ascent and descent of Monte Rosa. At last I joined my companions, who had found the way we had come up, and after some slips and sprains, and considerable bruising, we all reached the bottom safely, and were glad to be off the volcano, and, landing on Banda Neira, feel ourselves on *terra firma* once more."

## THE STORY OF A PIECE OF COAL.

CAN any of my listeners form any idea of what a million of years means? It is very difficult, I grant, but I cannot give any more definite conception of my own great age than by saying I am many millions of years old. You must therefore take it for granted that all this immense lapse of time has occurred since I was born. Before I attained my *majority*—that is to say, before I became really and positively *coal*—I had existed in manifold forms, more numerous and varied than the metamorphoses of the butterfly. You cannot hit upon a greater mistake than to suppose I was originally made just what you now see me—a jetty mass of mineral. The doctrine of metempsychosis, said to be held by the Hindoos, would apply almost literally to my own biography. You may trace my career through a hundred different stages, each more widely various than the other. Nay, the process of elaboration through which I have passed is so complex that I may well be forgiven if I have not a clear recollection of it myself.

I am English born and bred, notwithstanding the tropical character of my antecedents. In some measure, it may be thought that I hardly partake of English characteristics as regards the climate which affected my earlier career; but I can assure you I was never once removed from British ground. In the distant ages to which I have

briefly referred, my recollections go back to waving forests of tree-fern and gigantic club-mosses, as well as to a thick underwood of strange-looking plants. The name now given to this formation by geologists is termed the Carboniferous, and you may form some idea of the ages which have flowed away since then by the fact that no fewer than *nine* subsequent distinct formations and periods occurred. These are known as the Permian, Triassic, Liassic, Oolitic, Cretaceous (or chalk), Eocene, Miocene, Pliocene, and Quaternary, to say nothing of the epoch comprehending the human race. To make myself still more clearly understood, it is necessary to state that the formations *never* than that to which I belong attain a vertical thickness of more than fifty thousand feet! All this mass was slowly formed by gradual deposition along old sea-bottoms, while a more than equivalent period of time was taken up in the upheaving and other processes which have elevated these rocks into their present position!

The climate and geography of Great Britain were very different from what they now are when I was born. You must imagine a soft, balmy temperature, neither too hot nor too cold, and lacking those extremes which at present characterize the seasons. There was no great necessity for extreme heat—rather it was most important to the growth of a luxuriant vegetation to be free from cold. There were few ranges of hills or mountains, for these always cause a refrigeration of the atmosphere by condensing the clouds; thus hanging the sky with a curtain which shuts off a great deal of solar heat. True, right across what is now central England, there stretched a hilly barrier, which separated two coal-formations going on contemporaneously. Scotland and Wales were also then widely different from what these countries are at present. Instead of the grand mountainous scenery they now possess, we had long-extended saline mud-flats, thickly studded with trees now extinct, and known to the geologist by the names of *Sigillaria*, *Lepidodendra*, and *Calamites*. In fact, all the district now considered as "coal-yielding" was then similarly circumstanced. The entire area had a geographical condition similar to the marine swamps which now fringe the coast-line of the Southern States of America. To these the slowly ebbing and flowing tides had access nearly twice a day. Around the more aged trunks of these extinct trees, standing on a muddy, shallow sea-bottom, so to speak—marine worms clustered, and their coiled tubes are now occasionally found fossilized, along with the petrified vegetation to which they clung when in life. These *Spirorbi*, as they are commonly termed, are tolerably plentiful in the north of England. It was owing to the semi-marine, semi-terrestrial character of the area on which the luxuriant vegetation of the Carboniferous period grew, that we now find so many fossil muscles and other marine shells embedded in the same strata.

I am told that chemists nowadays have discovered only one atom or particle of carbon associated with every thousand of the other gases forming the atmosphere. The atmosphere of the period when I was born hardly contained more. This small quantum was absorbed by the waving forests into their structure, and thus added to their solid bulk. Day by day, and year by year, each individual tree grew, so that the mass of solidified carbon increased, but without exhausting the original store. This was constantly being furnished by volcanoes, as well as by the lowly animals of my own time. Every thing, they say, is composed of minute and cellular parts, and originally my atoms freely floated in the air as so many particles of carbon. This was before I had entered into that combination which made me part and parcel of a living tree. Once having been sucked into the leaf-pores of a *Lepidodendron* or *Sigillaria*, I started existence under a new form. I became subject to those unknown laws of vital force which philosophers find so great a difficulty in explaining. I had now an active duty to perform, and had to assist in the growth and well-being of the tree in whose bulk I lay. But this did not prevent me from noticing the many strange objects which surrounded me. Human beings there were none, nor did the race to which I am now so useful an auxiliary appear upon the earth's platform for millions of years afterward. Tree-lizards, not very much larger than those which haunt the sunny banks of old England, climbed up and down the sculptured branches of the forest-trees, and lived upon the marsh flies and beetles, whose "drowsy hum" was the only sound that broke upon the stillness of these primeval woods. They found a shelter in the hollow trunks of *Sigillaria*, in association with the pupæ of beetles and other insects. In some places they have been found fossilized together—a conserved recollection of those bygone times. Great reptiles, much resembling a frog, only as large as a small ox, waddled to and fro over the extensive

beaches, and left their enormous hand-like impressions in myriads upon the yielding mud. As such they are now found in the flaggy sandstones which compose the strata of the coal-formation. Occasionally, when overtaken by death, their carcasses rotted on the shores, and were embedded in the sands, to be found in long-subsequent ages in a fossil state. Several species of these gigantic batrachians existed contemporaneously. Very frequently the salt-water reaches were visited by alligator-like animals, now termed *Archagosaurus*, whose bodies were covered by hard, horny scutes or scales, held together much after the manner a slater now adopts when he tiles a house. These reptiles were five and six feet long, and, together with the great frogs I have mentioned, were the principal and most powerful animals of the age I am speaking of. The atmosphere differed little from its present condition, being neither denser nor more rarefied. This you may prove for yourself by the impressions of rain-drops preserved in the Carboniferous sandstones. The great drops were driven by the wind aslant, so that even now there is indicated the very quarter from which the wind blew at the time! The passing shower over, the sun peeped forth from behind the dark clouds, and his heat baked the mud, and cracked it, just as he does now the bottom of a clayey pond. These sun-cracks were subsequently filled up, sometimes by sand of a different color, so that they are fossilized as truly as the shells and plants. The same sandstones yet bear the trail-markings which the marine worms left after they had crawled over them when in a soft state. Occasionally you may even come across their burrows or holes; while the flagstones also are impressed with ripple-marks left by the retreating tides!

Although the sea-bottom was so shallow in the neighborhood of the great forests, I should state that many miles farther out it gradually shelved deeper, until there was an area where "blue water" was attained. Here the sea was fairly alive with animals of all sorts of natural history orders and classes. Coral banks, with animals putting forth their beautifully colored tentacles, more various than the rainbow hues, stretched over many leagues of old Devonian rocks, and, as the area was slowly submerging at the time, their united labors, in the course of ages, produced no small portion of what is now termed the "Mountain Limestone." Shell-fish, allied to the existing nautilus, found in these purer waters, free from land sediment, the essentials of their well-being. In the limestones which their dead shells helped to form there are no fewer than thirty different species of nautilus! They had relatives termed *Goniatites* (long since died out, for they did not possess the hardness of their congeners), whose chambers were fashioned in a zigzag or angular manner. Then came another group of shell-fish, equally near by blood, the *Gyroceras*, whose coils did not lie so closely together as those of the nautilus. One other class of cephalopods are now known as *Orthoceratites*. They were also chambered, but were straight instead of being coiled. The limestones of this age are crowded with immense numbers both of species and individuals belonging to these genera. Of them all the *Orthoceras* was perhaps the most dreaded, partly on account of its size (some of their shells being three feet long, and as thick as a man's leg), and partly on account of their voracious habits. Fancy them, as I have frequently seen them, with their last chamber surrounded with a fringe of long arms, each of which was furnished with suckers that would indicate no slight danger to bathers nowadays! Hundreds of thousands of these creatures existed. Indeed, they were the scavengers of the Carboniferous seas, eating up every thing that came in their way, and perhaps not particular about preying upon a weakly brother when appetite prompted them. In Scotland, in many parts of the limestones formed at this time, the strata, for hundreds of feet in thickness, are composed of hardly any thing else but the accumulated shells of *Orthoceratites*!

At the bottom of the sea in which these cephalopods lived and flourished there were gathered together immense shoals of a peculiar shell called *Spirifer*, now extinct. Scores of species of this particular shell lived and died there, for it was the period when the family attained its maximum of existence. In fact, they occupied the place in those earlier seas that cockles and muscles do now. Their anatomy was very peculiar, each shell-fish being furnished with a peculiar coiled-up apparatus which it could protrude so as to produce currents that brought to it its food. Small but beautiful crustaceans, of a race then fast dying out, still swarmed the waters. Formerly they were known as *Trilobites*—those of this age are christened *Phillipsia*. Their family had exercised a sort of molluscan oligarchy during previous geological epochs. But the carboniferous period saw the last of

the race, and its limestones became their tomb. I am told that the geologist knows few fossils more beautiful than these little trilobites. The cream-colored matrix in which they are embedded, and the perfect and ornate characters of the fossils themselves, cause them to be greedily collected and much admired. In the same sea were hundreds of species of shells besides, all of which thronged together to enjoy a common life; but to mention them separately would be to convert my story into a tedious detail. I should be lacking greatly in memory, however, if I were not to mention a most abundant and peculiar family, allied to the star-fishes and sea-urchins of the present day—I mean the *Crinoids*. The common feather-star of recent seas most resembles the upper parts of these extinct animals. But the tentacles of the latter were longer, while each was subdivided into branches. When at rest, these closed around the body like the petals of a tulip. Again, each was fastened to a jointed stem, which anchored itself by roots to the sea-bottom. Submarine forests of these crinoids covered many square miles of the rockier portions, and their graceful outlines and motions in the water, as well as their bright colors, were sufficient to induce admiration. In Derbyshire the limestone is almost entirely composed of their broken and aggregated stems.

As these dead shells and other animal remains accumulated along the ocean-floor to form a limestone that should afterward be easily identified by their embedded forms, almost every individual was coated by minute sea-mats. No Honiton lace of the present day ever excelled in grace and elegance that which belonged to these lowly animated beings. In the solid masses of the carboniferous limestone you may now find them festooning shells and corals; and few objects afford greater delight to the geologist when he comes across them. The single corals also—that is to say, those which did not grow in reefs, but lived solitary on the sea-bottom—were not inferior in beauty to any now existing. Their fringe of gorgeously-colored tentacles made them appear like so many animated flowers; and thus the dark caves of ocean then bore many a flower that was born to blush unseen. Slowly, through countless myriads of years, the carboniferous limestone increased to its present thickness, principally by the accumulation of dead shells! The sea-water contained more or less of carbonate of lime, which the shell-fish absorbed in order to build their dwellings, just as the trees did carbon that they might form wood. In this way the minute particles became ultimately condensed into rock masses. Meantime, the water was animated by little creatures that would have evaded human eyesight, although their forms were not a whit less elegant and graceful than those of their larger neighbors. Their tiny shells fell to the sea-bottom, and there formed a limy mud, which acted as a fine cement for the bigger fossils. As time passed on, the sea actually became shallower, by reason of the vast numbers of organisms lying on its floor. The weight of sea-water pressed them into a solid limestone rock, such as you now behold it. Can you wonder, after this, that such a deposit should take a high polish when worked, or that the marble thus produced should be speckled and marked by so many strange forms as you see it in your mantel-pieces or pillars?

In the shallower waters of the sea, and sometimes even in the marine lagoons where the trees grew, multitudes of strangely-clad fishes swarmed. The largest of these, the *Megalichthys*, or "great fish," possessed characters which linked it to the reptile family. Its teeth and jaws rendered it a formidable assailant, and its powerful build and rapidity in swimming made it the terror of its neighbors. In fact, the "great fish" occupied a place among the fishes of its time similar to that held in modern rivers by the pike, its size, also, averaging about the same. Time, however, would fail me to enumerate the various kinds of fish that lived in the same epoch that I did. From four or five feet in length, to thousands no bigger than the common stickleback, all were covered with enamel plates instead of horny scales. Indeed, horny-scaled fishes did not come into existence for ages afterward. In many parts of Lancashire, in the shales which overlie the coal-seams, these shining enamelled plates may be turned up by the thousand. The smaller fishes haunted the shallower lagoons overhung by club-mosses and ferns, and the dim light that broke through these was often reflected from the sheeny mail of *Palaemonisci*, as they wantoned and gambolled, unaware of "great fish" lying near. When the muddy bottoms of these reaches and lagoons became afterward hardened into coal-shale, the dead fishes lying there, whose hard covering had protected them from decay, were entombed and passed into a fossil state.

But what tongue can describe the vegetable wonders of the forests where I grew? The woods were so thick, and the gloom so impenetrable in consequence, that it required a keen eye to make out individual peculiarities. Fancy *Lepidodendra*, four or five feet in diameter, and as much as fifty or sixty feet high, and yet nothing but gigantic "club-mosses!" Their long leafy ribbons waved like the leaves of the aspen, and, where these had fallen off, the bark was most gracefully and geometrically reticulated from their attachment. Thirty or forty different sorts of these immense club-mosses existed at the same time, each characterized by different leaves and bark. The gigantic *Sigillaria* were nearly related to them, the main difference being their longer leaves, straighter stems, and the larger marks made on the bark. The roots, also, of this latter class of trees were very peculiar, and stretched through the mud on every side, seeking a firm foundation for the tree to which they belonged. Shooting many feet above these great club-mosses were huge "mares' tails," as easily distinguished from the rest as the wavy poplar nowadays is from oak and elm. These are called *Calamites*, and, truly, they were extraordinary objects. You have only to magnify the little "mares' tales" growing in ditches until you see them fifty and sixty (or more) feet high, and you would have the best restoration of these calamites that could be imagined. There were many species, characterized by fluted joints and by difference of foliage. Here and there, but more sparsely scattered, were graceful tree-ferns, whose former fronds had left great scars on each side the trunk. The higher grounds were occupied by peculiar species of pine, bearing great berries as big as crab-apples. The humid morass was densely covered by a thick underwood of smaller ferns, which grew there in rank abundance. The equable temperature, rich soil, and humid atmosphere, were just the needful accessories to the growth of vegetation of the class I have mentioned. It consequently flourished at a rate of which we can form but a poor idea from the present. The accumulated trees, ferns, etc., were very great, and these gathered in immense quantities over the entire area. I mentioned before that there was a slow sinking or submergence going on. Well, occasionally, the tides brought up silt, and strewed it over the decomposing vegetation. In fact, many of the forests were actually buried thus, and their trunks are frequently met with standing erect in solid sandstone rock. But though the covering-up of the vegetation prevented the liberated gases from escaping, it also obstructed for a time the growth of other trees. The latter could not well flourish on sand-banks, and so they were limited to conditions elsewhere similar to those I have mentioned. But, as time elapsed, the old circumstances returned. Another forest grew on the site of the older, to be buried up in its turn. During countless ages this alternate growth and covering-up went on, until in some places, as in the South-Wales coal-field, there are no fewer than one hundred different seams of coal!

After this vegetation had been thus collected, chemical changes began to take place. The mass heated and turned black, just as a stack of hay does now when it has been packed in a damp state. By-and-by, it was transmuted into a pulpy condition, wherein almost all traces of vegetable structure became lost. It afterward changed into a solid sub-crystalline mass, and obtained the jetty, semi-cubical character it now presents. As many of the tissues of coniferous trees contain more or less of siliceous matter, which is indestructible, it follows that, when coal is burned, this drops out of the grate as a white ash. When the microscope is applied to it, the peculiar spiral and dotted vessels of these ancient trees are plainly visible. But notice the associations which cling to a piece of coal! It represents a more solid condition of carbon than is to be found in mere wood. And here I should state that, though various conditions of fossil fuel are met with, from green wood to culm and anthracite, their vegetable origin is never once lost sight of; while Chemistry steps in with an easy statement of how these changes occurred! The ancient vegetation of the coal period grew by virtue of the stimulus of the sunlight. The heat and light induced growth, and thus even a piece of coal represents so much fossil sunshine. And now, when men light their fires or manufacture their gas, they are but setting free the light and heat of the sun which poured down on the old carboniferous forest, and were stored up by the vegetation in their tissues. Nay, more, botanists will tell you that the three primary colors of light are sure to be developed at some time or another in the history of every plant or tree—in the blue and yellow which form the green of the leaves, and in the red of the fruit or russet of the bark. Just so with the fossil vegetation termed coal. The very aniline colors which are obtained from coal-tar are nothing

more or less than the restoration of the primary colors which the ancient vegetation stored up from the light. Such is a portion of my history, briefly sketched; but the broad traces of design manifested in my preparation are too palpable to be overlooked. The age in which I was born was a special one, like to none other which went before or came after; and it is to me that modern progress is indebted. In my mass is stored up a force that saves the wear and tear of human muscle and sinew, that does away with the fearful toil which makes simple slaves of men, and enables them to gain daily bread by easier means. But, through the vast ages during which I have been silently stowed away, plutonic disturbances have repeatedly broken through and cracked the solid strata, and have thus brought them to the surface to enable men to work the coal they contain. Meantime, life in its manifold phases has never once been absent; while its upward progression culminated in a being endowed with moral and mental as well as physical perfections, and it was for him and his kind that I was specially prepared, to surround him with the means of social happiness and comfort, and to enable him to rise higher in the scale of intellectual being.

### THE MIRAGE.\*

IF in summer we look at objects visible across a field heated by the sun, they seem to waver, and their shapes continually change. This effect is accounted for by the crossing and recrossing of thin streams of cold and warm air rising and descending. The luminous rays, in passing through them, modify their movements at nearly every instant.

The phenomenon known as the *mirage*, of which the most remarkable examples are met with in Egypt, have an analogous origin. In that country the atmosphere is usually calm and extremely pure. At sunrise remote objects can be seen with the most perfect distinctness. From the borders of the Nile to the limits of the desert arise, from point to point, small eminences crowned with villages and groves of palm-trees, which look down upon each year's inundation of the river. Gradually, as the sun climbs above the horizon, the ground, becoming heated, imparts its superior temperature to the lower strata of the atmosphere. At such times the undulating, tremulous motion of which we have spoken is frequently noticed. But when there is no wind, and the dead calm of the atmosphere allows the lower strata to expand without commingling with those that are resting upon them, the spectator might fancy that he had before him a huge lake, in the midst of which are seen the images reversed of the surrounding eminences, and the villages that are built upon them. The magnificent blue sky seems to be reflected in it too, but, as one approaches, the imaginary sheet of water fades away, leaving only the burning sands in its place, while farther away the same deceptive picture is reproduced under a different aspect.

These appearances often misled the French troops in Egypt. Worn out with forced marches, dying of thirst under the scorching heat of an African sun, and choked by the clouds of sand that filled the air, they would rush headlong toward the fancied shore before them, but the delusive shore, alas! always fled farther and farther at their approach.

To the distinguished *savant*, Monge, who accompanied the French expedition into Egypt, is due the elucidation of this phenomenon. He has demonstrated that the most rarefied strata of air, in this case being the lowermost, a luminous ray darting from an elevated object toward the ground, deflects more and more in consequence of refraction, up to the moment when it is reflected from a last stratum, as it would be from a mirror, and then rises again, subject to a series of refractions the reverse of those first encountered. It thus, at last, strikes the eye of the observer in the same direction as though it came from a point situated below the level of the soil, presenting the reversed images as they would appear if he saw them on the surface of a placid lake.

Mariners frequently get a view of the *mirage* under circumstances the opposite of those that we have just set forth. The temperature of the sea being colder than that of the superincumbent strata of air, renders them less dense below than above, and the reversed picture of distant shores or vessels is defined on the atmosphere itself. Cap-

\* From "Metaphors and Meteoric Phenomena," translated from the French, and in press by D. Appleton & Co.

tain Scoresby made many such observations in the waters of Greenland.

On the 19th of June, 1822, says this accomplished navigator, in one of his narratives, the sun was very warm, and the coast seemed suddenly to come from fifteen to twenty miles nearer. The highlands were raised so much to the view, that we could see them as well from the deck of the ship as we could previously from the foretop. The ice on the horizon assumed the most singular forms; huge blocks looked like pillars and columns; the icebergs and field-ice resembled a chain of prismatic rocks, and at many points the ice appeared to be in the air

at a considerable height above the horizon. The ships that happened to be near us had the most fantastic aspect. On some of them the mainsail seemed to be reduced to a mere nothing, while the foresail looked several times as large as it really is.

Above the vessels, at a distance, we saw an exact picture of them, but reversed and magnified. In some cases this was at quite an elevation above the ship, but then it was always smaller than the original. For some minutes we saw the image of a vessel that was really below the horizon, and one ship was surrounded by a picture of two like it, the one upright and the other reversed.

Among the numerous varieties of this phenomenon of the *mirage*, the one observed by Messrs. Soret and Jurine on the Lake of Geneva, which might be correctly styled the *lateral* or *horizontal* mirage, is not the least curious. These gentlemen were at a window in the second story of a house close to the shore, and were looking with a spy-glass at a number of sail-boats passing from right to left in the middle of the lake, while, nearer to the shore, the same fleet of boats appeared to be sailing in exactly the opposite direction! This was an illusion analogous to the Egyptian mirage, and explicable in the same way. Close to the shore the air had been in the shade a part of the morn-

ing, and was comparatively cooler, while out in the open lake it had been heated by the blaze of the sun. Hence, *vertical* strata of air of different densities had remained motionless, or nearly so, in the prevailing calm, and refraction had produced its magical effects from side to side, instead of above and below, as in the cases previously detailed.

When, instead of occurring in level and regular strata, these effects of refraction and reflection take place in curved and irregular strata, a mirage is produced in which the images are distorted in every respect, broken or repeated over and over again, and separated for considerable distances from each other. This is what takes

A Mirage at Sea.

place in the fantastic aerial vision formerly ascribed to the fairy *Fata Morgana*, and sometimes attracts multitudes to the seashore at Naples, and at Reggio, on the Sicilian coast.

"For an extent of several miles along the coast of Sicily," says an eye-witness of this extraordinary spectacle, "I saw the sea assume the

appearance of a chain of gloomy mountains, while the waters in the direction of Calabria remained perfectly smooth. Above them were seen, in *chiaro-oscuro*, a range of many thousand pillars, all of equal height, distance, and degrees of light and shade. In the twinkling of an eye, these pilasters lost half their height, and seemed to

The Fata Morgana.

bend over, and resolve themselves into arches and arcades like the old Roman aqueducts. Then, a cornice formed along the top, and an endless number of castles, all alike, appeared. These presently faded away into towers that vanished also, leaving nothing visible but a long colonnade, succeeded, in its turn, by windows, and then by pines and cypresses, also indefinitely repeated."

Sometimes these objects are depicted in the sky at a great height above the ground. On such occasions some of them are in rapid motion, while others are at rest. Their outlines often gleam with rainbow colors, and, as the light augments, their form becomes more and

more aerial, until they melt away and disappear when the sun shines forth in all its splendor.

Bernardin de Saint Pierre relates the following incidents :

"A very singular phenomenon was once described to me by our celebrated painter Vernet, who was my friend. During his youth, when in Italy, he devoted himself particularly to the study of the sky, a more interesting branch of his art, no doubt, than the study of the antique, since it is from the sources of light that the colors and aerial perspectives issue that form the charm of pictures, as well as of nature itself. Vernet, in order to fix their variations, had conceived the idea of painting on the leaves of a book all the shadings of each principal color, and then had marked them with different numbers. When he was designing a sky, after having sketched out his rough draft, and the forms of the clouds, he would rapidly note down all the fugitive tints on his canvas, with figures corresponding to those in his book, and then color them at his leisure. One day he was greatly astonished to see in the sky the appearance of a city reversed. He could perfectly distinguish the steeples, the towers, and the houses. He hurriedly made a sketch of the phenomenon, and then, determined to know the cause of it, he set out following the direction of the wind into the mountains. But, what was his surprise when, some twenty miles distant, he found the very city the spectre of which he had beheld in the sky, and had a sketch of it in his portfolio."

It is, perhaps, to the effects of mirage that we must attribute the extraordinary faculty of sight once so famous on the *Ile de France*. Toward the close of the last century a colonist, named Bottineau, could make out vessels below the horizon, which were still a considerable distance. The new science which he pretended to have constructed by combining the effects produced by distant objects, upon the water and upon the atmosphere, he called *Nauscopy*. He went to Paris, provided with letters from the intendant and the governor of the island, attesting the reality of his discovery; but he could not even succeed in obtaining an audience with M. de Castries, who was then Minister of Marine. No one took the pains to investigate the means by which he mastered such surprising results. In the latter, Arago was not altogether an unbeliever, as we glean from his efforts to discover whether certain phenomena of the twilight, in which the shadows of distant mountains probably play a part, would not help to clear up this important secret. The poor colonist returned to his home, on the Isle of France, where he was afterward seen passing most of his time until he died, on the seashore, his gaze fixed on the horizon, and continuing to excite the amazement of all by the accuracy of his predictions.

## HEREDITARY GENIUS.

IT is well known that in the realm of horsehood there is a close relation between breed and speed; does this law of transmitted qualities extend to man and to the mind of man? Are those higher mental traits, which we name talent or genius, inherited like physical peculiarities? A negative answer has been usually given to this question, and everybody can cite instances of gifted parents having mediocre children, which are held as justifying disbelief in the doctrine. It begins, however, to be suspected that the old and prevalent idea is an incorrect one, and must soon be consigned to the category of "popular errors." The recent assiduous study of biological science, the aim of which is to unfold the laws of life, has thrown important light upon the subject of hereditary transmission, and yields accumulating proof that mind forms no exception to the general law.

Mr. Francis Galton, a distinguished English scientist, who has devoted many years to the investigation of the subject, maintains that the principle of the descent of high mental character admits of full proof, and he is about to publish a work in which the question is to be systematically treated, and which will probably go far toward revolutionizing current opinion with reference to it.

In an article in *Macmillan's Magazine*, for March, Mr. Galton fore-shadows his method of investigation. It embraces first an historic inquiry into the hereditary relations of eminent men in England—its illustrious judges, statesmen, commanders, those distinguished in literature and science, poets, painters, musicians, divines, and scholars. This will be an extensive examination of data, and will be independent of all theory. Having established his case in this manner, he will proceed to an analysis of the question with a view to explanations and the determination of principles. In his article he anticipates that portion

of the work which relates to the English judges, and the results are most interesting.

The common notion is that ability is irrespective of descent; that genius starts suddenly into existence and disappears with equal abruptness, and that, therefore, all families have equal chances of turning out eminent men. Mr. Galton denies every one of these propositions, and appeals to the history of 286 of the first judges of England, embracing a period from the restoration of the monarchy in 1660 to 1865. As regards the fact of the eminent ability of these men, we are reminded that they held the foremost places in the vast body of the legal profession. They are taken from three thousand lawyers, who are themselves selected men, and it is from those, by a process of re-selection, that the judges are mainly derived. "The majority of English judges belong to a strongly-marked type. They are not men who are carried away by sentiment, who love seclusion and dreams, but they are prominent members of a very different class, one that Englishmen are especially prone to honor for at least the six lawful days of the week—I mean that they are vigorous, shrewd, practical, helpful men; glorying in the rough-and-tumble of public life, tough in constitution and strong in digestion, valuing what money brings, aiming at position and influence, and desiring to found families. The vigor of a judge is testified to by the fact that the average age of their appointment in the present reign has been fifty-seven. The labor and responsibility of the office seem enormous to lookers-on, yet these elderly men continue working with ease for many more years; their average age at death is seventy-five, and they commonly die in harness. Now, are these remarkable gifts and peculiarities inherited by their sons? Do the judges often have sons who succeed in the same career, and whose success would have been impossible if they had not been gifted with the special qualities of their fathers?"

In answer to these questions Mr. Galton states that of the 286 judges no less than 133, or nearly one-half, had one or more kinsmen of little or no less eminence than themselves. There are no less than ten families where both father and son are English judges, and the same number of other families where either the father or the son is an English judge, and the son or the father is a high legal officer. There are five pairs of judges who are brothers, and seven other judges who had brothers, in high legal offices. In short, out of the 286 judges more than one in every nine of them have been either father, son, or brother to another judge, and the other high legal relationships have been even more numerous. It is furthermore significant that the judges of the very highest ability—the lord-chancellors—illustrate the connection of blood and talent still more impressively, twenty-three out of the thirty lord-chancellors having had kinsmen of exceptionally high ability.

If we now take the question in another aspect, as respects the number of persons of distinction appearing in a family, the case becomes still more striking. According to the common doctrine that ability is fortuitous and wholly unconnected with breed, we are far within bounds in assuming that it is ten to one, against a man of judge-like ability being born in any one family. On this supposition there would be found only one family in one hundred that contained two eminent men, one in one thousand that contained three, and one in a million that contained six. But how does this compare with the families of the judges? Mr. Galton says that the 133 English judges, who have eminent legal relations, may be grouped into ninety-five families, and that of these there are thirty-eight cases of two eminent men in one family; forty cases of three; five cases of four or five, and six cases of six or more. In view of these facts Mr. Galton remarks: "It is therefore evident beyond the possibility of doubt that ability is not distributed hap-hazard, but that it clings to certain families."

We cannot here give the evidence of the larger generalization that ability is gradually built up, so to speak, by degrees in the ancestry, and conversely is dispersed by degrees in the descendants. Mr. Galton remarks that "it rises in a gradual and exceedingly regular curve out of the ordinary level of family life. There is a regular increase of ability in the generations that precede its culmination, and as regular a decrease in those that succeed it. In the first case the marriages have been consentient to its production; in the latter they have been incapable of preserving it. After three successive dilutions of the blood the descendants of judges appear incapable of rising to eminence. These results are not surprising when compared with the far greater length of kinship through which features or diseases may be transmitted. Ability must be based on a triple footing, every leg of which

has to be firmly planted. In order that a man should inherit ability, in the concrete, he must inherit three qualities that are separate and independent of one another. He must inherit capacity and zeal and vigor; for, unless these three, or, at the very least, two of them, are combined, he cannot hope to make a figure in the world. The probability against inheriting a combination of qualities not correlated together is necessarily far greater than it is against inheriting any one of them."

## THE WOMAN OF BUSINESS.

BY THE AUTHOR OF "THE BACHELOR OF THE ALBANY."

### CHAPTER II.—THE LEONE D'ORO.

THE lake and little town of Orta, now as familiar as Hampstead Heath to every cockney tourist, were at the period in question not much better known than the Dolomite Mountains, or the gorges of the Sierra Morena. The situation of the inn, under which our travellers landed, is charming, it stands out so picturesquely into the glassy water, with its roses dropping their leaves, and its vines their clusters upon its breast. The Leone d'Oro, which still exists (flourishing would be too much to say), is fairly entitled to add a small percentage to its bills, on the score of its position, and the delicious views from its windows and galleries, opening on the lake.

When Alexander, leaving his wearied and disconsolate companion sitting, enveloped in a Scotch plaid, as if the sun was in Capricorn, on a bench of white marble which was still warm (for at Orta it had not rained at all), entered the vestibule, the little inn seemed either deserted or asleep. He looked about for a bell, but probably there was no such thing in the town, save those of the adjacent convent, or in the campanile of the parish church. He liked the Leone d'Oro all the more for having no bells. So he passed into a room that seemed to aim at being a *salle-à-manger*, but finding this also as still and empty as a rifled tomb at Thebes or Persepolis, he made his way to a place that affected to be a kitchen, but was also forsaken, and in temperature felt alarmingly like a grotto. This was discouraging, but ere he had time to be provoked, the hostess made her appearance, seemingly by accident, a comely woman of middle age, whose cosy person contrasted favorably with the desolate state of her house, and whose bright and affable eyes were pledges of at least a hearty good-will to do the best she could for her customers. Aided, perhaps, more by his own good looks (for Alexander was a tall, handsome fellow, with clustering brown hair, and had bright eyes in his head) than his acquaintance with the good woman's tongue, he soon came to a perfect understanding with her, and his first care was to provide a comfortable room for Woodville, and see that his sheets were well aired, a point about which he was not a little punctilious.

A common apartment looking out on the water was, of course, indispensable, and on that point there was no difficulty, for he might have had all the rooms in the albergo; the wide world of the Leone d'Oro was all his own. His own little chamber was one of a suite of similar rooms, all of which opened upon the airy gallery already mentioned; it had the merit of being clean, though rudely furnished, and was curtained with a glorious old vine, which twisted itself like a great serpent round the pillars that supported it, pushing its lithe branches through every interstice of the balustrade, from which he could have dropped plump down into the lake.

Woodville was too indisposed—whether it was fancy or not—to want any thing but some posset or another, with a thimbleful of brandy from his own flask in it, which posset, when his friend had ordered, he prudently left the subject of his own dinner, or rather supper, to the landlady's discretion, confiding, however, more in her good dispositions than in her power to give effect to them. But there were always eggs, coffee, and fruit; the lake was sure to furnish some fish, and at that period a flask of tolerable wine was not so hard to find in any part of Italy as it was in later years, after the divine grape caught the distemper, which caused you and me, and all honest fellows, such deep and heartfelt concern.

As soon as the warm drink was ready, Alexander took it himself to Woodville, whom he found sitting on the side of his bed, in a queer old dressing-gown, his hands miserably folded, and so dismal that he might have sat for a picture of blameless insolvency. It was hard to help laughing at the length of his face, long enough at all times, but now longer than ever, he was so chop-fallen, and besides a two days'

growth of a sandy beard added something mildly savage to his physiognomy. No doubt he was inwardly execrating Switzerland and Italy, mountains, lakes, forests, and waterfalls, and all that had tempted him to leave his tranquil garret in Paris to be drenched to the skin on the top of Monterone. Alexander knew all this perfectly well, but he did not know the worst and most indescribable of the poor artist's grievances, which related to his six hours' side on the back of the donkey. He was just recording a vow that no force, persuasion, or argument, should ever induce him again to expose himself to such torture and indignity, particularly as his box was provided neither with spermaceti nor diachylum, when Alexander came in; and hoping to cheer his friend, while he was dropping the cognac into the drink, he repeated what he had gathered from the landlady about the weather, that such a morning as they had on the hills was quite exceptional at that season.

"I suspect the exceptions are tolerably frequent," grunted the dejected artist.

"But you know," said his friend, soothingly, as you talk to a peevish child, "the exception proves the rule."

"From which, I suppose," muttered Woodville, "we are to infer that the more numerous the exceptions the stronger the proof. I know to my cost what exceptional weather means; I never went anywhere in my life at home or abroad for the sake of a holiday, or change of air, or climate, without finding it exactly the contrary of what I had been promised—but it was always exceptional—that was always the word."

Alexander knew this pettish fit would pass with a good night's rest, but not before it, so he made as if his dinner was cooling, and left his companion to get into bed. But there was still a moment to spare before his dinner came, and from the balcony through the foliage of the old vine he enjoyed a view which repaid him for what he had been cheated of in the morning. If he missed the sunrise, there was a sunset to make him amends. The lake glowed with all the lovely combinations of color which you see on the necks of doves, or breasts of golden pheasants, the sky lending its glories liberally to the unruffled water. The terraces and white walls of San Giulio were bathed in rose, rapidly deepening to vermilion; the mountains seemed pressing in all round as it were to take charge for the night of the sleeping beauty of the lake, and the hamlet on the opposite side seemed already buried in slumber under the shadows of the great chestnuts for which Orta is famed. The languor of the hour and the clime was over every thing, but it was the languor of life, and the scenery pleased Alexander more than the severer beauty north of the Alps, which might have been expected to be more in tune with the boldness and vigor of his character. But the handsome young lawyer was as genial and social as he was strong, and the Alps rose in his esteem when he saw their savage grandeur softened, as it was here, by all the varied opulence of Italian vegetation. The convent bells, too, which were now filling the air with tinkling music from the adjacent heights dedicated to St. Francis (suggesting refection, while perhaps they only meant to invite him to prayer), disposed him to be even more than social, even to be convivial, just at the moment when he was called to supper, and, through the defection of his friend, was forced to sit down to it alone.

There are men who will tell you solitude spoils their appetite; but Alexander was not a man of that kind, and though he preferred company, the want of it did not prevent him from doing justice to the omelet, the frittura, and roast fowl, which were set before him, and which, with cheese, coffee, and a bottle of the best wine to be had, proved the resources of the Leone d'Oro not so deficient as first appearances threatened. In short, he thought all so good that his wonder grew how such cheer was to be had in an inn which could only boast of two guests in the height of the summer. "Can it really be true," he asked himself, "that no travellers before ourselves have ever had the good sense to turn aside from the beaten route to visit this attractive spot?"

'Are we the first  
That ever burst  
Into this silent lake?'

It was not very likely, in such circumstances, that they kept a travellers' book, but the rarity of a guest would perhaps make them the more careful to record the arrival of one, when such a secular event occurred.

At all events he would ask the question. The Leone d'Oro did keep a book. If it had few visitors it made the most of them. The

book was brought him, but he turned over the entries of seven years, scarcely finding the names of as many Englishmen. For the last three years, however, the names of a Mr. and Miss Evelyn appeared uniformly in August, and, with a curious precision, always on the same day of the month. They had, moreover, as the entries showed, always come from a place called La Tour, which Alexander learned from his itinerary was a town in the Vaudois country, so renowned in history for the struggles and sufferings of its people in the cause of religious liberty.

"Three times!" thought Alexander. "The Evelyns, whoever they are, if they are not the original discoverers of Orta, know at least how to appreciate it. I honor their constancy, but I fear it is exhausted; already they are a day behind their time, so they will probably return no more."

With these reflections he drank the last glass of his bottle, strolled to the top of the Monte Sacro by what remained of twilight, and went to his bed.

### CHAPTER III.

#### THE GIRL OF BUSINESS.

At Orta they do not eat their nightingales and thrushes so systematically as is the general barbarous usage in Italy—at least, they had not eaten them all up at the period of our story; for there remained a choir quite large enough, at least, with the help of the convent-bells, to have roused Mr. Alexander at a very early hour, had he not required a little more of Nature's soft nursing than usual to set him up after the fatigues of the last two days. In fact, he slept until near seven, and even then lay on his back for a few minutes, which was also against his usage, just to deliberate what might be done before breakfast, as well as during the day.

While his thoughts were thus occupied, he fancied he heard a stirring and rustling in a room adjoining his own, and which he now perceived was only separated from it by a slight, and perhaps temporary partition. He knew it was not Woodville's, for that was on the other side of the corridor. Presently a voice, or voices, were also audible; it was easy to distinguish that they were female voices. One was remarkably articulate and silvery, and evidently that of an English girl.

"Ha," said Alexander to himself, "this is Miss Evelyn, no doubt; they must have arrived during the night, or at a very early hour this morning. They are tolerably punctual, I must do them the justice to say."

He now heard the casement opened, which gave access, like his own, to the vine-wreathed balcony, and, at the same instant, the lady, with the more youthful and articulate voice, broke forth into a rapturous address to the lake, of which, without hearing every word, he was easily able to gather the tenor. She vowed it was lovelier than she had ever seen it before; she said the foliage was richer, the roses sweeter, the grapes larger—every thing was more beautiful than ever. Over and over again she vowed it was the sweetest spot in all the world, and once or twice she even called the lake her own, which made Alexander think that she must indeed have been the original discoverer.

After this burst of girlish enthusiasm, her tone was a little altered, but still her next-room neighbor could collect very distinctly that she was delighted on her father's account, even more than her own to find herself once more at "the dear quiet, old Leone d'Oro."

The next observation was addressed to her companion who was probably her maid.

"I trust, Hannah, we are the only people in the house?"

Alexander took the reply, but must have been the affirmative, for the mistress was

heard to say that more visitors would destroy the charm of Orta and quite ruin the Leone d'Oro.

It was a pleasant idea of Miss Evelyn's, that of an inn ruined by its guests!

She seemed next to be inquiring about some books, hoping nothing had been left behind; and she called for a certain list in a different key from her rapturous speech at the window—not at all harsh or English, only a little dry and peremptory. The list must have been handed to her, for Alexander could hear her murmuring over a number of names in succession, obviously telling off the volumes they referred to, which appeared to be all forthcoming, except a certain count-book, about which there was a to-do. The title of the miss

book sounded funny to Alexander's ear. It was called "the little green Bobbio account-book," and it would evidently be a serious affair for Hannah if the book with this droll name had by any chance been lost or even left behind.

All this occupied so short a time, and the young lawyer's curiosity was so much excited, that it only now occurred to him that he was rather in a false position, placed so as to overhear the conversation of a lady who not only was not aware that his room was occupied, but was under the impression that she and her father were the only guests in the house. To make any sign now, by coughing, or in any other way, would be almost to confess himself an eavesdropper; so that he was quite at a loss what to do, and it was a great relief to him when, in a few minutes, both mistress and maid left the room, probably to go in quest of the missing treasure.

You may suppose he had plenty of food for his thoughts, and employment for his faculties of divination, while he made his expeditious but not negligent toilet, a little more careful certainly than it would have been if the Evelyns had not arrived. Alexander was not yet much of a lady's man, or a deep student of the sex; but he had never been so perplexed as he now found himself between the conflicting indications of character out of which his fancy had to frame a notion of Miss Evelyn, with only her voice and a few scraps of dialogue to guide him. She was a very young lady by her enthusiasm, and not so very young by her careful habits. She was wild about scenery, and a martinet with her maid; had a passion for roses, yet kept accounts; and, lastly, she arrived after he had gone to bed, and yet she was stirring before him. Was there ever such a curious medley? Was there ever such a riddle of a girl?

However, it was not to solve enigmas, much less to keep accounts, that he had come to Orta; so, as soon as he was dressed, he sallied forth, mortified a little at finding that he had already lost so much of the morning. In the kitchen, through which he passed, having missed his direct way to the inn-door, he found my lady's maid (a tight girl of thirty, neatly dressed in a crisp-blue calico, black apron, and smart cap fluttering with pink ribbons) in an altercation with the hostess on the subject of breakfast, the difficulty arising, as usual in such cases, from the mutual ignorance of the parties of each other's tongue. Hannah wanted new-laid eggs, and, as the landlady neither understood English nor French, at least the French that Hannah spoke, the girl was reduced to the primitive expedient described in the old rhyme—

"If I wanted bread  
My jaws I set a-going,  
And asked for new-laid eggs  
By clapping hands and crowing."

Through Alexander's intervention the difficulty was soon got over, and the maid was profuse of her thanks and courtesies for the assistance which her obliging countryman gave her to settle it. Alexander then gave his own instructions for breakfast, at which meal he expected to be joined by his friend, and in the mean time there was half an hour at his disposal, time enough for a row to the island and back again. On the little quay, which was hard by, he found an elderly gentleman, who, of course, was Mr. Evelyn, inquiring about a boat for the same purpose, but for a later hour, after the heat of the day had subsided. They saluted one another without speaking. Alexander selected his boat, and the elderly gentleman returned to the inn.

## ABOUT EARS.

I HAVE been asked, says Toussenel, why the horse, which delights in cleanliness, muddies the water before drinking; and why his ears, erect in servitude, turn downward in the state of liberty, contrary to what occurs in the dog.

The answer to these questions is easy; and, in the first place, the horse does not mean to muddy the water which he agitates.

The horse is a native of sandy, sun-burned regions, and he rejoices in the toilet—two reasons for loving the bath. But, as in these countries the rare and treacherous wave is the habitual resort of crocodiles, of leeches and electric eels, the horse paws the water before entering it, so as to drive away such vermin; and he sounds the bottom with his hoof to see whether it be propitious for his bath, for every horse that feels the water is ready to roll in it.

As to the second question, the answer requires a physiological study of the ear.

The ear is an organ destined to give information by the perception

of sounds in space; consequently the direction of the ear of a beast should instruct you at once concerning its behavior and its character. The ear of the hare, directed backward, tells you that this poor animal is destined to be chased. This direction of its channel of sound announces the especial object of the organ, viz., to inform the fugitive of the number and the swiftness of his pursuers.

But, if the ear of the beast chased is turned backward, so cannot be the ear of the pursuer, of the fox, or the wolf, or the hunting-dog.

The ear of these *forcers* assumes, in fact, an opposite direction. The primitive hunting-dogs—the greyhound and the shepherd's dog, which only hunt by running down their game—will then have their ears straight, and the auditory canal directed forward. The weasel, the cat, even the fox, which need to know what is going on among the branches overhead, will have their ears large, expanded, and fitted to perceive little noises above them.

The horse, in his wild state, wanders in pasturing, but does not hunt; he has no man in charge, and grazes with his head low. The conduit of the ear is then directed toward the soil, which is the best of all conductors of sound, and which transmits to it that of the march and the voices of the enemy.

But, when the horse has once accepted the companionship of man's labors and dangers, other duties are incumbent on him in this capacity, and he changes his bearing along with his diet. As soon as, with this change of spirit, he must take the lead, and guide his rider in the dark, he raises his ear like the greyhound, so as to catch every sound in front of him. By virtue of the same principle, the setter dog, when made to quit running down his game, ceases to hold his ear straight, and wears it like the mummy.

Why, then, all dogs of running breeds ought to carry their ears straight, like the greyhound and the Arabian horse? Certainly; and you are up to your ears in the truth.

Pallas, cited by Cuvier ("Règne Animal"), has also noted the downward cast of the ear in a wild colt caught upon the steppes of Tartary, and which became extremely docile.

The horse has two muscles of the ear peculiar to himself among animals, and which give it a varied freedom of movements.

The ears of the mole close by a sphincter muscle which excludes the dirt. In the owl and the bat tribes, this organ has remarkable developments—in some of the latter (to which it gives name) being as large as the rest of their body, and completing that grotesque appearance which has made them a favorite type of the hobgoblin.

## SKETCHES OF EARLY LIFE IN BOSTON.

### No. II.

HOW THEY TRIED TO REGULATE LIFE AND MANNERS IN BOSTON.

IN its social aspects, life in Boston during the earlier years of its settlement was altogether unique. When the nine-o'clock bell rang at night, it was the signal for all wanderers in the streets to betake themselves to their respective habitations; and "presently the constables walked the rounds to see good order kept, and to take up loose people." The curfew still tolls, not only in Boston, but in almost all the towns and villages of New England; at this signal, however, the lights are not extinguished, neither are the embers on the hearth-stone covered with ashes—embers and hearth-stones for the most part belong to the past; patriots must now swear, if they swear at all, "by their furnaces and registers"—nor does silence reign in the streets. In modern times, the season of festivity begins at the hour when our good fathers and mothers consigned themselves to saintly slumbers.

On every Saturday morning, all persons residing in Boston, able to bear arms, were drilled on the Common, and, after the companies were formed in order, we read that "a certain space of time was allotted to private devotion, after which the officer in command prayed aloud for a season." At the close of the drill, another season of devotion followed. "The poor Indian" could testify that these men were not backward in the day of battle, because they prayed before they fought.

In these days, when contractors under government are supposed to enrich themselves in so many illegitimate ways, and the rate of taxation in some of our cities is so much enhanced

by the fraudulent transactions of officials, it is refreshing to find how differently such things were managed by the settlers of Boston. The first public contract which they made was for the erection of a framework of timber, then called the "Bilboes," on which offenders were exhibited with some badge of shame—usually a piece of scarlet cloth, with a letter upon it, indicating the nature of their crime—suspended around their neck, or perhaps publicly scourged; and this structure was usually placed directly in front of the meeting-house door. The bilboes having been constructed, duly examined by the authorities, and the bills audited, the first person that was sentenced to occupy the machine was the carpenter who built it, "in consideration of his excessive charges for the work."

In the good old times of which we write, it is evident that the evils of intemperance were as great as they have ever been in any portion of our history. Mr. Winthrop complains bitterly of the amount of hot drinks consumed by the young people on board the *Arbella* during the voyage from Southampton to America; and every art of legislation was devised to check the ravages of this vice, short of absolute prohibition, or any restriction upon the *private* use, by the more respectable members of society, of what is sometimes termed in the statute "the good creature of God." Mr. John Josselyn, gent., who visited Boston eight years after its settlement, says: "I found two houses of entertainment, called ordinaries, into which if a stranger went, he was presently followed by one appointed to that office, who would thrust himself into his company *uninvited*, and, if he called for more drink than the officer, in his judgment, thought he could soberly bear away, he would presently countermand it, and appoint the proportion beyond which he could not get one drop."

The custom of "drinking one to another, which draweth the abominable practice of drinking healths," is positively forbidden by law. Among the reasons assigned by the General Court for this order, are the following:

"1. It was a thing of no good use.

"2. It was an inducement to drunkenness, and occasion of quarrelling and bloodshed.

"3. *It occasioned much waste of wine and beer.*

"4. It was very troublesome to many, especially the master and mistress of the feast, who were forced thereby to drink more oft than they would."

Drinking with disreputable associates, more especially if it was not accompanied by judicious and timely remarks on the evils of intemperance, also appears to have brought the offender under the reproof of the magistrate. Thus "Benj. Hubbard is solemnly admonished of his failing for being in company with James Brown and the rest, and often drinking of the strong-water bottle with them, *and not reproving them.*"

A man, convicted of drunkenness in the year 1638, was sentenced to attend every day upon the session of the General Court, and in their presence wear the ominous scarlet cloth, with the letter D inscribed upon it. The thought will here suggest itself, whether some such exhibition as this might not have a salutary effect upon our modern representative assemblies, and also whether the general aspect of these bodies would not be somewhat enlivened if the erring *members* thereof were adorned in like manner with scarlet.

Some time before the transfer of the patent to America, a petition was forwarded to the Massachusetts Bay Company to this effect: "We especially desire you to take care that no tobacco be planted under your government, unless it be some small quantity for mere necessity and for physic, for preservation of their healths; and that the same be taken privately by *ancient men*, and none other." It would appear as though "the ancient men" were a little inclined to monopolize the poisonous weed.

A few years later, we find that the court felt it to be necessary to relax in some degree the rigidity of the law; for it is ordered "that no person shall take any tobacco *publicly*; and

every one shall pay one penny for every time he is convicted for taking tobacco in any place." Still later, the law is again modified: "It is further ordered, that no person shall take tobacco privately, in his own house, or in the house of another, *before strangers*; and that two or more shall not take it together, anywhere, under the penalty of eleven shillings and sixpence for every offence."

From the tone of legislation adopted soon after this, we may infer that the early settlers of Boston found it as hard to regulate such matters as these by law as their posterity have proved it to be. "This court, finding that, since the passage of the former laws against tobacco, *the same is more abused than before*, it is therefore ordered that no man shall take any tobacco in the fields, except in his journey or at meal-times, upon pain of twelpence for every offence; nor shall take any tobacco in any inn or common victualling-house, except in a private room there, so as neither the master of the same house, nor any other guests there, shall take offence thereat." Constables are further charged "to take special notice of common coasters, unprofitable fowlers, and tobacco-takers."

In modern times, the only legislation that we ever heard of in this country, aiming to regulate the matter of apparel, was the law adopted some few years since by Congress, forbidding our ministers abroad to assume any other than an ordinary citizen's dress on state occasions, it being presumed that the crow-like appearance of an American ambassador, moving about in sable simplicity among the gilded and scarleted myrmidons of foreign courts, would be an impressive testimony to the chaste and severe grandeur of republican institutions. Any attempt on the part of our Legislatures to interfere with the ordinary fashions of society would be the ruin of the political party which proposed it.

It was not so in the days of which we write. Four years after the settlement of Boston, this whole matter, in its most minute details, came under the inspection of the General Court, when the number of slashes in the sleeve was determined by law; and lace, gold thread, gold or silver girdles, hat-bands, belts, ruffs, and beaver hats, are forbidden any longer to be worn, with the proviso that those who already have such vanities as these in their possession may wear them until they are worn out, always excepting "immoderate great sleeves, slash-apparel, and long wigs," which must see the light no more. With a minuteness that is edifying, the statute goes on to say that "no person shall make or sell any *bone* lace, to be worn upon any garment or linen, upon pain of five shillings for every offence, provided that binding or small edging lace may be used."

The grand climacteric of this style of legislation appears in an order providing for the arraignment before the court of any person "who should give offence to his neighbor by the excessive length of his hair!"

There is a *specialty* in the legislation of this period, which is without any parallel in the history of nations. In 1637, "Geo. Barlow for his idleness is sentenced to be whipt," and "Richard Osborne is enjoined to give an account to the constable weekly *how he doth improve his time.*" "Capt. Lovell is admonished to take heed of light carriage." A year or two after, "Elizabeth Chaulkley is enjoined to make double restitution for the eggs and things which she stole;" "John Grosse, for common railing, is disfranchised;" and "John Stone and his wife are admonished to make bigger bread."

The legislative assembly of the colony were perhaps as profitably occupied in the consideration of such matters as they would have been if they had turned their attention to other topics, which in our day consume the time of senators and representatives; but it is hard to believe that a civilized community could ever submit to such an impertinent interference with their domestic affairs as is involved in the following order of the court: "A daily register shall be kept in each family of what is done by all and every person"—subject, of course, to

the inspection of the legal authorities. We wish that a few of these family registers had been preserved and transmitted to posterity. What strange light they would throw upon the habits of the times!

*Freedom of utterance*, both in private and in public, is one of the priceless privileges of a citizen, and there are none who hold it more sacred and precious than the good people now inheriting the soil and the virtues of the early settlers of Boston. It might not be going too far to say that, among the great reformers and "silver-tongued orators" to whom that city has given birth, there are some whose candid and trenchant criticism of public men and measures at times borders upon vituperation. Let us see how these outspoken brethren would have been treated, if they had lived and talked some two hundred and thirty years ago:

"Boston, 1632.—Third Annual Session of the General Court.

"Ordered, that Thos. Knower be set in the bilboes for threatening the court, that, if he should be punished, he would have it tried in England whether he was lawfully punished or not.

"Ordered, that Sam. Norman shall be whipped for saying that, if the ministers who come here will only rail against England, it would make them more popular with many persons.

"Ordered, that Ensign Jennison shall be fined the sum of twenty pounds for upbraiding the court with injustice, he having uttered these words—"I pray God deliver me from this court!"—professing he had waited from court to court, and could not have justice done him."

Mr. Aspinwall was discharged from being any longer a member of the court, for affirming his conviction of the lawfulness of a certain petition that had been sent in; and Mr. Coggeshall was, in like sort, dismissed for declaring his belief in the innocence of the Rev. John Wheelwright, who had been charged with teaching erroneous doctrine.

Robert Shorthose was committed to prison for remarking to a bystander that, "if the magistrate had any thing to say to him, he might come to him." Mr. Shorthose was, however, soon released, having become bound, in the sum of twenty shillings, to appear in person at the next session of the court, and to be of good behavior in the mean time.

Thos. Lechford, who appears to have fallen into the habit of expressing his opinion of matters and things in general rather freely, "acknowledging to the court that he had *overshot himself*, and is sorry for it, promising hereafter to attend to his proper calling, and not to meddle with controversies, was dismissed."

Mr. Thos. Makepeace—it is sad to think that a man with such a name should have exposed himself to official censure—was arraigned before the court, and, "because of his *novel disposition*, was informed that we were weary of him, unless he reform." What would happen if all persons in our day possessed of "a novel disposition" were liable to similar treatment?

Two or three years after this, Mr. Israel Stoughton published a book in which he had the temerity to intimate that the Court of Assistants were not to be considered as, in all respects, paragons of legislation. The civil authorities at once took up the matter, and the book is declared "to have given much trouble and offence." The pressure upon the author soon becomes so severe, that regard for his own safety impels him to acknowledge his sin, and at the same time petition the court that they would cause "said book to be burnt, as *weak* and offensive." To what depths of humiliation must Mr. Stoughton have been reduced before he could be led to pronounce a work, written by his own hand and bearing his name, to be a *weak* production! But even this acknowledgment did not save him from punishment.

It was not, however, only those who railed against the state, upon whom the arm of the law fell; the clerical profession were also shielded from improper criticism, and protected in the ex-

ercise of their functions as teachers of religion against lay intrusion, especially against the interference of women with their prerogatives. Perhaps the Boston clergy would not be as sensitive to the charge of heresy as they were when a stiff-necked Antinomian was fined forty shillings "for affirming that all the ministers in Boston, except two and perhaps three, *did teach a covenant of works*." The "covenant of works" is thought somewhat better of, now, than it was in those days.

Two pictures are brought before us in the next extracts that we shall give from the records of the General Court, which may excite laughter or tears of indignation, according to our mood:

"Ordered, that Jane Hawkins has liberty till the beginning of the third month, called May. And then the magistrates, if she does not depart before, to dispose of her. And, in the mean time, she is not to meddle in surgery or physic, drinks, plaisters, or oils; nor to *question matters of religion*, except with the ministers, for her own satisfaction." The doctors of medicine, as well as the doctors of divinity, are protected by this order.

The second picture suggests more painful thoughts. In accordance with a general law, to be found in the statute-book, a woman—whose name we shall suppress, lest there may be surviving relatives whose feelings might be wounded—was condemned to stand for half an hour in front of the meeting-house on a lecture-day, "with her tongue hanging from her mouth in a cleft stick, *for speaking against the minister*." Suppose that, in these days—but we forbear.

Neither did the law fail to recognize the sacredness of *private* reputation, and to visit the slanderer of his neighbor with swift and stern punishment; as, for instance, it is "Ordered, that John Lee shall be whipt and fined for calling Mr. Ludlow false-hearted knave, hard-hearted knave, and *heavy friend*." We may think that our laws ought to protect us more effectually than they do against the aspersions of the ill-minded; but it would be hard if one were liable to be whipped and fined for insinuating that some of his friends were a little *heavy*.

The restrictions upon travel present a very singular feature in the legislation of Boston. The jealousy which existed between the Massachusetts and the Rhode Island colonies is easily accounted for; but it could hardly have been expected to show itself in the form manifested by an enactment where the people of the neighboring district are spoken of as if they were dangerous animals going about to devour. This is the statute: "All persons from the Providence Plantation are forbidden to *go at large* in the Massachusetts colony;" and a young man from Providence, who ventured to visit Boston for the transaction of business, was actually arrested and imprisoned.

Somewhat more inexplicable is the following act: "Mr. Richard Brown is fined five pounds for going to Connecticut without leave."

It is not to be understood that, mingled with all this quaint and often absurd legislation, there is not also much which indicates great wisdom and forethought. They were wise men who passed these foolish laws; wise men still continue to pass foolish laws. Who can tell how some of our doings will read two or three hundred years hence? While we are casting stones backward, we may be hit in front.

We shall next proceed to show how they conducted public worship in Boston.

## BIRTH, INFANCY, MARRIAGE, AND DEATH IN BULGARIA.

FROM the cradle to the grave, the Bulgarian is haunted by strange customs and observances, such as are little known in Europe. When a child is born, the witch, who is present officially, brings a reaping-hook into the room, and then proceeds to rub the infant all over with salt, and to fumigate the room in order to drive away all intrusive evil spirits from the mother and child.

With the exception of this bath of salt, a Bulgarian child is never washed until he attains the age of seven years; and, for the first years of his life, a piece of garlic (in the case of a girl, one or two coins) is tied upon his head to preserve him from the evil eye. As soon as he is able to work, he is surrounded by superstitions which he is obliged to observe: if he fetches water, he must throw away some of it; if he brings flour from the mill, he must burn incense under it; in short, he cannot take a step without coming in contact with a superstition or an *adet* (custom), which, if not respected, will avenge itself on him, and, without counting the spirits who lie in wait for him in the forest or at the fountain, his life is filled with fears which go far to compensate for its great enjoyments of eating, drinking, and dancing.

When a young man wishes to marry, he speaks to his parents, who arrange the matter with those of the lady chosen, and *swaty*\* are sent to propose in due form; the amount of the corbeille is settled, as well as that of the *bash parasi*, or head-money, presented by the suitor to the mother of his intended, and then the *gody*, or betrothal, takes place. This is a ceremony of great interest to all Bulgarians, who have the same tastes as those commemorated in the songs about their great heroes, of which the constant chorus is—

"Pak jede i pije,"  
"And he eats and drinks."

The *gody* is usually held at the house of the girl's parents, where the elder guests sit around a cloth spread on the floor and covered with various dishes all strongly flavored with garlic, while the wine-jug circulates freely; in another room the young people indulge in a similar repast, and afterward dance outside the house, the girls singing songs at intervals. The young man then brings in his presents, which consist of various articles of feminine clothing, several pairs of slippers, bracelets, ear-rings, a head-dress and necklace of gold or silver coins, and a silver girdle; the value of these offerings is discussed by the father of the girl, and a fresh bargain ensues, the suitor adding coin by coin to the necklace till his future father-in-law is satisfied, and, when this result is attained, all the finery is placed in a *tekneh*, a wooden dish used for making bread and for a cradle. Then all the guests set to work again at the banquet till daylight dawns upon the many tipsy and the very few sober. The next day the young lady puts on all the presents of her *fiancé*, and is considered as engaged.

This betrothal is in no ways a religious ceremony, and leaves it open to either party to break off the engagement, but such a rupture seldom occurs; the marriage never takes place within six months of the *gody*, and is often delayed for two or even three years.

With some rare exceptions, these arrangements are by no means love-matches; the young man wishes to establish himself as head of a household, and chooses a wife as he would a yoke of buffaloes, looking upon her as a machine for labor and the probable mother of sons who will in time be able to work for him, and whom he can beat as his father beat him until he became too strong to permit it—for a Bulgarian son, when he grows up, makes no scruple of returning with interest the blows received from his father. Thus the bride is chosen, not for the beauty of her more or less Kalmuck features, but for the muscular strength which will render her valuable as a beast of burden.

Sometimes you may meet with a Bulgarian Lindoro who translates his passion into the music of the Gaida, or courts some stalwart Rosina by playfully throwing lumps of mud at her as they meet at the fountain, or who buys an enormous pair of boots and spurs to attract the attention of his beloved, and proves the strength of his affection by treading upon her toes.

But Lindoro here, like the true Lindoro everywhere, is poor, and perhaps seeks, by a disinterested love, to attract into his own purse a few of the zecchini which he needs; at any rate, it is no blasphemy to doubt the purity of his motives in a country where a powerfully-built wife is a good investment, instead of being an expensive luxury.

The marriage (*swadba*) is prepared for by the bridegroom's installation in his new house, and the purchase of various domestic animals, especially a pair of oxen or buffaloes, without the possession of which the match would be considered a very poor one for the lady, if not entirely out of the question; when all is ready, he sends his parents or

his swaty to announce that he wishes the ceremony to take place in two or three weeks.

During the week preceding the marriage, which is always celebrated on a Sunday, the parents of the bride and bridegroom prepare the furniture, etc., of the new *ménage*, the girls of the village dance before the house of the bride, and the youths pay the same compliment to the bridegroom. On the Friday before the marriage, the presents, hung on a cord, are exhibited in the bride's house, and she herself has her hair plaited into innumerable minute tresses; then she takes, for the first and last time in her life, a complete bath. Horrible as this statement seems, it is the literal truth. Till the age of seven years a child must not be touched by water, and, although, after that period, the face, hands, and feet may be washed, the cleansing of the whole body would be *chok gunah*, a great sin, and is never practised by either male or female Bulgarians, with the solitary exception mentioned.

On the eventful Sunday, when the *papas* are ready, the ceremony takes place in the church, if there be one, or otherwise in the bridegroom's house, and, after the marriage, the happy couple are led in procession to the mansion of the bride's father, where the young girls dance, corn is sprinkled over the husband and wife, and the latter, her face covered with a veil (often scarlet), kisses the hands of all the married women of the village, receiving in return a fig from each of them.

Then all the usual feasting goes on, and all the guests drink more than is good for them, and the married couple are shut up in their own house for a week, during which time they may neither go out nor receive visits.

When this period of imprisonment is over, the married women fetch the bride, who carries two water-buckets, to the fountain, round which she walks three times, preceded by the oldest of the women, then the contents of the buckets are thrown over her, she kisses hands all round, and again receives a present of figs.

The same day she pays a visit to her mother, and is henceforward considered as a member of the sisterhood of married women.

The married women are not generally allowed to join in the village dance, although some of the bolder spirits amongst them occasionally do so; this dance, which is called in Russian *bitchok*, is here styled *horo* (Χόρος), and strongly resembles the "Romaika's dull round." A circle of dancers is formed, the girls and men holding each other by the belt or girdle, and going round and round for hours to the music of the *gaida*. The motion is slow, monotonous, and ungraceful, but the coup d'œil from a distance is picturesque enough, from the gaudy colors of the female dresses. In our village the feminine taste for ornament has invented a new head-dress, consisting of pieces of the English or French newspapers received by us, which are in great request by the village beauties as *bonjouis*, or jewels; the portions most sought after are the headings or the advertisements in big capitals, so that the Derekuoi young ladies may often be seen wearing on their foreheads such placards as the following: "The Times," "Mort aux Rats," "Pall Mall Gazette," "Vente à cause de Faillite," "Holloway's Pills," "Plus d'huile de foie de Morue," "A vendre à grand rabais," "Mme. Elise, Marchand de Modes," and a host of other typographical varieties, which are highly prized in the first circles of the Derekuoi fashionables.

At the end of every life, whether one of hardship and labor like the Turks, or feasting and idling like the Bulgarians, comes death; but just as the latter considers baptism not as the admission of the infant into the Church of Christ, but as a mere sprinkling with water for which the *papas* receives so much, so he looks upon death as the discharge of a mere animal function.

When he is given over by the witch, he prepares for the passage from life to an unknown world with a *sang froid* strongly resembling courage, but which is merely the result of a fatalism arising from apathy; he bargains with the *papas* as to the price of his burial, orders the mortuary feasts, and, in short, prepares himself very quietly to repose in the grave which is already dug for him. During all this time the room is filled with women, shrieking and groaning in a manner sufficient almost to kill a healthy man.

At the moment of death, all pots, kettles, and other utensils are turned upside-down, in order to prevent the soul of the departed taking refuge in one of them, and therefrom commencing a system of annoyance against the family; candles or tapers are lit around the body, and the head is dressed with flowers; a great *ikon* (picture of a saint) is placed upon the breast, the body is clothed in its best clothes,

\* For this word there is no exact equivalent in English; the *swaty* are friends of the young man who act as his proxies in the delicate matter of "proposing"—to the parents of the lady, however, never to herself; the latter ceremony, which is so much thought of in England, not being customary in Bulgaria.

or in some specially made for the purpose, and a pair of slippers, while all the members of the family run outside and scream a lamentation, which is generally after this fashion:

"Oh! Tanaz! Boze! Bozé!

Who will cut wood for us now?

(Shrieks and howls.)

"Who will kill the sheep,

Or who will take care of the poor buffaloes?

(Shrieks and howls.)

"Who will carry the corn to the mill?

Who will beat us as you used to do,

Oh, Tanaz?"

(Shrieks and howls.)

Five minutes afterward an *araba*, with a couple of oxen or buffaloes, is brought round, containing a ladder, on which the corpse is placed without either shroud or coffin; but only two men accompany it, one to drive, the other to act as sexton; arrived at the cemetery, the body is thrown into the grave, a few spadefuls of earth thrown upon it, perhaps a stone is placed, and all is over. No burial-service is ever said, for although a minimum sum of forty piastres must be paid to the papas for every burial, he never appears, nor in any way officiates; if the family choose to have masses said for the soul of the dead, they must make a new bargain, but in the country it is not much the fashion.

The same evening there is a great death-feast of relations and friends in the house of mourning, which is repeated in ten days, and again at the expiration of one month, three months, six months, a year, and three years; these are called in Bulgarian *pominki*, commemorations. If the dead man leaves a widow, she goes to his grave every morning for forty days, and throws water over it, "so that he may not die of thirst." Besides the *pominki*, the Bulgarians hold a feast in the cemetery on Palm Sunday, and, after much eating and drinking, leave the remains upon the graves of their friends, who, they are persuaded, will eat them during the night; on Easter Monday an Easter-egg is placed on each grave.

The Bulgarian mourning, which is worn only by women, consists in wearing every article of clothing inside out; as with us, it varies in duration according to the consanguinity of the relation lost; that of a widow is fixed at one year.

### JAMES HARPER.

MR. JAMES HARPER, so almost universally known as the senior member of the distinguished publishing firm of Harper & Brothers, was recently thrown from his carriage, the injuries arising from the accident proving fatal two days later.

In the Franklin Square publishing-house there were four brothers, the eldest seventy-four years of age, and the youngest nearly sixty-six. For over fifty years these brothers have been associated together—at the beginning the two oldest as proprietors, and the younger as apprentices; but, since the year 1826, all united under the widely-known name of Harper & Brothers. Of the early struggles of these brothers the world knows little; of their brilliant successes it knows much. Beginning almost with the birth of our national literature, they have been its faithful aids; great reputations have been founded under their auspices; great geniuses recognized and developed; they have made not only wealth for themselves, but name and fortune for others.

Of the public spirit, business energy and sagacity, and unswerving integrity of the Brothers Harper, nothing need be said. They are recognized and admired by all who know them. Mr. James Harper was the founder of the business, and for many years its chief inspiration. He was a man of a singularly felicitous organization. The vivacity of youth never forsook him. At seventy-four years of age there was little to indicate the presence of age, the youthfulness of his appearance, indeed, seeming to promise a life of extraordinary length. Of active habits, peculiarly genial and animated in temperament, of abounding spirits, he united to the qualities of a courteous and honorable gentleman those of the cheerful Christian and the agreeable companion. He leaves hosts of earnest friends to mourn his memory.

### TABLE-TALK.

IT is by no means surprising that the subject of woman has taken a deep hold of public attention. Certainly, so far as a question can derive attractions from the interest of its subject, the woman-question has a quite incontestable supremacy over every other. Nor has it ever been otherwise. The literatures of all countries and of all times testify to the eminent place accorded to woman in the cultivated thought of the world. Alike the glory of chivalry, the life of romance, the soul of poetry, and the inspiration of art, she has been the regnant ideal in all the finer spheres of mental achievement. But all subjects change their aspects with the advance of thought. The forms of chivalry have passed away, and the romancing spirit is repressed by a new discipline in a period of absorbing practical inquiry; yet woman is still in the ascendant, though she comes before us now in a new phasis. Having been idolized, sung, and flattered through all the moods and tenses of poetic feeling, it seems at length her destiny to be soberly *considered*. The age is analytic and radical; it takes things to pieces, and goes down to their roots. In this temper its attention is drawn to woman—to her capacities, duties, and rights, and she thus becomes the subject of a question. But, if woman, as a theme of poetry, has never failed to be interesting, as a thesis of discussion she has a corresponding importance. The subject as now opened goes to the very roots of social order, and, in its settlement, if that be possible, it carries with it the settlement of a whole range of problems of the deepest moment to society. Our age presents no inquiry more important than that of the rights, education, and true position of the female sex. Whether the leaders of the movement comprehend the real gravity and difficulty of the work they have undertaken, is doubtful.

Recent strikes among workmen in various branches of trade have sent employers into the streets in search of apprentices. Their success has been very limited. There is a vast number of lads seeking clerkships; the mercantile, financial, and professional pursuits have greater accessions than they need; but the indisposition to enter the trades or take up the industrial arts is so marked, that, if it continue, we shall soon have a labor famine. Immigration, in fact, is the only thing that prevents it now. Every American boy expects to make his fortune in Wall Street, or to run for Congress, and disdains those pursuits that are not immediately conducive to these ends. It may be questioned, moreover, whether our public-school education is not in part responsible for this condition of things. Our system in educating children in ideas above their social level, in promoting literary rather than scientific culture, and in ignoring the industrial arts, is serving to paralyze the productive labor of the country at its very source.

Mr. Robertson's new comedy of "School," now acting so successfully in London, New York, and Boston, may be cited to disprove a common impression, that the stage of the period is entirely given over to sensation. This little comedy is almost a revelation in dramatic literature. With a plot very slight, with no stirring incident, almost without a situation, dealing, in a thoroughly realistic way, with ordinary life, it yet has achieved the greatest dramatic success of the season. This is to be attributed to its truthful characters, its charming pictures of life, and the highly skilful way in which ordinary incidents are rendered dramatic and effective. The public taste is not so low as it is continually asserted to be. In people's eagerness to be entertained, they are not always, it is true, discriminating. Their likings, moreover, are catholic, and the very persons who to-night are dazzled by the glittering splendors of a "Black Crook," to-morrow may be subdued by the simple pathos of a story like that of "School." The success of this play is proof of the popular sympathy for a pure and elegant drama, and de-

prives actors and managers of all excuse for offering the lewd, the coarse, or the sensational.

The women of America are usually supposed to possess an immunity from insult or molestation when travelling alone, or in other unprotected situations, that their sisters of other countries do not enjoy. But Lord Shaftesbury, at a ragged-school meeting in Sheffield recently, related an anecdote calculated to disprove this idea. In remarking that young ladies would be surprised to find with what respect they would be treated by the forlorn classes if they would go amongst them with a view to education, he said: "In one of the worst parts of London there was an institution which he visited. In one room he found about thirty-five men listening to the teachings of the daughter of a small shopkeeper in the neighborhood. She was one of the prettiest women he ever saw in his life. He noticed that there was no one present but the young woman with those rough men, and he said to the superintendent, 'Are you not afraid to leave my dear little friend alone with all those men?' He replied, 'I am.' 'Then why don't you go to her?' 'You mistake my fear. I am not afraid of their doing *her* any harm. They love her so much that they would lick the ground on which she walks; but I am afraid some person may step in, and, not being under authority, or knowing the manners of the place, may say something impertinent to her, and, if he did, he would not leave the place alive.'" There is a touching proof, in this incident, of the influence that the defenceless innocence of women will exercise on the roughest natures. When a general equality of rights, privileges, and duties shall have extinguished all that remains of chivalry for woman, will this influence remain?

### Literary and Personal Notes.

THE Paris correspondent of the *Morning Star* relates, upon the authority of Emile Ollivier, an anecdote of M. de Lamartine. "Lamartine," says the narrator, "being at the Hôtel de Ville, received the announcement that a deputation of Vesuviennes demanded an interview. These women, in type and brutality, strongly resembled the famous *poissardes* of the first Revolution. The doors of his cabinet were thrown open, and the apartment was presently filled by these fierce-looking dames, whose dishevelled locks and uncouth garb presented any thing but an attractive spectacle. M. de Lamartine bowed, and begged to know whether he could be of any service to his visitors. 'Citizen,' replied the foremost amongst them, standing with arms a-kimbo in front of her comrades, 'the Vesuviennes have resolved to send you a deputation to express their admiration of your conduct. There are fifty of us, and, in the name of all the Vesuviennes, we, fifty in number, have come to kiss you.' The poet gave one glance at the forest of unkempt hair and the rubicund cheeks of the fifty unwashed Venuses, and thus replied: 'Citoyennes, I thank you for the sentiments you inspire me with; but allow me to remark that patriots of your stamp are more than women—they are men. Men do not embrace each other. We shake hands.' And thus, by a stroke of the most subtle flattery, did the author of the 'Méditations' escape the fifty kisses of the *Mégères* of the Revolution of '48."

Mr. Burlingame, the American gentleman who now represents the Chinese empire abroad, seems to be enjoying himself in Paris, with his long-tailed followers. A clever paragraphist in a foreign paper speaks of them as "Burlingame's Bears, or the pig-tailed people who walk on their hind legs, and follow their leader about." It is said that at the Hôtel de Ville, one evening, the Chinamen gazed upon the buffet with expressionless eyes, but showed no symptoms of appetite. Soon, however, they paused before a heap of *marrons glacés*, and quickly devoured them all. More than once again, other heaps of the delicacy shared the same fate, and not enough could be found to satisfy the ravenous celestials. At the next ball at the Tuileries, the heavenly-minded people were again hunting for this luxury of the "outside barbarians," and, meeting the polite functionary who at the Hôtel de Ville had fed them, they surrounded him, and searched his pockets for their ambrosia.

In a notice of Col. Badeau's Military History of Gen. Grant, the London *Saturday Review* remarks that "the work is written with that soldierly respect for high qualities, even among the bitterest antagonists, which is the first characteristic of a good military history. Foreign im-

partiality may regret that the brave armies of the beaten cause should throughout be qualified as 'the rebels,' while the forces of the victorious majority are 'the national troops;' but the opinion of the North would perhaps hardly have tolerated a more courteously equivocal description, in any account of its favorite hero, that wished to be popular as well as true."

The French journals say that the post of President of the Senate—now vacant by the death of M. Troplong—was offered to Lamartine, and the emoluments of the office would have been doubled, in order that he might rid himself of his pecuniary embarrassments. He declined the appointment, however, and then an unconditional offer was made to free him from his debts. This he also declined.

Jean Jacques Offenbach is believed to be the richest composer in Europe. His fortune is estimated in French operative circles at upward of twelve hundred thousand francs. Ten years ago he was hardly worth twelve hundred francs. The rumor that M. Offenbach has a weakness for stock speculations at the Bourse is true; but, it is added, that he is an exceedingly lucky and successful speculator.

The Crown-Princess Victoria of Prussia, who is a very spirited and plucky young lady, had, the other day, an interview with some Hanoverian ladies of high rank, who extolled the courage displayed by their ex-queen at the time the Prussian troops entered the capital of Hanover in June, 1866. "Courage!" exclaimed the crown-princess, disdainfully. "If she were a really courageous woman, and if your people were so ardently devoted to her and to her cause, why did she not call upon the people of Hanover to rally around her, and defend her against the enemy? I am sure I would have done that."

It is said that Maurice Sand, George Sand's only son, though as a writer by far inferior to his illustrious mother, manages to make more money by his facile pen than the authoress of "Consuelo" and "Indiana."

One of the most delightful books of travel, recently published, is Mr. Leech's "Letters of a Sentimental Idler," from the press of D. Appleton & Co., discoursing pleasantly of a sojourn in the far East. The *New York Round Table* speaks of it as follows: "Like the cool breeze, that comes rippling over the waves gleaming with the golden sheen of the fading sunset, as they chase each other sportively till they dash on some ocean-girt shore, these letters from oriental climes have a fragrant freshness perfectly delicious. Sketches of character, bits of scenery, incidents of travel, echoes of Eastern song and tradition, are all portrayed with the vividness of an oil-painting and the minuteness of a photograph."

Madame Rossini, in compliance with the request which her husband addressed to her on his death-bed, continues his famous Friday dinner-parties at her villa in Passy. No more than a dozen guests are invited to them, and Rossini's chair is left vacant at its wonted place. The macaroni, however, which Rossini prepared in such an inimitable manner, has been banished from the dinner-table, Madame Rossini saying that her guests, being accustomed to the dish as prepared by her husband, should not eat an inferior article at her table.

Rosa Bonheur presented George Sand, on her recent birthday, with a portrait of the great French authoress, representing her as a young lady of twenty-five, and in the costume in which Mlle. Bonheur saw her when they met for the first time. This is the second portrait which Rosa Bonheur has painted.

The hostility of the French Government to M. Edmond About, which had led to inimical measures against the *Gaulois* and other papers for which M. About writes, is attributed to the influence of the Empress Eugenie, who asked the clever novelist and feuilletonist some time since to write a number of sketches about the prince imperial. Instead of complying with her Majesty's request, About has recently repeatedly alluded in his articles to the prince imperial in a manner not altogether eulogistic and complimentary; hence the wrath of the empress.

Count Bismarck recently told some of the German authors who are circulating a petition addressed to President Grant, and praying him to recommend to Congress the passage of an international copyright law, that he did not think the movement which they had originated was a very proper one. He said it might be considered impertinent by the Americans; as for himself, he certainly would not like to receive such a petition at the hands of the citizens of a foreign country. Several German authors of merit and distinction refused to sign the petition on similar grounds.

We have a striking pen-portrait of the old ex-Elector of Hesse-Cassel, drawn by a German correspondent who saw that remarkable prince, a few weeks ago, at his Bohemian Tusculum—Chateau Horschowitz: "Imagine a rather tall, very straight, and stiff-looking old man, in a kind of undress

uniform, which, however, sits very well on his thin and slender body. His hair is scant and gray; his face is regular, and might even be called handsome but for the stern expression of his lurking bluish-gray eyes, and the dogged expression playing around his lips, which he mostly keeps firmly compressed. Those who know his antecedents will not wonder at them when they see him. He looks like a perverse, obstinate, narrow-minded man, full of pride, and gifted with very few generous feelings."

Xavier Marmier, the French feuilletonist, recently saw the Grand-duchess hereditary of Russia, *the* Princess Dagmar of Denmark, and is in ecstasies about her beauty and grace. "What a lovely young creature!" he exclaims, in a letter to the *Revue de Paris*; "when I saw her, she was leaning on the emperor's arm, and shedding the light of her sweet presence even on that grave, gloomy, and taciturn man, who, though the sternest monarch in the world, seemed to feel exceedingly proud of his charming little daughter-in-law. She was chatting gayly with him, and he made every now and then a smiling reply to her, when her large, lustrous eyes fairly flashed with mirth and delight. I asked some one, if the little grand-duchess was popular in St. Petersburg. 'She is,' he replied. 'Why, every man here is in love with her.'"

Richard Wagner, the German composer, who has just finished his great operatic trilogy, "*Die Nibelungen*," will speedily commence writing a libretto based on one of Shakespeare's tragedies, and compose it for the Paris Grand Opera, which, he says, is bound to achieve a brilliant success, despite the failures of his "*Tannhäuser*" and "*Lohengrin*."

The profession of a public lecturer is more profitable in France than in England. Especially successful in France are half a dozen talented ladies who are at present lecturing in the principal provincial cities. Even in Paris, clever lecturers are nearly always, unless some very exciting event engrosses public opinion, sure of attracting large audiences. Hitherto the government has always tried to discourage these public lecturers; but the emperor said lately that the policy had been a very short-sighted one, and that the opposite course should henceforth be pursued.

Queen Victoria's book has been published in a Turkish translation at Constantinople.

## Matters of Science and Art.

PROFESSOR TYNDALL has lately developed some very curious and striking results by subjecting the rarefied vapors of volatile liquids to the action of the concentrated beam of the electric light in a horizontal glass tube. At the beginning of the experiment the tube seems perfectly empty, and is indeed almost a vacuum; but the chemical forces of the electric ray decompose the rarefied vapor, which is precipitated as visible clouds, and which assume the most remarkable aspects of color and form. Professor Tyndall says:

"In one experiment, a globe of cloud formed at the centre, from which right and left issued an axis which united the globe with the two adjacent cylinders. Both globe and cylinders were animated by a common motion of rotation. As the action continued, paroxysms of motion were manifested; the various parts of the cloud would rush through each other with sudden violence. During these motions beautiful and grotesque cloud-forms were developed. At some places the nebulous mass would become ribbed so as to resemble the graining of wood. In the anterior portion of the tube these sudden commotions were most intense; here buds of cloud would sprout forth and grow in a few seconds into perfect flower-like forms. The most curious appearance that I noticed was that of a cloud resembling a serpent's head; it grew rapidly; a mouth was formed; and from the mouth a cord of cloud, resembling a tongue, was rapidly discharged.

"Sometimes clouds presented the appearance of a series of concentric funnels set one within the other, the interior ones being seen through the spectral walls of the outer ones; those of the distant cloud resembled claret-glasses in shape. As many as six funnels were thus concentrically set together, the two series being united by the delicate cord of cloud. Other cords and slender tubes were afterward formed, and they coiled themselves in spirals around and along the funnels. The cords finally disappeared, while the funnels melted into two ghost-like films, shaped like parasols. The films were barely visible, being of an exceedingly delicate blue tint; they seemed woven of blue air. To compare them with cobweb or with gauze would be to liken them to something infinitely grosser than themselves.

"At one trial a spectral cone turned its apex toward the distant end of the tube, and from its circular base filmy drapery seemed to fall. Placed on the base of the cone was an exquisite vase, from the interior of which sprung another vase of similar shape; over the edges of these

vases fell the faintest clouds, resembling spectral sheets of liquid. From the centre of the upper vase a straight cord of cloud passed for some distance along the axis of the experimental tube, and at each side of this cord two involved and highly iridescent vortices were generated. The frontal portion of the cloud, which the cord penetrated, assumed in succession the forms of roses, tulips, and sunflowers. It also passed through the appearance of a series of beautifully-shaped bottles placed one within the other. Once it presented the shape of a fish, with eyes, gills, and feelers.

"A friend, to whom on one occasion I showed the cloud, likened it to one of those jelly-like marine organisms which a film, barely capable of reflecting the light, renders visible. Indeed, no other comparison is so suitable; and not only did the perfect symmetry of the exterior suggest this idea, but the exquisite casing and folding of film within film suggested the internal economy of a highly complex organism. The *twoness* of the animal form was displayed throughout, and no coil, disk, or speck, existed on one side of the axis of the tube, that had not its exact counterpart at an equal distance on the other. I looked in wonder at this extraordinary production for nearly two hours."

By the kindness of Professor Tyndall, the writer was recently allowed the opportunity of observing these beautiful and remarkable displays in the laboratory of the Royal Institution of Great Britain, a place which will ever be memorable in the annals of science, as the scene of the immortal discoveries of Davy and Faraday. But it was not merely the exquisite beauty and unique character of the visible effects which riveted the attention; it was as signalling the march of transformation—as a new disclosure of the hidden harmonies of Nature, that they were most deeply impressive. As the phenomena, here described, seem not yet to have received a designation, we suggest that they be associated with the name of their discoverer, and be known hereafter as the *Tyndallie Clouds*.

The success of Atlantic telegraphing is now so assured that new lines are inevitable. It was at first feared that they would neither last long, nor pay while they did last, but the reality is better than the hope. One has now been down three years, and the other four, yet they are now twenty times better in point of conductivity and insulation, their essential qualities, than when first laid; while their receipts of thirty-five hundred dollars a day in gold (over a million a year) savors strongly of profit. The French are accordingly hard at work upon a new ocean-cable, which is to be laid in June. It will leave the French coast a few miles from Brest, and proceed to the French island of St. Pierre, not far from Placentia Bay, Newfoundland; from this a second line passes to near Plymouth, on the Massachusetts coast. The total length of the French cable will be 3,564 nautical miles, or nearly double the length of the existing ocean lines.

The new cable is to be constructed on the same plan as the others, but stronger. The conducting copper case, formed of one strand of seven wires, will weigh four hundred pounds to the mile, and is therefore a quarter heavier than the one last laid. This conductor is wrapped in four folds of gutta-percha interlaid with four coatings of insulating compound, and round the whole will be twisted ten galvanized iron wires done up in Manila hemp, the whole to be saturated with tar. Its weight is thirty-one cwt. a mile in air and fifteen cwt. in water, and its breaking strain seven tons, so that it can support a length of nearly ten miles in the water; while the greatest depth of the track selected is but two and one-half miles.

There has been a rapid and immense improvement in the construction of ocean-cables. "The standard of the manufactured value of a cable is judged by what are called *its units of resistance*. There is always a certain amount of resistance to the passage of the electric current through the conductor, and the more perfect the insulation of the cable the greater that resistance will be. The amount of resistance is measured by the galvanometer, and is counted by millions of units. Thus, a cable which gave a resistance of only one million of units, would at once show that it was defective, and, by some hidden leakage, allowed the current to escape, and so, of course, allowed it to enter the wire faster than it could have done had it been so carefully insulated that all the electricity must have passed along the conductor, and along that only. But materials which absorb the current will also give rise to a low rate of resistance, and a low rate of resistance is only a scientific term for a bad cable." The Persian-Gulf cable had a standard of 50,000,000 units; the Atlantic cable, of 1865, of 100,000,000 units; that of 1866, 150,000,000 units; while the French cable is pitched at 250,000,000 units. It is curious that marine cables, like wine, cheese, and fiddles, improve by time—the Atlantic cables having gained so much in insulation that they are said to have often given last year a resistance of 4,000,000,000 units.

Sixteen hundred miles of the French cable were reported as being done on the first of February, and the manufacture is proceeding at the rate of two hundred miles a week. The Great Eastern, of course, will lay it.

## The Museum.

IN one of the cathedrals in Sicily the confessional happened to be so placed that the whispers of the penitents were reflected by the curved roof and brought to a focus at a distant part of the edifice. The focus was discovered by accident, and for some time the person who discovered it took pleasure in hearing, and in bringing his friends to hear, utterances intended for the priest alone. One day, it is said, his own wife occupied the penitential-stool, and both he and his friends were thus made acquainted with secrets which were the reverse of amusing to one of the party.

Thirteen substances belonging to the earth have been found, by spectrum-analysis, to exist also in the sun. M. Janssen has found lines, denoting aqueous vapor, in the atmospheres of both Jupiter and Saturn. Some very remarkable lines have been seen in the more refrangible part of the spectrum of Mars, supposed to be connected with his red color.

It is found that, at Philadelphia, the mean velocity of the wind, during the entire year, is eleven miles per hour; nine miles in summer and fourteen in winter. At Toronto its annual average velocity is nine miles per hour. The mean velocity of the wind at sea is estimated at eighteen miles per hour.—*Loomis*.

It is said that nervous diseases are on the increase among us, and that they are most frequent and most severe among brain-workers. That this impression is well founded there can be no question. Paralysis, neuralgia, hysteria, dyspepsia, hypochondriasis, and insanity, are certainly more frequent, both in this country and in Europe, than they were thirty or fifty years ago. In my own practice, I am continually amazed by the variety and subtlety of phase that these diseases assume even in the young and growing generation. But it is one of the compensations of these nervous disorders that they are not rapidly fatal, and that they protect the system against febrile and inflammatory affections that hurry the Indian, the negro, and the poor laborers of our own race, into early graves. This protective power of the nervous constitution was illustrated, over and over again, during the late war, when delicate exsanguined students resisted malaria and grew stout amid exposures that prostrated by thousands the lumbermen of Maine, and the sons of the plough and the anvil.—*Dr. Geo. M. Beard*.

Everybody knows that photographs are taken on cloudy days by diffused light or diffused chemical force. This effect is due to the reflection of rays by the particles of air, and, of course, the amount of this reflection depends upon the amount of the particles. Hence, on the summits of the Alps, where the air is thin, it takes a very long time to get a picture. During Mr. Glaisher's tenth balloon-ascent, simultaneous observations were made at Greenwich observatory and in the balloon, three miles high, when the standard paper, exposed to the full rays of the sun, was not as much discolored in half an hour as the corresponding paper at Greenwich in half a minute.

The mountains of the moon are immensely larger in proportion to its size than those of the earth. The moon is but 1-49th the size of the earth, but its mountain-peaks are nearly as high. The German astronomer, Maedler, has measured the height of 1,093 mountains in the moon. Twenty-two of these are higher than Mont Blanc, which is within a few

feet of being three miles high—six are above 19,000 feet. The highest observed mountain in the moon is 24,944 feet high, an elevation that is a little less than the loftiest peaks of the Andes, and a few feet more than four miles and a half. It is within 3,236 feet of the elevation of the loftiest peak on the earth.—*Dr. Mann*.

A thermometer which has been kept for seventy-five years in the vaults of the Paris Observatory, at a depth of ninety-one feet below the surface, has not varied more than half a degree during the entire interval.

The only condition necessary to the production of a musical sound is, that the air-pulses should succeed each other *in the same interval of time*. No matter what its origin may be, if this condition be fulfilled, the sound becomes musical. If a watch, for example, could be caused to tick with sufficient rapidity—say one hundred times a second—the ticks would lose their individuality, and blend to a musical tone. And if the strokes of a pigeon's wings could be accomplished at the same rate, the progress of the bird through the air would be accompanied by music. In the humming-bird the necessary rapidity is attained; and, when we pass on from birds to insects, where the vibrations are more rapid, we have a musical note as the ordinary accompaniment of the insect's flight. The puffs of a locomotive at starting follow each other, slowly at first, but they soon increase so rapidly as to be almost incapable of being counted. If this increase could continue until the puffs numbered fifty or sixty a second, the approach of the engine would be heralded by an organ-peal of tremendous power.—*Tyndall on Sound*.

## GORHAM MANUFACTURING CO.,

PROVIDENCE, R. I.,

STERLING SILVER WARE

AND

FINE ELECTRO-PLATED WARE.

This Company, having the most extensive and complete Silver-Ware Factory in the world, and employing the best talent in designing, modelling, and finishing, are, with the aid of ingenious and labor-saving machinery, enabled to produce in large quantities, and at the lowest prices, goods beautiful in design and unsurpassed in finish, the fineness of which they guarantee to be of sterling purity, U. S. Mint assay. A certificate is issued with all articles in silver, for the purpose of protecting purchasers from imitations of their designs.

They also continue to manufacture their well-known and unrivalled Nickel-Silver Electro-Plated Ware, which will last twenty-five years with fair every-day usage.

Orders received from the Trade only, but these goods may be obtained from responsible dealers everywhere.

Trade Mark  
for  
STERLING. Silver.

Trade Mark

Electro-Plate.

JUST PUBLISHED—A NEW NOVEL BY LOUISA MÜHLBACH.

## TWO LIFE-PATHS.

A ROMANCE.

BY LOUISA MÜHLBACH.

TRANSLATED FROM THE GERMAN BY NATHANIEL GREENE.

In one volume, octavo. Paper cover. Price 60 cents.

"What Scott has done for Scotland, what Bulwer, James, and Ainsworth have done for England, Miss Mühlbach has done for her Germany. She is an historical novelist by birth and education. She has that intense yearning for an accurate knowledge of the past, which alone can nerve up a man or a woman to the patient and toilsome studies necessary for its mastery. There is nothing too trivial for her to know exactly. To this rare habit of the mind, which would have fitted her to be a reliable historian, she adds a poetic and dramatic power, which would have won a high reputation in the walks of purely imaginative literature. The happy blending of these two sides of her nature makes her that rarest of all writers, the successful historical romancer."

Mailed, post-free, on receipt of price.

D. APPLETON & CO., Publishers, New York.

Entered, according to Act of Congress, in the year 1869, by D. APPLETON & CO., in the Clerk's Office of the District Court of the United States for the Southern District of New York.

No. 4.—WITH SUPPLEMENT.]

SATURDAY, APRIL 24, 1869.

[PRICE TEN CENTS.]

## THE MAN WHO LAUGHS; OR, BY THE KING'S COMMAND.

BY VICTOR HUGO.\*

### IX.

#### A CHARGE CONFIDED TO THE FURIOUS SEA.

THE master of the bark, who was at the tiller, broke out into a laugh.—A bell! That's good. We are driving to larboard. What does this bell prove? That we have land on our right hand.

The firm and measured voice of the doctor answered:

—You have not got land a-starboard.

—But, yes! cried the master.

—No.

—But this bell sounds from ashore.

—This bell, said the doctor, sounds from the sea.

There was a shudder among these hardy men. The haggard faces of two women appeared in the square of the cabin-hatchway, like two evil spirits evoked. The doctor made a step, and his tall, dark form detached itself from the mast. They heard the bell tolling in the depth of the night.

The doctor resumed:

—There is in the middle of the sea, half-way between Portland and the Channel Islands, a buoy, placed there to give warning. This buoy is moored with chains to the bottom, and floats on a level with the water. On this buoy an iron trestle is fixed, and at its intersection a bell is hung. In heavy weather, the sea being shaken, shakes the buoy, and the bell rings. That bell is the one you hear.

The doctor let a very heavy gust sweep by, waited till the sound of the bell was heard over all, and continued:

—To hear this bell in a storm, when the whirlwind blows, is to be lost. Why? Observe: if you hear the sound of the bell, it is the wind that brings it to you. Now the wind comes from the west, and the breakers of Aurigny lie eastward. You can only hear the bell, because you are between the buoy and the breakers. It is on these breakers that the wind drives you. You are on the wrong side of the buoy. If you were on the right side, you would have ample sea-room, in a safe course, and you would not hear the bell. The wind would not bring you the sound. You would pass near the buoy, without knowing that it is there. We are out of our course. The bell—it is shipwreck sounding the tocsin. Now, make the best of it!

The bell, while the doctor was speaking, lowered in tone by a lull of the blasts, sounded slowly, stroke after stroke; and this intermittent tinkling seemed to be suggested by the old man's words. It might have been termed the death-bell of the deep.

Breathless, they all listened; now to the voice, now to the bell.

### X.

#### STORM IS THE GREAT SAVAGE.

NEVERTHELESS, the master had seized his speaking-trumpet:—*Cargate todo, hombres!* Let fly the sheets! Rowse in upon your down-haul! Lower away the ties and brails of your courses! Hung up to the west! Let's take more sea-room! Head for the buoy! Head for the bell! There's sea-room away there! All isn't over!

—Try it, said the doctor.

Let it be noted in passing, that this sounding-buoy, a sort of sea-bell, was suppressed in 1802. Very old sailors remember having heard it. It gave warning, but somewhat late.

The master's order was obeyed. The Languedocian made a third sailor. Every one helped. They did better than brailing; they furlled. They tautened all the gaskets, they knotted the reef-points and bowlines; they put horse-irons on the stoops, which might thus serve as midship shrouds; they fished the mast; they nailed fast the port-lids, which is a way of walling-in the vessel. The manœuvre, although executed with the yards peaked, was none the less successful. The ork, in fact, was brought down to a complete state of readiness. But in proportion as the craft, making all snug, grew as it were smaller, the turning upside down of air and water increased upon her. The height of the danger attained almost polar dimensions.

The tempest, like an executioner who is hurried, took to quartering the vessel. There was, in the twinkling of an eye, a fearful wrenching of every thing, the topsails blown out of the bolt-ropes, the bulwarks cut down, the chess-trees thrown out of joint, the shrouds tangled in a heap, the mast sprung, all the hubbub of disaster flying into pieces. The bigger ropes parted, although they had only four fathoms' clinch.

The magnetic tension, incidental to snow-storms, aided the parting of the cordage. It broke, as much from the effects of this, as from the wind. Chains were jerked out of their pulleys and of no more use. The bows forward, and the quarters aft, bent under the enormous pressure. One wave carried away the compass, with the binnacle. Another carried away the boat, slung like a portmanteau under the bowsprit, after the strange Asturian fashion. Another carried away the sprit-sail yard. Another carried away the image of Our Lady at the prow, together with the fire-cage.

\* Entered, according to Act of Congress, in the year 1869, by D. APPLETON & CO., in the Clerk's Office of the District Court of the United States for the Southern District of New York.

There remained the rudder only. The place of the extinguished signal-light was supplied by a torch made of flaming tow and lighted tar, which was hung from the rudder-post.

The mast, snapped in two, all bristling with quivering tatters, with cordage, with tackling-blocks, and with yards, encumbered the deck. In falling, it had smashed a portion of the starboard bulwark.

The master, still at the tiller, shouted out:—As long as we can steer, nothing is lost. The lower planking holds good. Axes! axes! Overboard with the mast! Clear the deck!

Crew and passengers were fevered by this supreme struggle. It was but an affair of some blows with the axe. They hove the mast over the side. The deck was cleared.

—Now, said the master, take a halyard and lash me to the tiller.

They bound him to the helm.

While they were fastening him, he laughed. He called out to the sea:

—Bellow away, old woman, bellow away! I've seen worse off Cape Machichaco.

And, when he was securely tied, he grasped the tiller with both hands, with that delirious joy that peril engenders.

—All goes well, comrades! Hurrah for Our Lady of Bugeuse! Let us steer for the west!

A colossal cross-wave came, and flung itself down upon the after-body. There is always in tempests a sort of tiger-wave, ferocious, and bringing all to an end, that reaches a certain point, crawls sometimes as though on its belly along the sea, then bounds, roars, gnashes its teeth, pounces on the ship in distress and tears it to pieces. An engulfiner of foam covered all the poop of the *Matutina*; and in the midst of the water and the darkness was heard a rending asunder. When the foam was dissipated, when the stern reappeared, there was no more master, nor rudder.

All had been swept away.

The tiller and the man, that they had just bound together, had gone with the wave into the howling pell-mell of the tempest.

The chief of the band looked fixedly into the gloom, and exclaimed:

—*Te burlas de nosotros?\**

To this cry of revolt succeeded another cry:

—Let us let go the anchor! Let us save the master!

They ran to the capstan. They let the anchor go. Orks have but one. This led only to the losing it. The bottom was living rocks, the swell maddening. The cable snapped like a hair.

The anchor rested at the bottom of the sea.

Of the cutwater, there remained only the angel figure-head looking through his spy-glass.

From this moment, the ork was no more than a waif. The *Matutina* was irredeemably crippled. The vessel, but a while ago, winged and almost terrible in her course, was now impotent. Not a bit of rigging that was not mutilated and out of gear. Unresisting and passive, she obeyed the weird furies of the waters. It is on the ocean alone that one sees, in some few minutes, an eagle transformed into a being paralyzed and helpless.

The breathing of space became more and more monstrous. The tempest is horrible in the way of lungs. It unceasingly aggravates the blackness that has no light and shade. The mid-sea bell rang furiously, as though shaken by a furious hand.

The *Matutina* drifted on at the mercy of the waves; a cork has similar undulations. She no longer sailed; she merely floated. She seemed ready, every instant, like a dead fish, to turn up her belly to the surface. That which saved her from total loss was the good condition of the hull, that was per-

fectly water-tight. Not a plank beneath the water-line had given way. There was neither crack nor crevice, nor a drop of water in the hold. Fortunately so, for the pump was damaged, and could not be of any use.

The ork danced hideously in the anguish of the waves. The deck had convulsions, as the diaphragm when it strains to vomit. One might have said that it strained to eject the doomed men. They, inert, clung to the standing-rigging, to the bulwarks, to the carlings, to the davits, to the gaskets, to broken places in the started planking, to the useless riders, the nails of which tore their hands, to all the miserable shreds of ruin. From time to time they listened. The sound of the bell grew more feeble. It might have been said that it, too, was in *extremis*. Its tolling was no more than an intermittent rattle. Then the rattle itself died away. Where were they, then, and how far from the buoy? The noise of the bell had scared them. Its silence terrified them. The nor'wester made them take a course perhaps irreparable. They felt themselves carried away by a frantic blast of breath. The wreck swept on rapidly in the blackness. Than a blind swiftness, nothing is more frightful. They felt the precipice before them, under them, above them. It was no more a course; it was a fall. Abruptly, amidst the tumult of the thickened snow, a red spot appeared.

—A light-house! cried the unhappy men.

## XI.

### THE CASKETS.

It was in fact the light-house on the Caskets. A light-house in the nineteenth century is a high cylindrical and bell-shaped work of masonry, surmounted by a lighting apparatus altogether scientific. That on the Caskets, at this day, is a triple white tower, and bearing three tiers of lights. These three fire-houses revolve and pivot on clock-work wheels with such precision, that the man on watch, who observes them from the offing, invariably takes ten steps in his walk on deck during the irradiation, and twenty-five during the eclipse. All is calculated in the focal plane, and in the rotation of the octagonal drum formed of eight broad simple lenses one over the other, and having, above and below, its two series of dioptric rings—algebraic gear guarded against gusts of wind or shocks of the sea by glass windows one millimetre in thickness, yet sometimes broken nevertheless by sea-eagles that throw themselves against it, great moths of these giant lanterns. The masonry that encloses, upholds, and serves as a setting for this mechanism is, like it, mathematical. All is sober, exact, unadorned, precise, correct. A light-house is a numeral figure:

In the seventeenth century, a light-house was a highly ornamental object on land beside the sea. The architecture of the tower was magnificent and extravagant. Upon it were lavished balconies, balustrades, little turrets, small lodges, alcoves, weathercocks. There was nothing but masks, statues, foliage, volutes, round bosses, figures and little figures, modillions, with inscriptions. *Pax in Bello*, said the Eddystone light-house. Let us look at it in passing. This declaration of peace did not always disarm the ocean. Winstanley repeated it on a light-house that he erected, at his own expense, on a wild spot before Plymouth. The building completed, he placed himself in it, for the purpose of trying it against a storm. The storm came, and carried off the light-house and Winstanley. For the rest, these exaggerated buildings offered on all sides a hold for the wind-gusts, as generals too much bedizened are apt to attract the bullets in battle. Besides their fantasies in stone, there were fantasies in copper, in wood; the iron-work made relief, the carpenter's work made projections. Everywhere, on the outside of the building, fastened to the wall among the arabesques, implements of all kinds figured abundantly, the useful and the useless, winches, tackling, pulleys, balance-weights, ladders, cranes for loading, grappling-

\* "Are you making game of us?"

irons in case of accident. On the top, around the lighting-chamber, delicately wrought iron-work supported large chandeliers of iron, in which were junks of cable steeped in rosin, wicks that burned tenaciously, and that no wind could extinguish. And from top to bottom the tower was covered with maritime standards, with streamers, with banners, with flags, with pennons that mounted from staff to staff, from stage to stage, amalgamating all the colors, all the forms, all the blazons, all the signals, all these varieties, up to the radiated cage, and made in the storm a joyous flutter around the flaming centre. This effrontery of light on the very verge of destruction was as it were a defiance, and inspired shipwrecked mariners with audacity. But the Caskets Light-house was not of this fashion.

It was then a simple, old, and rude affair, such as Henry I. had caused to be constructed after the loss of the *Blanche Nef*—a burning pile under a trellis-work of iron on the crown of a rock. Live coal behind a grating, and a long-haired flame in the wind.

The only improvement made in this light-house since the twelfth century was a forge-bellows moved by a chain and hook with stone weights, which had been adjusted to the fire-cage in 1610.

The flight of sea-birds against these antique light-houses was more tragical than with those of our day. The birds flocked thither, attracted by the brilliance, threw themselves upon it, and fell into the brasier, where one might see them flutter, as it were, black spirits agonizing within their hell. Sometimes, too, they fell upon the rock outside of the red-dened cage, smoking, limping, blinded, like flies half-burned by the flame of a lamp.

To a vessel under sail, well found, provided with all the appliances of gear, and manageable by the pilot, the Caskets' light is useful. It cries, "Take care!" it warns him of the rock. To a disabled ship it is simply terrible. The hull, paralyzed and inert, without means of resisting the insensate action of the water, without defence against the pressure of the wind, a fish without fins, a bird without wings, can but go whither the blasts may hurry her. The light-house indicates to her the supreme locality, signalizes the place for annihilation, throws a gleam upon the spot for swallowing up. It is the candle over the tomb.

There is no more tragic irony than this lighting-up the inexorable yawning, this warning against the inevitable.

## XII.

### HAND TO HAND WITH THE ROCKS.

THE poor wretches in distress on board the *Matutina* took in at once this mysterious derision, the supplement of shipwreck. The appearance of the light-house cheered them at first, then overwhelmed them. There was prayer to be uttered; nothing to be done. What has been said of kings may be said of the waves. We are their people; we are their prey. All that they rave, we undergo. The nor'wester drove the ork with the currents upon the Caskets. Thither went they; there was no refusal. They drifted rapidly upon the reef. They felt the bottom rising up toward them. The lead, if lead could have been used, would not have given them more than three or four fathoms. The poor men listened to the rumbling engulfment of the waves within the hollows of the deep rock below the surface. They could make out above the light-house, like a dark strip between two bands of granite, the narrow strait of the hideous, small, and savage haven, that they surmised as full of men's skeletons, and the carcasses of ships. It was a cavern's mouth, rather than the entrance of a port. They heard the crackling of the fire high above them in its iron cage; a haggard purple hue illuminated the storm; the meeting of the flame and the hail troubled the mist; the black cloud and the red smoke combated, serpent against serpent; a whirl of

embers flew upon the blast; the snow-flakes seemed to take to flight, before the rude attack of sparks. The breakers, indistinct at first, now outlined themselves clearly, a jumble of rock, with peaks and crests and vertebrae. Its angles modelled themselves in living lines of vermillion, and the declivities in bloody patches of light. As they came on, the contour of the rock grew larger, and rose higher in sinister relief.

One of the women, the Irish one, told off her beads distractedly.

In lack of the master, who was the pilot, there remained the chief, who was now captain. The Basques are all familiar with mountain and with sea. They are bold climbers, and inventive on occasions of catastrophe.

They came; they almost touched. All at once they were so close to the great north cliff of the Caskets, that suddenly it shut out the light-house. They could see it only, and the glare behind it. This rock, upright in the haze, resembled a tall woman in black with head-dress of fire.

This crag of evil omen is named the Biblet. It stands on the north, over against the rock, corresponding with another on the south, the Etacq-aux-Guilmetts.

The chief looked at the Biblet, and cried out:

—A willing hand here to carry a line to the breakers! Is there any one here that can swim?

There was no answer.

Not a soul on board knew how to swim, not even the sailors; a peculiarity, by the way, common enough among seafarers.

A carling, almost detached from its fellows, oscillated in the planking. The chief grappled it with both hands, and said:

—Help me here!

They detached the carling. It was at his disposition, to do what he would with it. From being defensive, it became offensive.

It was a beam sufficiently long, in solid oak. Sound and strong, fit for serving as an engine of attack, or a means of support, a lever against a heavy weight, a battering-ram against a tower.

—Stand by, cried the chief.

They ranged themselves, six in number, buttressed against the stump of the mast, holding the carling horizontally overboard, and straight as a lance toward the projecting part of the rock.

The manœuvre was perilous. The idea of pushing against a mountain is audacity. The six men might be thrown into the water by the rebound.

These are the diversities of the struggle with a tempest. After the squall, the reef; after the wind, the granite. One has to deal, now with the unseizable, now with the immovable.

It was one of those minutes in which the hair turns white. The rock and the vessel were about to fall foul of each other.

A rock is passive. It awaited.

A wave broke in, disorderly. It put an end to the waiting. It took the ork underneath, lifted it up and balanced it for a moment, as the sling balances the projectile.

—Hold fast! shouted the chief. It is only a rock; we are men.

The beam was at poise. The six men were a part of it. The jagged pegs of the carling lacerated their arm-pits; but they did not feel it.

The wave threw the ork upon the rock.

The shock took place.

It took place under the shapeless cloud of foam, that always covers up these catastrophes.

When the cloud fell back into the sea, when between wave and rock the normal condition was restored, the six men were rolling on the deck, but the *Matutina* was flying along the length of the breaker. The beam had held firm, and forced a deviation. In a few seconds, the hurrying-on of the surges

being maddened, the Caskets were astern of the ork. The *Matutina* was, for the moment, out of immediate danger.

This does happen. It was the direct crash of his bowsprit against the cliff that saved Wood, of Largo, at the mouth of the Tay. In the rude latitudes of Cape Winterton, and under the command of Captain Hamilton, it was by manœuvring a similar lever against the redoubtable Brannodu-um rock that the *Royal Mary* escaped wreck, though she was but a frigate after Scottish model. The wave is a force so suddenly decomposed, that to divert it is easy, or at least possible, even in concussions the most violent. There is something of the brute in the tempest. The hurricane is the bull, and he can be put off his cue.

Endeavoring to pass from the secant to the tangent—all the secret of escaping shipwreck lies therein.

This was the service that the carling had rendered to the ork. It had done the duty of an oar; it had held the place of a rudder. But this liberating manœuvre once performed, it could not be recommenced. The beam was gone. The violence of the collision had made it leap overboard from the grasp of the men, and it was lost in the waters. To unloosen another plank was to dislocate all the ribs.

The hurricane carried off the *Matutina*. All at once the Caskets appeared as a useless encumberment on the horizon. Nothing has more the air of being put out of countenance, than a rock on the like occasion. There is in Nature, on the side of the unknown, there where the visible and the invisible are complicated, a fixed and soured aspect, as though indignant at a prey let go.

So looked the Caskets, while the *Matutina* fled away.

The light retreated, grew pale, grew white, and then went out.

This extinction was rueful. The thicknesses of the mist overlaid the flaming, now diffused. The rays of light were dilated in the immensity of moisture. The flame floated, struggled, buried itself, lost form. You might say that it was drowned. The brasier became a candle-end; it was no more than a trembling, vague and wan. All around, a circle of extravasated light grew larger. It was as though light were crushed out in the clutches of night.

The bell, which had been a threat, was silent; the light-house, which had been a threat, had vanished. Nevertheless, when these two menaces had disappeared, it was even more terrible. The one was a voice, the other a torch. They had something human in them. In their absence, remained the abyss.

### XIII.

#### FACE TO FACE WITH THE NIGHT.

THE ork found itself in measureless obscurity.

The *Matutina*, escaped from the Caskets, went down from billow into billow. Respited, but engulfed. Driven crosswise by the wind, acted on by the thousand tractions of the water, she repelled all the maddened oscillations of the waves. She scarcely pitched any longer, fatal sign of a vessel's distress. Waifs can only roll. Pitching is the convulsion of the conflict. The helm can only act when the vessel is propelled.

In a tempest, and especially in a meteoric snow-storm, the sea and night conclude by merging and amalgamating, and by becoming one and the same exhalation. Mist, whirlwind, blast, gliding in every sense, no point of support, no place of mark, no breathing-spell, a perpetual recommencement, one opening after another, no horizon visible, profound recoiling—in all this the ork was wafted on.

Getting clear of the Caskets, eluding the rocks, this had been a victory for the poor mariners. But, above all, a stupefaction. They had given vent to no hurrahs; at sea, imprudences of this sort do not happen twice. To throw a provocation, where one could not throw a lead-line—this is serious.

To have repelled the rock was to have accomplished the im-

possible. They were astounded at it. By degrees, however, they began to hope. Such are the irrepressible loomings-up of the soul. No trial is there which, even at the most critical instant, does not see its gloom illuminated by the wonderful uprising of hope. These poor wretches asked no more than inwardly to avow that they were saved. They stammered it to themselves.

But a formidable object grew vast before them, all at once, in the night. To larboard, uprose, defined, and cut itself out of the background of mist, a lofty mass, opaque, vertical, right-angled, a tower standing square in the abyss.

They looked at it, open-mouthed.

The blast impelled them toward it.

They knew not what it was. It was the rock Ortach.

### XIV.

#### ORTACH.

THE reef recommenced. After the Caskets, Ortach. The tempest is no artist; it is brutal and all-powerful, and does not vary its means.

Darkness is not to be exhausted. It is never at the end of its snares and its perfidies. Man, himself, quickly reaches the extremity of his resources. Man expends himself; the abyss does not.

The wretched men turned toward their chief, their hope. He could only shrug his shoulders, the sullen disdain of impotence.

The rock Ortach is a graved spot in the midst of the ocean. All of one piece, lifted above the opposing shock of the surges, it rises vertically eighty feet. Ships and the waves shiver themselves upon it. An immutable cape, it plunges perpendicularly its rectilinear sides into the countless and waving curves of the sea.

At night, it figures as an enormous headsman's block, posed upon the folds of vast black drapery. In a storm, it awaits the stroke of the axe, that is to say, of the thunder-clap.

But never is there clap of thunder in the whirlwind of snow. The ship, it is true, has a bandage over its eyes; all possible darkness is bound fast upon it. It is ready, as though for the executioner. As for the thunderbolt, which were a prompt ending—there is no room to hope for it.

The *Matutina*, being no more than a stranded object afloat, moved on toward this rock as she had moved on toward the other. The unfortunate ones, who for a moment believed themselves saved, reentered into anguish. The wrecking which they had left behind them, reappeared before them. The rock rose up again from the bottom of the sea. Nothing was done.

The Caskets are honeycombed into a thousand compartments; the Ortach is a wall. To be wrecked upon the Caskets is to be cut in pieces; to be wrecked on the Ortach is to be ground small.

There was, however, one chance.

Upon these bold fronts—and the Ortach is a bold front—the wave has no more ricochet than a bullet would have. It is reduced to a simple game. It comes in a breaker, and returns a ground-swell.

In such cases, the question of life and death resolves itself into this: if the billow casts the vessel on the rock, she is broken up, she is lost; if the surf retreats before the vessel touches, it brings her back, she is saved.

Poignant anxiety. The victims saw in the haze the vast supreme wave approaching them. When would it near them? If it broke upon the vessel, they would be impelled upon the rock, and shattered to pieces. If it passed underneath the vessel...

The wave did pass underneath the vessel.

They breathed.

But what of its return? What would the swell make of them?

The swell bore them away.

Some minutes later, the *Matutina* was clear of the waters about the rock. The Ortach grew indistinct, as the Caskets had grown indistinct.

It was the second victory. For the second time, the ork had been on the very verge of wreck, and had recoiled in season.

## XV.

### GIGANTIC CAPRICES.

MEANWHILE a thickening of the mist had come down upon these hopeless ones adrift. They knew not where they were. They could scarcely see a few cables' length around the ork. Despite a veritable stoning by the hail which forced them all to hold down their heads, the women were determined not to go down again into the cabin. Never a wretch in despair, who did not prefer to be wrecked under the open sky. So near to death, a ceiling above one seems to be a foretaste of the coffin.

The swell became more and more short. This short swell indicates compression; in foggy weather certain rippings are signs of a strait. In fact, unknown to themselves, they were coasting along Aurigny. Between Ortach and the Caskets on the west, and Aurigny on the east, the sea is bound in and cramped, and a fretted state for the sea determines locally the conditions of the storm. The sea suffers, like any thing else; and then, where it suffers, it becomes irritated. This pass is held in terror.

The *Matutina* was in this pass.

Let any one imagine, below the water, a turtle-shell as large as Hyde Park or the Champs Elysées, of which each longitudinal mark is a hollow, and each embossment a reef. Such is the western approach of Aurigny. The sea covers over and hides this contrivance for shipwreck. Over this callapash of submarine breakers, the wave, broken into shivers, leaps and foams. In calm, a ripple; in storm, chaos.

The poor fellows noticed this new complication, without explaining it to themselves. Suddenly, they comprehended it. There was a partial lighting up at the zenith, and a slight pallor spread itself over the water; this lividness unmasked on the larboard hand a long bar running crosswise to the east; and toward this a furious gust of wind was driving, as it chased the vessel before it. This bar was Aurigny.

What was this bar? They trembled. They would have trembled far more, if a voice had answered them—Aurigny!

No island defended against the coming of man, like Aurigny. It has, above water and under water, a ferocious guard, whereof Aurigny is the sentinel. Toward the west, Barhou, Sauteriaux, Aufroque, Niangle, Fond-du-Croc, les Jumelles, la Grosse, la Clanque, les Equillons, le Vrac, la Fosse-Malière; toward the east, Sauquet, Hommeau Floreau, la Brinebetais, la Quesalique, Croquelibore, la Fousche, le Saut, Noire Pute, Coupie, Orbue. What are all these monsters? Hydras? Yes; of the rock species.

One of these reefs is called le But, as if to indicate that every voyage ends there.

This encumberment of rocks, simplified by the water and the night, appeared to the hapless men under the plain form of an obscure line, a black streak on the horizon.

Shipwreck is the ideal of impotence. To be near the land, and unable to reach it; to float, and to be unable to sail on; to have a foot on something that appears solid, and is fragile; to be full of life and full of death at the same instant; to be a prisoner in extended space; to be walled in between sea and sky; to have the infinite above one as a dungeon; to have around one the immense breakings-loose of gusts and of waves; and to be seized, garroted, paralyzed—this weight of burden stupefies and makes indignant. You fancy that you recognize the sneers of some inaccessible combatant. That, which holds

you fast, is the very same that lets go the birds, and gives the fish their liberty. This seems nothing, and it is every thing. You are dependent on this air, that you can disturb by a breath; dependent on this water, that you can hold in the hollow of your hand. Draw from this tempest a glassful—it is but a small embittered draught. A mouthful—it is nausea; the billow—it is extermination. The grain of sand in the desert, the flake of foam in the ocean, are giddy manifestations. The all-power takes not the trouble to conceal its atoms; it makes feebleness force; it fills the nothingness with its all; and it is with the infinitely little that the infinitely great overwhelms you. It is with its drops that the ocean crunches you. You feel yourself a plaything.

A plaything; how terrible the term!

The *Matutina* was a little above Aurigny, which was in her favor; but she drifted toward the northern point, which was fatal. The wind, northwest, just as a bent bow lets fly an arrow, launched the craft toward the northern cape. There exists at this point, a little on this side of Havre de Corbeleta, what the seamen of the Norman archipelago call a "singe."

The "singe"—*swinge*—is a current of the furious order. A chaplet of funnels in the shoals produces in the waves a chaplet of whirlpools. When one lets you go, another takes hold of you. A vessel, snapped up by the "singe," twirls about, therefore, in one spiral after another, until some sharp-pointed rock pierces her hull. Then, burst asunder, she stops; the stern rears itself out of the water; the bow plunges; the whirlpool completes its turn of the wheel; the stern drives downward, and all is closed again. A puddle of foam enlarges itself and floats, and one only sees upon the surface a few bubbles here and there, caused by stifled respirations beneath the water.

In the whole Channel, the three most dangerous "singes" are, the one that is near the famous sand-bank, Girdled Sands, the one that is at Jersey, between le Pignonnet and the point of Noirmont, and the "singe" of Aurigny.

A local pilot, had there been one on board the *Matutani*, would have made her crew aware of this new peril. In place of a pilot, they had instinct; in extreme situations there is a second-sight. Wreaths of foam were flying high along the coast, under the maddened pillaging of the wind. This was the spitting of the "singe." In this ambush many a ship has capsized. Without knowing what was there, they drew near with horror.

How double this cape! There was no expedient.

Just as they had seen the Caskets rise up, then Ortach rise up, at present they saw the point of Aurigny, all of high rock, stand before them. These were as giants, one following the other. A series of fearful duels.

Charybdis and Scylla are only two; the Caskets, Ortach, and Aurigny, are three.

The same phenomenon of the horizon invaded by rock reproduced itself with grandiose monotony. The battles of the ocean, like the battles of Homer, have their sublime repetition.

Each billow, as they drew near, added twenty cubits to the headland, frightfully amplified in the mist. The decrease of interval appeared more and more without remedy. They touched the skirts of the "singe." The first fold that seized them would drag them down. One more wave, and all would be ended.

All at once the ork was thrust astern, as though by a blow from a Titan's fist. The billow reared up beneath the vessel and turned upon itself, throwing back the waif in its crest of spume. The *Matutina*, under this impulsion, got clear of Aurigny.

The sport of agony, she found herself once more in the offing.

Whence came this help? From the wind.

The breath of the storm had changed its direction.

The water had been playing with them. Now it was the turn of the wind. They had disengaged themselves from the Caskets: before Ortach, the action of the sea had brought about

a revolution; before Aurigny, it was the north-wind. There had been a sudden shift from north to south.

The sou'wester had succeeded the nor'wester.

A current is the wind in the water; the wind is the current in the air. These two forces had come into contact, and the wind had the caprice to withdraw its prey from the current.

The abrupt movements of the ocean are inexplicable. They form a perpetual perhaps. When at their mercy, one can neither hope, nor despair. They make; they unmake. The ocean amuses itself. All shades of animal ferocity are, in this vast and cunning sea, which Jean Bart called "the gross beast." It is the clutch of a sharp claw, with intervals, at will, of velvet handling. Sometimes the storm finishes a shipwreck off-hand. Sometimes it gets one up with care—it might almost be said, with caresses. The sea has its own time. Those, who are at the point of death, perceive this.

Sometimes, let it be said, these delays in execution announce deliverance. Such instances are rare. Be that as it may, dying men are prompt to believe in safety; the smallest abatement in the threats of the tempest is sufficient for them; they affirm to themselves that they are out of danger; after deeming themselves buried, they are ready to avail themselves of a resurrection; they accept feverishly that they are not yet in actual possession; it is evident that all their evil chances are exhausted; they declare themselves satisfied; they are saved; they hold God quits. But it is well not to be in too great haste to give these receipts to the Unknown.

The sou'wester made its debut in a whirlwind. Seamen in distress have none but crabbed auxiliaries. The *Matutina* was impetuously dragged away by what remained of her rigging, as a dead woman by her hair. This was like the deliverances accorded by Tiberius, at the cost of violation. The wind brutalized those whom it saved. It did them service, in a fury. Its help was without pity.

The wreck, in this liberating roughness, completed its utter dislocation.

Hailstones, of large size and hard enough for loading a swivel, crippled the vessel. At each surge of the waves, these hailstones rolled along the deck like balls. The ork, as it were between two waters, lost all form under the batterings of the waves and the foaming of the spray. Every one on board looked out for himself.

He who could, clung to something. After each swash of the sea, they wondered to find their number still complete. Several had their faces torn by splinters from the wood-work.

Happily, despair has stout fists. A child's hand, in terror, has the grip of a giant. Agony constructs a vice out of woman's fingers. A young girl, under the influence of fear, would dint her rosy nails into iron. They caught at every thing, they held on, they got hold again. But each billow brought with it the agony of keeping their balance.

All at once, they were relieved.

## XVI.

### THE ENIGMA SUDDENLY RELAXES.

THE tempest had stopped short.

In the air, there was no more either of sou'wester or nor'wester. The infuriate clarions of space were silenced. The whirlwind passed away out of the atmosphere, without previous diminution and without transition, as though it had slid down perpendicularly into an abyss. They knew no longer where it was. Flakes had replaced the hailstones. The snow began again to fall leisurely.

No more swell. The sea flattened itself.

These sudden cessations are common in hurricanes of snow. The electric effluvium being spent, all becomes tranquil; even the wave, that in ordinary storms keeps up, above all, a protracted agitation. Not so here. No prolonging of anger in the waters. Like a laborer after fatiguing work, the sea mod-

erated all at once, which is almost a contradiction of statistical laws, but which never astonishes veteran pilots, for they know that the ocean is subject to all manner of surprises.

At the expiration of some minutes, it was calm all around the ork.

At the same time, for the last phase resembles the first, one can no longer distinguish any thing. All, that had become visible during the convulsion of meteoric clouds, again became obscure; the wan outlines melted away and were diffused; the gloom of the infinite gathered from all sides about the vessel. This wall of night, this impenetrable circle, this inner side of a cylinder whose diameter grew less from minute to minute, enveloped the *Matutina*, and, with the sinister slowness of an iceberg that is forming, formidably contracted itself. At the zenith, nothing—a lid of mist—an enclosure. The ork was as though at the very bottom of an abyss.

In this pit, a puddle of liquid lead; that was the sea. The water stirred no more. A gloomy immovableness. The ocean is never more fierce, than when a pool.

All was silence, stillness, blindness.

The silence of things partakes, perhaps, of the nature of taciturnity.

The last ripples glided along the sides. The deck was horizontal, with imperceptible declinations. Some disjunctures stirred feebly. The grenade-shell that took the place of the signal-lantern, and in which the tow steeped in pitch was burning, trembled no longer on the bowsprit, and threw no more its flaming drops into the sea. What there was of breath remaining in its shower of sparks made no noise. The snow fell, thick, soft, and scarcely oblique. They heard the foaming of no more breakers. The peace of gloom.

This repose, after these exasperations and these paroxysms, was, for the hapless ones so long tossed about, an unspeakable well-being. It seemed to them that they ceased to be put upon the rack. They saw around them and above them a willingness that they should be saved. They regained confidence. All that had been fury was now tranquillity. This appeared to them the signing of peace. Their miserable chests dilated. They could let go the end of the rope or the plank they had been grasping, could rise up, straighten themselves, keep themselves standing upright, walk, move about. They felt themselves inexpressibly calmed. In the hidden depths of these heavenly changes, there was preparation for something else. It was clear that they were, beyond peradventure, out of the squalls, out of the foam, out of the blasts, out of the raging, set free.

Henceforward, all chances were in their favor. In three or four hours it would be daylight, they would be seen by some passing ship, they would be picked up. The worst was over. They were coming back into life. The important fact was, their having been able to keep afloat until the close of the storm. They said to themselves: "This time it is over!"

All at once they perceived that all, in fact, was over. One of the sailors, a northern Basque, named Galdeazun, went down into the hold, to look for some cordage; then came up, and said:

—The hold is full.

—Of what? asked the leader.

—Of water, replied the seaman.

The chief cried out:

—What's the meaning of that?

—The meaning is, answered Galdeazun, that in half an hour we shall founder.

## XVII.

### THE LAST RESOURCE.

THERE was a rift in the keel. A leak was sprung. At what moment? No one could say. Was it in coming alongside the Caskets? Was it before Ortach? Was it in the plashings of the shallows west of Aurigny? The most probable solu-

tion was, that they had touched the "Singe." They had received an unexplained stab. It was not heeded amid all the convulsive blows that had shaken them. In lock-jaw, one does not feel a prick.

Another sailor, the southern Basque, who called himself Ave-Maria, went down in his turn into the hold, came up again, and said: "The water is two *varas* deep."

About six feet.

Ave-Maria added:

—In less than forty minutes, down we go.

Where was the leak? It was not visible. It was drowned. The body of water, that filled the hold, hid the rift. The vessel had a hole in her belly, somewhere below the floating-line, indeed far below the careening line. Impossible to find it. Impossible to plug it. There was a wound, but they could not dress it. The water, however, was not coming in very fast.

The leader cried out:

—We must pump.

Galdeazun replied:

—We have no more pumps.

—Then, rejoined the chief, let us get to land!

—Land? Where?

—I don't know.

—Nor I.

—But it is somewhere.

—Yes.

—Let some one take us there, continued the leader.

—We have no pilot, said Galdeazun.

—Take the tiller, you.

—We have no more tiller.

—Let's rig one up with the first spar we can lay our hands on. Nails! A hammer! Quick! Tools!

—The carpenter's chest is overboard. We have no more tools.

—Let's steer, all the same; no matter where!

—We have no more rudder.

—Where is the boat? Let's jump into it! Let's row!

—We have no longer a boat.

—Let's row the hull!

—We have no more oars.

—Up sail, then!

—We have no more sails, and no more mast.

—Let's make a mast out of a carling! Let's make a sail out of a tarpaulin. Let's get out of this. Let's trust ourselves to the wind.

—There is no more wind.

The wind, in fact, had left them. The storm had gone away; and this departure, which they had taken for their salvation, was their loss. The sou'wester, if still blowing, would have driven them madly upon some coast, would have gained upon the leak by swift movement, would have carried them perhaps to some good propitious sand-bank, and would have grounded them before they went down. The rapid hurrying away of a blast might have caused them to drive ashore. No wind, no hope! They were dying from the absence of the hurricane!

The supreme situation was before them.

The wind, the hail, the squall, the whirlwind, are disorderly combatants whom one may overcome. The tempest may be taken, in lack of armor. There are resources against violence that unceasingly lays itself bare, makes false moves, and gives many a side blow. But there is nothing to be done against a calm. No relief that one can lay hold on.

The winds are an attack by Cossacks; hold your ground, and they disperse. A calm is the torturing pincers of the executioner.

The water, not rapidly, but without interruption, irresistible and heavy, mounted in the hold; and, in proportion as it mounted, the ork descended. This was very slowly.

The crew of the *Matutina* felt opening beneath them, little

by little, the most hopeless of catastrophes, the passive. The still and ominous certainty of the unconscionable fact took hold of them. The air did not oscillate, the sea was not dreaming. The immovable is the inexorable. The swallowing up held them in silence. Athwart the mass of speechless water, without anger, without passion, without wishing it, without knowing it, without interest therein, the fatal centre of the globe was attracting them. Horror, in quiescence, amalgamated them with itself. It was no more the yawning mouth of the ocean, the double jaw of wind and sea wickedly menacing, the grinning of the whirlwind, the spuming appetite of the surge; it was one knows not what dark gaping of the Infinite beneath these miserable men. They found themselves entering into a peaceful profundity, that was death. The extent of hull, that their craft still showed above water, was diminishing—nothing more. They could calculate at what minute she would be effaced. It was the very reverse of submersion by a rising tide. The water did not mount toward them; they descended toward it. The digging of their tomb was their own act. Their own weight was the grave-digger.

They were executed, not by the law of men, but by the law of things.

The snow was falling, and, as the vessel moved not, this white lint was converted into a cloth upon the deck, and covered the ork with a winding-sheet.

The hold grew heavier and heavier. No means of overcoming the leak. They had not even a scoop for baling, which, besides, would have been an absurdity, and useless, the ork being decked. They lighted themselves up. They set fire to two or three torches, that they planted in holes, and as they might. Galdeazun brought some old leather buckets. They undertook to stanch the hold, and ranged themselves in file; but the buckets were past service, the leather of some had been sewed and sewed again, the bottom of others was burst through, and the buckets emptied themselves on the way. The inequality was ludicrous, between what was received and what was rendered. A ton of water entered; a glassful was discharged. They had no more success than this. It was the miser's disbursement, trying to spend a million, penny by penny.

The leader said:

—Let's lighten the wreck!

During the storm they had secured the several chests that were on deck. These had remained lashed to the stump of the mast. They undid the lashings, and rolled the chests overboard through one of the breaches in the bulwarks. One of these boxes belonged to the Biscayan woman, who could not refrain from groaning thus:

—Oh, my new cape lined with scarlet! Oh, my poor open-work stockings, with birch-bark pattern! Oh, my silver earrings for going to mass in Mary's month!

After clearing the deck, there remained the cabin. It was much encumbered. It contained, you may remember, the passengers' baggage, and also sundry bales belonging to the sailors.

They took away the baggage, and got rid of all that load, by the breach in the bulwark.

They drew up the bales, and pushed them overboard.

They completed the emptying of the cabin. The lantern, the mast-head cap, barrels, sacks, buckets, the larder and the pot with the soup, all went overboard.

They unscrewed the screws of the iron stove, the fire in which had been long extinguished; they unbedded it, they hoisted it on deck, they dragged it to the breach, and they precipitated it off from the vessel.

They pitched into the water every thing that could be detached, of loose planking, of riders, of shrouds, and of rigging smashed up.

From time to time, the leader took a torch, held it over the figures marking the draught that were painted on the stem, and noted how near they might be to foundering.

## XVIII.

## THE SUPREME RESOURCE.

THE floating wreck settled a little less, but settled continuously.

Despair as to their situation found no more resource or palliative. The last expedient had been exhausted.

— Is there still any thing else to be thrown overboard? cried the leader.

The doctor, whom no one thought of any more, came out from a corner of the companion-way, and said:

— Yes.

— What? asked the chief.

The doctor replied:

— Our crimes.

There was a shudder, and they all exclaimed:

— Amen!

The doctor, standing up and turning pale, raised a finger to heaven, and said:

— To your knees!

They trembled, which is the first step toward kneeling:

The doctor resumed:

— Let us cast our crimes into the sea. They weigh us down. This is what is sinking the vessel. Let us think no more of being saved, but of salvation. Our last crime especially, the one which we have only just committed, or I should rather say completed—O wretched listeners, this it is that overwhelms us. It is impious insolence to tempt the abyss, when one leaves a murderous intention behind. What is done against a child is done against God. I know that embarking was a necessity, but it was none the less sure perdition. The storm, warned by the shadow that our action has cast, is come. It is well. For the rest, have no regret. Yonder we have, not far from us, in this obscurity, the sands of Vauville and Cape la Hougue. That is France. Spain was the only possible asylum. France is not less dangerous for us than England. Our rescue from the sea would have ended in the gibbet. To be hung, or drowned; we had no other choice. God has chosen for us. Let us render Him thanks. He accords us the tomb that washes out. Brethren, the inevitable was therein. Think that it was we who, a while ago, did all we could to transport thither on high that child, and that at this very moment, now while I am addressing you, there is perhaps a soul above our heads that accuses us, in presence of a Judge who watches us. Let us profit by this latest respite. Let us force ourselves, if still it may be so, to repair, in so much as depends on us, the evil that we have done. If the child survives us, let us come to his aid. If he dies, let us strive that he may pardon us. Let us remove this heinous sin that overhangs us. Let us unload this burden from our consciences. Let us do our best, that our souls be not swallowed up before God, for terrible is the shipwreck therein. The body goes to the fish, the soul to demons. Have pity on yourselves. To your knees, I tell you. Repentance is the bark that does not founder. You have no longer a compass. I mistake. You have prayer.

The wolves became sheep. These transformations occur at times of agony. It may happen that tigers lick the crucifix. When the dark door stands ajar, belief is difficult. Non-belief is impossible. Howsoever imperfect may be the divers outlines of religion essayed by man—even though the belief be void of form, even though the contour of the dogma does not harmonize with the lineaments of eternity as imperfectly seen—there is, at the supreme moment, a quivering of the soul, the commencement of something after life. Such is the pressure of agony.

The dying moment is the falling due of a bill. At this fatal instant, one feels the coming home of a diffused responsibility. That which has been complicates that which will be. The past returns, and enters into the future. The known becomes an abyss, no less than the unknown; and these two precipices—

one fraught with our faults, the other with our doom—mingle together their reverberations. It is the confusion of these two chasms, that terrifies the dying man.

They had made their last outlay of hope on this side of life. For that reason, they turned to the other side. No chance remained to them, but in this shadow. This they understood. It was an awful glimmering of light, followed all at once by a falling back into horror. What one comprehends at the last moment is like what one sees during a flash of lightning. Every thing; then, nothing. One sees; and one sees no more. After death, the eye will reopen, and that which was a flash of lightning will become a sun.

They shouted to the doctor.

— You yourself! you yourself! There is no one but you. We will obey you. What must be done? Speak!

The doctor answered:

— We have to do with passing over the unknown precipice, and with reaching that other boundary of life which is beyond the tomb. Being the one among you best informed, I am the most in peril, of all. You do well to leave the choice of the bridge to him who carries the heaviest load.

He added:

— Science sets a price upon the conscience.

Then he went on:

— How much time is still left us?

Galdeazun looked at the draught-mark, and answered:

— Rather more than a quarter of an hour.

— Good, said the doctor.

The low roof of the companion, on which he was leaning, made a sort of table. The doctor took from his pocket his inkhorn and his pen, and his portfolio, whence he drew forth a piece of parchment, the one on the back of which he had written, some hours before, a score of lines uneven and set close.

— A light, said he.

The snow, falling like the foam from a cataract, had put out the torches one after the other. One alone remained. Ave-Maria took it up, and came and took his place, standing by the doctor's side, and holding the torch.

The doctor replaced the portfolio in his pocket, put his pen and his inkhorn upon the companion, unfolded the parchment, and said:

— Listen.

Then, in the midst of the ocean, on this hulk diminishing in size, as it were the shaking floor of a tomb, began a reading gravely made by the doctor, and whereto all the darkness seemed to listen. All these condemned men bowed their heads around him. The flaming of the torch accentuated their pallor. What the doctor read was written in English. At intervals, when some one of these doleful countenances appeared to desire an explanation, the doctor stopped, and repeated in French, in Biscayan, in Spanish, or in Italian, the passage that he had just read. Stifed sighs were heard, and dull beatings of the breast. The floating wreck continued to bury herself.

The reading ended, the doctor laid the parchment flat upon the companion, took up his pen, and upon a blank margin that he had left at foot of what he had written, signed his name:

DOCTOR GERNARDUS GEESTEMUNDE.

Then, turning to the others, he said:

— Come, and sign.

The Biscayan woman drew up, took the pen, and signed. ASUNCION.

She passed the pen to the Irishwoman, who, not knowing how to write, made a cross.

The doctor, by the side of this cross, wrote:

— BARBARA FERMOY, of *Tyrryf Island, in the Hebrides*.

Then he handed over the pen to the leader of the band.

The leader signed, GAIDOYRA, chief.

The Genoese, below the chief, signed, GIANGIRATE.

The Languedocian signed, JACQUES QUATOURZE, called the NARBONNESE.

The Provençal signed, *LUC. PIERRE CAPGAROUPE, from the galleys at Mahon.*

Underneath these signatures, the doctor wrote this note :

Of the three men of the crew, the master having been swept away by a sea, there are only two remaining, and they have signed.

The two sailors affixed their names below this note. The Biscayan of the north signed, *GALDEAZUN.* The Biscayan of the south signed, *AVE-MARIA, thief.*

Then the doctor said :

— Capgaroupe.

— Here, said the Provençal.

— You have got Hardquanonne's gourd ?

— Yes.

— Give it to me.

Capgaroupe drained the last drop of the brandy, and handed the gourd to the doctor.

The increase of the water in the hold became more marked. The wreck sunk deeper and deeper into the sea.

The inclined edges of the deck were covered with small ripples that grew larger.

All were grouped about the vessel's sheer.

The doctor dried the ink of the signatures by the torch, folded up the parchment in folds narrower than the diameter of the bottle's neck, and thrust it into the gourd. He cried out :

— The cork.

— I don't know where it is, said Capgaroupe.

— Here's the end of a rope, said Jacques Quatourze.

The doctor corked the gourd with the rope's end, and said :

— Some pitch.

Galdeazun went forward, took a handful of tow, and with it unhooked the grenade-shell, which was dying out, from the stem, and carried it to the doctor half full of boiling pitch.

The doctor plunged the neck of the gourd into the pitch, and drew it out.

The gourd, that contained the parchment signed by all of them, was corked and pitched.

— All is over, said the doctor.

And from all mouths went forth, vaguely stammered in various tongues, the lugubrious murmur of catacombs.

— So be it !

— *Meâ culpâ !*

— *Asi sea ! \**

— *Aro rai ! †*

— Amen !

One might have imagined that one heard sombre voices of Babel reëchoing through the gloom, at the fearful refusal of Heaven to hear them.

The doctor turned his back upon his associates in crimes and despair, and took a few steps toward the side. Having reached the edge of the wreck, he peered into the Infinite, and said with deep accent :

— *Bist du bei mihr ? ‡*

He was speaking probably to some spectre.

The wreck was going down.

Behind the doctor all were dreaming. Prayer is an irresistible force. They did not bend, they folded themselves. There was something of the involuntary in their contrition. They hung down, as a sail hangs down when there is no breeze ; and the haggard group assumed by degrees, with clasped hands and foreheads lowered, the attitude, varied but crushed, of a despairing confidence in God. It were hard to say what solemn expression, borrowed from the gloom, was outlined on these sinister faces.

The doctor returned to them. Whatever his past, the old

man was great in presence of the final issue. The universal reticence around preoccupied, without disconcerting him. It was the man, who is not taken by surprise. There was upon him a tranquil horror. The majesty of God comprehended was in his countenance.

This ruffian, aged and thoughtful, had, without suspecting it, assumed a pontifical aspect.

He said :

— Pay attention !

He looked out for a moment into space, and added :

— Now we are about to die.

Then he took the torch from the hands of Ave-Maria, and shook it.

A flame sprang from it, and passed away into the night.

And the doctor threw the torch into the sea.

The torch went out. All brightness vanished. There was no longer any thing but the immense unexplored obscurity. It was in some respects as though the tomb was closing.

In this eclipse the doctor was heard to say :

— Let us pray.

All fell upon their knees.

It was no longer in the snow ; it was in the water that they knelt.

They had no more than some few minutes.

The doctor alone remained standing up. The flakes of snow, as they fell upon him, starred him with white tears, and made him visible against the background of darkness. He might have been called the speaking statue of the dusk.

The doctor made the sign of the cross, and raised his voice, while beneath his feet began that rocking motion, almost indistinct, which precedes the instant when a wreck is about to plunge down. He said :

— *Pater noster, qui es in cœlis.*

The Provençal repeated in French :

— *Notre Père qui êtes aux cieux !*

The Irishwoman took it up in the Welsh tongue, understood by the Biscayan woman :

— *Ar nachair ata ar neamlh.*

The doctor continued :

— *Sanctificetur nomen tuum.*

— Hallowed be Thy name, said the Provençal.

— *Naomhthar hainm,* said the Irishwoman.

— *Adveniat regnum tuum,* pursued the doctor.

— Thy kingdom come, said the Provençal.

— *Tigeadh do rioghachd,* said the Irishwoman.

The kneelers had the water up to their shoulders. The doctor went on :

— *Fiat voluntas tua.*

— Thy will be done, lisped out the Provençal.

And the Irishwoman and the Biscayan woman ejaculated this cry :

— *Deuntar do thoil ar an Hhalâmb !*

— *Sicut in cœlo, sicut in terrâ,* said the doctor.

No voice made response.

He closed his eyes. All the heads were submerged. Not one of them had stood up. They had allowed themselves to be drowned, kneeling.

The doctor took in his right hand the gourd, which he had laid upon the companion, and raised it above his head.

The wreck went down.

As it sunk, the doctor murmured the rest of the prayer.

His bust was above water for a moment, then his head, then nothing more than his arm holding the gourd, as though he were showing it to the Infinite.

The arm disappeared. The deep sea had no more wrinkles than a ton of oil. The snow continued to fall.

Something was swimming, and floated away in the shadows. It was the gourd, corked and pitched, that its wicker covering had kept up.

\* "So be it !"

† "Well and good !" (Roman *patole*.)

‡ "Art thou near me ?"

## SPRING FLOWERS.

THE loveliest flowers the closest cling to earth,  
 And they first feel the sun: so violets blue,  
 So the soft, star-like primrose, drenched in dew,  
 The earliest of spring-time's fragrant birth,  
 To gentlest touches sweetest tones reply.  
 Still humbleness, with her low-breathed voice,  
 Can steal o'er man's proud heart and win his choice  
 From earth to heaven with mightier witchery  
 Than eloquence or wisdom e'er could own.  
 Bloom on, then, in your shade-contented bloom,  
 Sweet flowers! nor deem yourselves to all unknown.  
 Heaven knows you, by whose gales and dews ye thrive;  
 They know, who one day for their altered doom  
 Shall thank you, taught by you t'abase themselves and live.

## GRACE DAWSON.

OUR heroine was not at all pretty. Family traditions said that she was born in Boston—the city celebrated for being the hub from which the spokes of the universe radiate.

The mother of Grace died in those early years of which children keep no memory, and God no record against them. Her father had failed in business in New England, and when his half-brother, Jonathan Wilde, moved to Philadelphia, Mr. Dawson yielded to the suggestion that three playmates and a mother would be better for Grace than his own desolate New England hearthstone, and the little girl dwelt thenceforth on the banks of the Delaware.

Her uncle sent the bills for her clothing to her father, and received pay for allowing her to eat and sleep with his children, at about that shade under boarding-house rates, covered by the advantages of her being "permanent and not particular." Many an older victim finds out, when too late, that the fiction of being made "entirely at home," implies the utter neglect which a domestic might, perforce, submit to, without any of the kindnesses a child might expect.

Of her father, Grace saw but little, as it was understood that he was trying to recover his broken fortunes by the usual Wall Street efforts, in New York City. His labors did not seem to amount to much, and her uncle, Jonathan, had more than once rebuked the gift of some substantial article of dress or jewelry to Grace, on the ground that the father could not afford such extravagance.

Her board and school, and store-bills, had always been promptly paid, but there seemed, ever-present with the family of which she was an inmate, an impression that some such payment might be the final one; even if her father did not follow up this criminal domestic default, by applying to borrow money. Little of any definite nature was ever said, but her two beautiful cousins, Irene and Fanny, always treated her with the sort of condescension due to a poor relation. Her aunt and uncle, always incidentally mentioned at the breakfast-table, when a month's bills were due, and the little boarder felt a nervous presentiment that if her father ever did try to borrow money of her well-to-do uncle, there would be some little difficulty about retaining or obtaining a house-girl, and she would quietly fall into that position.

John was the oldest child and the boasted genius of the family, and it was considered quite a favor to be asked to wait on him in such little matters as finding a book or bringing a hat or umbrella.

Time, for all of these people, had passed on in the most commonplace of ways, until one day in the early summer of 1865. That morning the face and form of Grace were framed in one of the lower windows of the red-brick house, with its contrasting trimmings of white marble, that stood in the upper part of Chestnut Street. On looking down, she saw her uncle coming hastily up the street, at an hour much earlier than usual. She disappeared from the window, to open the hall-door, and was told to dress speedily, to take the next train for New York. A telegram had been received from her father, stating that he was somewhat ill, and wished to see his daughter and half-brother as soon as possible. He had removed from his lodgings, on Eleventh Street, down to the St. Nicholas, and they were to meet him there.

An hour later, the two were whirling over the Camden and Amboy Railroad, and, about dusk, alighted from a Broadway stage at the ladies' entrance of the great marble pile, which was their destination.

Our heroine had little time to decide whether she liked it better than the Continental or not, or whether she could endure the crowd of the great metropolitan way after the quiet streets of Philadelphia; for she was soon standing by the bedside of the father she had seen but once before, in that year, and who was evidently dying.

We fear her silent tears were a little embittered by the thought of how much disturbed her uncle and aunt would be, if the next month's bills were not paid when due.

No passing-bell helped to swell the ceaseless din of the city, which filled all things with its steady jar, and the man retained his strength of voice and intellectual faculties to the last. Only the nameless something which falls like a shadow from the spread wings of death, on the face of the dying, told that the soul had begun to withdraw from its chrysalis of clay.

Besides the two new arrivals, there were no persons in the room, save the physician and a gray-haired stranger of portly form, kind face, and seemingly of some fifty-five years of age. Grace had been too long accustomed to subdue her emotions to be very demonstrative even in her grief, and little was said before the man who was hovering on the confines of two worlds asked attention to his closing business in this one, for which—as much as to have his child with him in his last moments—he had desired her to come.

Much to the surprise of Jonathan Wilde, Mr. Dawson began to speak of having accumulated ten thousand dollars as his interest in a partnership with the gray-haired gentleman, whom he mentioned as his friend Mr. William Mann. Mr. Wilde had known that a little room up-stairs, at the corner of Broad Street and Exchange Place, near Wall Street, had been the den which Mr. Dawson called his office. He, indeed, had once been in it, without, however, seeing Mr. Mann, who, it seems, had all along been the partner in the rent, as well as in the profits, which had not been supposed to exist. It was easy enough in the great city, where no one concerns himself to know what his neighbor is doing, to accumulate much more than the few thousands mentioned, and just as easy to lose it all in a day as to gain it by the toil of years. Mr. Dawson had been fifteen years in New York, and Grace was now seventeen years old.

A simple will had been drawn up, leaving the ten thousand dollars with Mr. Mann, and also a bond to Grace from the latter, to pay interest on the money at six per cent., which would give six hundred dollars a year, and pay the few customary expenses of his daughter as usual. At her marriage, or expressing a wish to settle to herself, after the age of twenty, the entire sum was to be paid to her. After this disposal of his property, and a little gift to each of the two nieces, Irene and Fanny, it seemed a little useless for the will to go on, and, in a separate clause, make his daughter sole heiress of his property, and Mr. Mann the executor—said property seeming to consist in the old leather trunk standing near the bed, and the rather seedy overcoat hanging in the closet. Mr. Wilde took it to be the mere pretext of the lawyer to spin out the writing, and make show enough for his fee. His thoughts were running in another channel, and at length shaped themselves into the question, "Would it not be better, brother, to pay the money over to me, and let me do the best I can with it, for Grace? You know I am a good manager, and have made thirty or forty thousand while you were making ten."

"I have thought of that," said the dying man, "but a man of your standing could borrow money for business use at less than six per cent. outside of the fluctuations of currency. The expenses of Grace are nearly six hundred dollars a year, and, as Mr. Mann proposes to pay that, it will perhaps save a tax on your own purse. Besides, it is now invested in our old business, and Mr. Mann gives security."

Seeing nothing to reply, Mr. Wilde made none, and then Mr. Dawson said that he felt his end was very near, and he would like to see his daughter alone for a little while.

All the others went to one of the parlors, and father and child were left with no witness to their last interview, save the waiting angel—Death.

The gentleman lay quiet a few moments, with eyes closed, hands folded, and lips moving as if in prayer, and, when at length he spoke, his voice was so clear and strong, that, to have heard and not seen him, one would have supposed he had yet many years to live.

"My daughter," he said, "listen attentively, and think calmly, on

what I am about to say. I have loved you as I did the mother you never knew; not for beauty, but for the patient, loving heart you inherited from her. I am perhaps singular in the way I have chosen to manifest my love, and probably unwise, in that I might have failed. Your mother said, in dying, that she hoped you would some day be lifted above the wearing anxieties of common poverty, or, at all events, saved from the actual want of the necessities of life, on the brink of which condition she and I then stood. When I placed you with your uncle, I hoped, by self-denial and labor, to fulfil her dying wish in less time than the fifteen years that have brought you up to womanhood. I have succeeded, and if I do not live to share it with you, I shall, at least, have a pleasant word to tell your mother when she asks me of her child. But wealth is not happiness, and I have thought how to shield you from one of the evils which may make fortune more miserable a condition than penury. If you marry, I would have it for love, and the few thousands mentioned in my will are not enough to tempt any one greatly to belie the promptings of his own heart; while the fact that you are known to have something, might decide some worthy man who would hesitate between his love for you and your necessary poverty with him. I have known Mr. Mann for years, and, even if he were not honest, I have secured my real estate by deed to you."

Grace started at this word, and looked in half-fear lest his mind was now wandering. He saw the look, but it seemed to remind him only of a question he wished to ask, for he said, "Have you any lover now?"

"I have not even a male friend," was her reply; and he continued:

"I have invested one hundred and fifty thousand dollars in real estate, such as stores and building-lots, in this city and Brooklyn, and all the deeds are wrapped up with a picture of your mother and her letters to me before we were married, in an old leather pocket-book, or note-case. You will find it under the false bottom of that old trunk. My partner, Mr. Mann, is the agent to receive the rents and see to the insurance, and no one but he and I and the revenue officers know that I have more than the little money still in the business. He is richer than I am, for he gave me my start after I failed in Boston. Few can keep a secret; and, in informing you that you are rich, and that, for your own happiness, it is as well not to seem so for some years, I recommend that you make no confidants. Has your experience of the treatment of a poor girl taught you to agree with me?"

"Oh, indeed it has, father," she said, as the blinding tears half hid from her the kind face she had yet so little time to see.

"Then keep the trunk as for your own use; make a memorandum of where and when the deeds were recorded, in case of their loss by accident, and let your uncle and aunt and cousins share the belief of the world, that I leave you with a mere support."

Could he have read her heart, as she lay with her cheek against his, it would have gladdened his own to know how much even the six hundred a year had lifted the fear from her heart, that she would be left a poor dependent on unwilling charity. After all, many a clergyman of good talents and expensive education, has supported his family for a lifetime on six hundred a year, and died with no power to bequeath the little sum to his destitute children.

After a brief pause, he kissed her twice tenderly, and then said—"Call the others, I shall soon be gone." They were summoned, and he pressed the hand of each, and looked an affirmative answer to the questioning gaze of his old friend, which seemed to say, "Does she approve?"

After an interval, the pale lips moved, and a voice much weaker than that which had spoken to his daughter, said, "Lord Jesus, receive my spirit." Then the leaden seal of mortality slowly pressed itself down upon the face, and the soul passed out into that boundless space, where we may hope its Creator still has it in his holy keeping.

Others performed the last rites for the dead, but Grace sat there, when the cold hand was released from hers; too much benumbed by the sudden events, to act or think, or even weep such tears as relieve the heart by exhausting its fountains. The light from the one window, dimmed by the dust of Broadway, fell upon her slight, girlish form, in the plain gray travelling dress; on the white hands where the plain gold ring was, the father's gift; on the bowed head, with its straight, unrippling hair of pale brown, with a tinge of what her cousins called red; on the forehead too high for beauty, and the fair face that, with all her care to avoid the sun, would show an occasional

moth spot, or freckle; on the dark gray eyes and regular features; on the occasional tear that trickled down her cheeks; thus did the pale sunlight fall, as if the bending heavens were sending down rays of comfort. The poor sad girl was an orphan and an heiress. Half of this fact was conveyed to the city of Penn in the telegram of Mr. Wilde. The other half he did not know.

The "dust to dust" was consummated in that beautiful city of the dead—Greenwood; and Grace, again returned to her home, could not but feel that the sympathy of her aunt and cousins was all the kinder; that its future developments could be insured to the amount of six hundred a year.

Not a spark of triumph or tinge of bitterness was there, however, in the orphan girl's heart; and, when again in her quiet room she knelt in that pure robe of the night in which women, like angels, approach their Maker, the sweet words of "Give us this day our daily bread" blent only with the thought of gratitude that God had given to her keeping so much of the bread others must share; and the solemn "Thy will be done" included even that long visit of her father to her mother, where he could give to her that "pleasant word,"—Grace is not left destitute.

The year 1865 had quenched its inverted torch upon the threshold of 1866, and Grace had finished her school-days, only to be more often seen at the window of the brick and marble house on Chestnut Street; and looking much as she did on the day when her uncle brought the telegram from her father; only she now dressed in black.

There was a little change at home. The monthly bills were not mentioned at periodical times, at the breakfast-table. Her dresses were no longer brought home by her two cousins, with the air of making gifts, and handed over with the remark, "That will make up nice for you." She had risen to the dignity of shopping, and bought with ready money. The house girl could be taken or dismissed with no dread of her hearing,—"Grace, dear, you would not mind attending to those rooms, would you, until we get another girl?" Cousin John had discovered that he could sometimes find his own things, and also that the playing and singing of cousin Grace was rather good for a school-girl.

Her new guardian, Mr. Mann, had thrice been to see her, and once taken her and her cousins to New York, to see the Central Park, and the neat marble monument over her father's grave at Greenwood.

Besides this, however, there had been no appreciable change, and, when her guardian had asked her if she needed more money, and offered to contrive a way for the rents of her property to be placed at her disposal, she only accepted a little addition to the fund she had reserved for charity, and still lived on less than the six hundred, in her accustomed way. In the visit to New York, there had been a kind of telegraphic signal agreed upon between Mr. Mann and herself, which, when given on the occasion of entering certain stores on upper Broadway, or passing certain vacant Brooklyn lots, signified—"This is yours." To that extent her woman vanity yielded, no more.

At the beginning of the long vacation of Harvard University for 1866, John Wilde was to graduate, at the age of twenty-three, and the visit to Boston on that eventful occasion by the whole family had long been anticipated with pleasure.

In the spring of that year, an event had occurred to deepen and intensify the growing affection of Grace for the family of her uncle, and to satisfy her that with all the closeness and penuriousness of her aunt, there was yet in some not often reached depth of her nature, a well-spring of genuine kindness and charity. A young German girl, named Dora Mayer, had long been a servant in the family, and Grace learned from the tea-table conversation that she had been detected in purloining some small articles of plate. But great was the surprise of our heroine to learn that not only was the culprit to escape exposure and punishment, but that Mr. Jonathan Wilde had actually secured her a place among some Germans who were going to service in the South, and advised her to go beyond the temptations of city life. The aunt half won the heart of Grace by saying, "Do not show that you know it, Grace dear, for she feels badly enough as it is." She quite won it a few days later by stooping over the orphan and saying, after a motherly kiss, "I fear I have not been all that a mother would have been to you, but should you ever have any trouble, or any thing pressing on your mind, you will find no more attentive ear, or warmer sympathy, than in your seemingly cold aunt."

The tears sprang to the eyes of her auditor, and Grace never could

tell why the impulse to confide to her aunt the secret of her father's death-bed, was repressed. We only know that the secret was not then told.

The long-expected commencement occasion at length arrived, and the Wilde family, Grace included, were in Boston. Bunker-Hill Monument had been climbed, and the sights of Washington and Tremont Streets had been exhausted, and, on the eventful day when cousin John was to deliver his maiden speech, Grace was one of the happiest of the party driving across the bridge to Cambridge.

One set of collegiate exercises is too much like all others, to merit description, and fans, summer toilets, and cool beauty in muslin,—inter-checked with male humanity, perspiring and in mourning,—were the prominent features of the audience. John Wilde had graduated with high honor, and had a composition in Latin, besides a brilliant speech, in which he glowingly pictured the progress of civilization, and the useful and fine arts, during the past century. Snowy handkerchiefs waved at its close, and there was the soft pattering of kid gloves at the telling passages—the refinement of applause, as if the hands kissed in ecstasy.

One pale student, however, divided the attention won by this popular young gentleman. He had none of the confidence or city manner that made others graceful, and his attire betrayed the fact that he patronized other than fashionable tailors. His theme was *eloquence*, and he seemed not so much to describe and define it as to *feel* it.

At the close, when he bent forward in that indescribable approach by which the greatest advocates are wont to magnetize their juries, and his eye seemed to rest unconsciously on the form of a venerable clergyman, known and loved in all New England, his words were so impressive as to start tears to more than one bright eye.

"Eloquence, like genius, is not acquired, but *born*. Its subject may partake of the smell of the lamp, and the labor of the laboratory or the office; and it may borrow much from action and from cultivation. Yet—more intangible than air, and more subtle than the lightning—it may rise beyond the preparation, the occasion, and the inspiration, and speak from the eye, melt from the tongue, and glow from the very presence of the man who *feels*. As for her chosen and peculiar home, it is the pulpit. The senate and the rostrum may lure her with the golden pomp of earthly honors, but, in the sacred oratory of the pulpit, the voice of true eloquence speaks in nobler accents and more fervid tones than ever startled the Grecian Ecclesia or shook the Roman Forum. 'There stands the legate of the skies, *his* theme divine, *his* office sacred, *his* credentials clear. By him, the violated law speaks out its thunders; and through him, in tones as sweet as angels use, the gospel whispers peace!'"

There was no applause to follow this, but there was sympathy and feeling.

The next day her cousin John invited Grace to a sail with him on the bay, in a boat belonging to one of his Boston classmates; and she thought him wondrously improved, with his air of mature manhood, and his delicate and unusual courtesies to her.

She was ready to accept his apology for his parents, that they were only now realizing that she was no longer a child; but she was utterly overwhelmed by his florid avowal of a love for her as old as his memory, and his declaration that his parents had long hoped for the union. They were not full cousins, which he was thankful for, as some were opposed to family intermarriages, and, if she would only consent, the love-home pictured by the pretended prince, as he told Pauline, of the Lake of Como, would be poor to that this Claude Melnotte would conjure up for her.

She listened in surprise, but accepted him in the matter-of-course kind of a way in which she had always obeyed rather than granted his requests. That the brilliant and handsome John Wilde should ever fancy her, was as astounding as if some fairy had suddenly gifted her with his clear complexion, hazel eyes, and brown curls. He was too rich to care for her little ten thousand; too popular with lovely women to be attracted by her moderate good looks, and, while she could not understand it, she thought her father would be pleased, if he knew it. This must be all for love.

Much as this new theme must have interested her, it did not prevent the rather sudden and *mal-à-propos* question,—“Who was that young student who spoke yesterday on eloquence?” He looked annoyed, but replied, “His name is Richard Vane. He is a poor fellow educated by some Southern church for the ministry, and had been

to some Southern schools, and two years in a theological seminary there, before he came to Harvard. He will spend his life on a salary as poor as one of his own church mice, but might make a passable lawyer if he was not bent on preaching at once.”

He then changed the subject to his own prospects, and said he had half a mind to go South himself, and buy a plantation among the broken-down chivalry. She laughed at that, and the sail was soon terminated by a return to their hotel, and preparations for a return to Philadelphia.

Much to her delight, the subject of the engagement was little spoken of, after the kisses and embraces of her uncle, aunt, and cousins, and her rather decided refusal to consummate the marriage under a year from that time. Her lover was a faithful escort to places of amusement, stood by her when she sang, and drove out with her often; but was not over demonstrative, and she liked him better for that. The fact of her betrothal was made public among the friends of the family, but that was not needed to bind either her or him to the promise made on Boston Bay. Her word once given was final, as if the solemn “Until death doth you part” had been spoken at the altar; while, had he expressed a wish to break the engagement, it would have seemed more natural and proper than the marriage, and, as ever since childhood, she would have expected John to have his own way.

That worthy individual seemed to have impressed himself by the words, uttered in jest, as to becoming a planter in the South, and, after various sportive renewals of the subject, a serious talk was one day had with his father, and then it was announced that he was, in truth, going to the land of sugar-cane and cotton.

Mr. Wilde, Sr., remarked at the breakfast table, after this announcement, “I shall give John ten thousand dollars to start with, Grace, so as to make him equal to you.”

She thought of what a pleasant surprise she would have for all of them, some day, but only said, “Thank you sir.”

In another week, there was a very lover-like parting from her, and John was gone. He wrote first from Savannah, on his way to the orange plantations on the St. John's River in Florida. Then he was in Alabama and in Mississippi. Then in Tennessee, and finally enamored with the grand scenery and fertile lands in that part of Georgia bordering on Tennessee. There he bought a finely-improved farm rather than plantation, for it was above the region of cotton, and in that of wheat and corn. He described it as a rural paradise, but sadly in need of repair and attention. He must stay there to see to these, and insisted that his mother, Grace, and Irene, should come down and regulate his bachelor establishment, if Fanny would keep house for his father until Christmas. The beautiful blonde, his sister Fan, was as pleased at the prospect of the reins of domestic government in her own hands, for a month or two, as the brilliant brunette Irene, and the other two, were with going, and the arrangement was made. With characteristic Yankee independence the three ladies expressed their baggage to Dalton, where the gentleman was to meet them, and took the cars with no escort.

After some little amusement from the frequent question, if they were coming South to teach the freedmen schools—to which Irene invariably answered, yes—they arrived in safety, and at once packed themselves and trunks into the four-horse spring wagon, which was to be their conveyance for the remaining twenty-five miles, and their church and pleasure carriage when there. A happier party never awoke the echoes of rock and mountain with silvery laughter, or bathed flushed and rosy faces in crystal roadside springs. Even quiet little “domestic Grace,” as her lover called her, wore out a pair of new shoes climbing the mossy rocks and exploring the vine-obstructed valleys, and looked as blooming as the country lasses.

Happy girlhood! its seasons are all hung full of the May-time, and autumn and winter bring no shadows for them, until the summer of life has withered the blossoms of their gladsome spring.

What if the grand old southern forests seemed anticipating the frosts not yet come? the changing hues of the leaves, and glowing splendor of the mosses, only gave color and variety to the garlands of hope they wove.

It was night when our quartette arrived at the Southern investment—i. e., John's new home—and the ladies were too tired to see more than a cottage in a large yard before they sought repose and slumber, after the supper of corn-bread, ham and eggs, with tea. But, the next morning, Grace and all the others fully endorsed the rather enthusiastic

tic account of his purchase given in the letters of the son, brother, and lover, in one.

A few days later, a piano, which John had ordered from Steinway's, came to the depot by express, and was soon contrasting its polished legs and soft cover with the pine tables and split-bottomed chairs and country-woven counterpanes of the former proprietor.

Carpentering, clearing up neglected land, repairing fences, house-keeping in the nearest approximation to Northern style, regulating the grown-up negroes John had hired, and keeping from stepping on the little negroes, who were omnipresent,—all this was soon the order of each day, and frost came before Grace and her lover had any leisure for courtship.

At length they took time, and the old mossy foot-log over the stream, which now had its bright waters died brown by the infusion of falling autumn leaves, was a favorite resort. The names of other lovers had been rudely carved on the great beech-tree which overshadowed the stream, and the spot was, in some measure, consecrated by the loves of those now turned to dust.

On one misty afternoon, when the tops of the mountains faded in a purple haze, and the atmosphere was soft and mild as Indian summer, the pair sat on this old log beneath the beech and above the stream; and the memory of the words then spoken was ever after more closely woven into the lives of each than even the declaration of love and promise of marriage union.

We mention this conversation, not because its language was remarkable, or the thoughts clothed in language were wonderful, but because it was all a new revelation of the character of the lovers to each other, and is therefore a new revelation of their characters to us.

John Wilde was an entire believer in the wildest theories, or, rather, no theories, of German infidelity, and devoted nearly an hour to the instruction of Grace and the effort to convert her to his views. Those views, so far as they related to God, salvation, and the immortality of the soul, might all be expressed in the words, *I know nothing; therefore, there is nothing*. An easy creed, making human ignorance the measure of infinitude.

Grace had listened with an amazement which he took for complete conviction, but she soon undeceived him by such a reply to his sophistry, and such an unravelling of his cobwebs, as speedily made him the astonished party of the twain. Even her gentle nature could not entirely restrain her from expressing the scorn which an educated Christian feels for those philosophers who erase the suns of the soul from space, and then write the word NOTHING, over the abyss of night, as both hope and creed. Some of her words were so true, and her inferences so sharp, as to make his face flush and his ears tingle.

It was his first mental combat with an intelligent woman, and he was foiled and beaten by the very weapons of reason to which he had appealed.

He looked divided between the inclination to strike her, like a ruffian, or break his engagement with her, like a gentleman; but he may have had his reasons for not doing either. So he contented himself with saying, sneeringly, "You had better get a pair of breeches and turn preacher!" and then arose from the log and moved toward the house.

The brook beneath his feet had babbled to him of a depth he had never suspected, in the nature of his little half-servant, Grace. She was pale under the power of that heart-question, "Great God, am I to marry a skeptic?" To us it seems that the father who gave fifteen lonely years for his daughter's happiness, may have labored in vain. He only knows who is "God over all—blessed forever."

It was the third week of the stay of the Philadelphians in Georgia, before they thought of seeking such church privileges as that rural district afforded. They learned that there was a neat little chapel, framed and painted, five miles away, under the pastoral care of a young minister who had charge of three churches as the *quid pro quo* of his salary of five hundred dollars a year.

In the few days following the long talk between the lovers beneath those lover-tablets on the bark of the beech-tree above the stream, John Wilde, or J. Wilde, Esq., as his cards now were marked, seemed a little uneasy. The old patronizing, self-complacent superiority with which he had permitted Grace Dawson to love him, had received a severe shock; and, as it evidently would not do to fall in his own estimation or hers, he adopted that usual male expedient—showing his authority. Few of the colored servants received more sharp and per-

emptory orders for a few days than did his affianced bride; but, as Grace obeyed in all things in the same meek and cheerful way that had been her custom from the time she could remember, it seemed unnecessary to hold a tight rein with so gentle and perfectly broken an animal, and that novel exhibition of spirit under his attack on her religion, lost the edge of its first offence. Thus it was, when, with his fast-trotting four-in-hand, the green-and-crimson panels of his spring-wagon flashing in the bright Sabbath sunlight, as the party whirled around the beautiful road above his fertile valley, "Richard," *alias* John, was "himself again," and he pointed out beauties to his mother, petted the spoiled brunette Irene, and patronized Grace, in the old way.

That Sabbath held in reserve for our heroine two surprises—one pleasant, the other not so much so. The neat little chapel, reached at last, seemed to nestle in the embrace of the oaken grove, and they soon found seats on the simple benches within. A young man, not devoid of natural gracefulness, and neatly dressed in black, arose to announce the old hymn, to which there would be no organ-accompaniment:

"There is a fountain filled with blood,  
Drawn from Emmanuel's veins;  
And sinners plunged beneath that flood,  
Lose all their guilty stains."

When the first tones of the clear, powerful voice filled the air above the large congregation, Grace started, and Mr. Wilde looked up in surprise. It was the young man who, since that commencement day in Cambridge, had been to her the embodiment of his theme—*eloquence*.

Soon the full, earnest tones of many voices compensated well for the absence of operatic singing, and, after the prayer, followed the sermon.

It was upon the strange theory that the love of God—which had filled the Sacred Book, and carpeted time, from the creation, through the epochs of deluge, patriarchs, prophets, priests, kings, psalmist, the example of Christ, and the testimony of the first martyrs, with words of love and examples of duty—was not yet satisfied; that when John, in Patmos, was about to close the long record of God's work for man, the patient Father stayed his hand, to spread upon the last page the memorable invitation beginning with, "The spirit and the bride say, Come!"

Upon this text the young minister proceeded to unfold those chief temptations which can win the soul to its own highest good—the perfections of Jesus Christ, which ever invite—the love of God, which fills the ages with its music, and ever whispers—come!

The sermon was not a long one, but Grace Dawson, who had from childhood been a member of the same branch of the church, dated her best and holiest religious experiences from that day. As for John Wilde, he said that "Vane would have made a capital fellow for criminal cases;" and Irene said it was all pretty, but rather too affecting for the pulpit—"We expect to cry, you know, at tender passages in theatres."

The second surprise of that day was when Grace left her friends talking with some acquaintances her cousins had formed in the nearest town, and went alone to the spring at the foot of the hill. Near it was a wagon whose occupants had brought their dinner with them, and one of them was filling the tin cups of the others at the bubbling fountain. She looked up and held out her hand with a cordial smile, and it was no other than Dora, the young German girl, discharged by her aunt for stealing, and so kindly provided for beyond the temptations of the city.

Grace did not return her greetings with as much warmth as they were given. If she had shown the confusion and shame natural at so suddenly meeting one who must know of her crime, all the kindness of the heart of our heroine would have arisen to reassure the criminal. But the frank, hearty gladness, and free, open manner, looked like brazen boldness, and Grace only asked a few questions—pleaded her waiting companions as an excuse for declining the acquaintance of the people in the wagon, and only said—"Do so," to the avowal of an intended early visit by the young Teuton. She did not speak of this second meeting, but it annoyed her, even when she met the young minister at the side of the vehicle of her party, and heard him promise his old college chum an early visit.

The promised visit was made, lasting two days, and was enjoyed by no one more than by the betrothed of the new planter. That it was

not without some interest to Irene, we gather from the following letter written by her to the sister left in the Northern home :

"HAPPY VALLEY, October 28, 1866.

"DEAR FAN: We have all been too busy here to be good correspondents, and have by a sort of common consent made cousin Grace our business scribe. Just fancy such a quiet, plain-faced little puss being our sister some day! No wonder brother John is in no hurry! This is a beautiful country, romantic, wild, sublime, and all that, and has only one or two drawbacks, the lack of dry-goods stores and young men. I do not know which I miss the most, but the latter deficiency is now in part atoned for. You remember that pale, interesting-looking youth (he would have been interesting if he had been blessed with a good sailor!) who so much enlisted his own sympathies (and ours) in a speech at Harvard, when John graduated. He is a preacher here, and makes a very passable beau. He dresses in better taste than he did, and looks like a model for men, in his mountain home. A little sunburn has much improved his once pale face, and I think the chickens, always sacrificed by these people when their priest (I beg pardon—pastor) comes, may possess more nutritive qualities than the omnipresent hash of boarding-houses. He has the thews and sinews of a Nimrod, and it is perfectly delightful to feel that leaning on him in a mountain ramble is like the support of a rooted oak; and one accustomed to horseback riding with city gallants can appreciate the strength of arm that lifts one to the saddle, without a seeming effort. Only one thing annoys me. We asked Grace to go, as a matter of form, thinking she would never dare to mount these wild horses; but she had learned to ride some way, while at school, and is the most fearless horsewoman I ever saw. Would you have believed it? But Miss Pale Face (blooming enough now though, I must confess!) is mortgaged, and never could be in my way if she was not.

"Now don't think I am such a ninny as to fall in love with this backwoods Apollo, but you may wager your diamonds that I shall lead him such a dance over these old hills, that his head will be too dizzy for his usual pulpit eloquence. He is to be here again next week, and I intend he shall abuse me as his *Clara Vere de Vere*, before I leave these parts. You know I mean Tennyson's—

'You held your course without remorse,  
To make him trust his modest worth,  
And, last, you fixed a vacant stare,  
And slew him with your noble birth.'

"That's my style! I only wish John was a little more lover-like to Grace—in company. He lets *anybody* entertain her, who will save him the trouble! Vane has to be encouraged up to our ideal, as he is too modest. Heigh-ho! mother wants me to attend to the poultry, and that is a greater bore than letter-writing. Love to papa. Good-by.

"Your sister,

"IRENE."

Richard Vane did come, and came often, for the cultivated mind of John Wilde was a treat to him, like a drink of refreshing water, after the rather insipid companionships of his mountain charge. He could lead his flock to the fold of Christ, and did; but few lambs of his fold could follow to those high pastures on the hills of God where he loved to climb. John liked him in a superior, patronizing way, and gave him good dinners and advice. Irene was only annoyed that he saw too readily how far she was above him, and turned to the more humble and less beautiful Grace, notwithstanding her engagement. So the brunette encouraged him.

On one pleasant day there was a drive, and Grace remained at the house to attend to the formal country supper. While busy, presiding over the mysteries of the kitchen, she heard a lighter step than that of the cook, and, turning, saw with little pleasure that she was alone to entertain the banished German handmaid. There was a forlorn attempt to sympathize with the much the other had to tell, when suddenly Dora stopped her own rapid account of the ills and blessings of life in the woods, and asked, "Do you know what I was sent away from Philadelphia for?"

Our heroine was tempted to say sharply, "For stealing"—but such a reply was evidently not expected, and she replied, evasively, "Uncle never talked much about it."

"Well, I never could understand it! I always did my work, until one day your aunt took it into her head that I was too young to be without friends in a big city, and nothing would do but I must be

bundled off with a lot of folks coming South. And I was threatened to be turned off with no recommendation for the next place, if I didn't come. They talked so good and sensible, I had to come, and I'm glad I did, but I don't know why till yet."

Grace looked shocked and frightened, but was silent.

"Don't look so uneasy, young miss, I always did like you the best, for you wasn't so high above servants as some, but I've had it on my mind to ask you something since I saw you at meetin', and I will ask it. What was there in a little black book, like a pocket-testament, that lay in the tray of your trunk, with a pencil in it?"

Grace was pale now, but said, "It was my memorandum-book, and in it my guardian had written the dates and place of record of some papers that are important to me, but to no one else."

"Would your aunt have cared to know about those papers?"

"Why ask me that?"

"Well, I am into it now, and may as well tell it all. I have often seen your aunt try your trunk (that one you brought from New York) with her keys, but the lock was queer, and no key would open it but yours. One day you went to ride with Mr. John, and, as he was hurrying you, you left your keys in the trunk. I was in the next room, and just caught sight of them through the open door, when your aunt came to your room and went straight to your trunk. I saw her open it, and open that little black book, and appear flurried, and heard her say something about a 'secret, deceitful huzzy,' and then I thought best to let her know where I was, and I coughed. She was up and had the trunk shut in a minute, and asked me if I was raised by her for a spy. I took out the keys when she went down, and you might remember my giving them to you. It was the next day that she took the strong notion for me to go away, and I have studied and studied, and can't think of any thing I ever did to be sent away for, if that was not it, and I never told you of that then!"

There was such a whirling in the poor head of Grace, that she never knew what words she spoke to satisfy the German, or change the subject. There was clearly no theft of silver, and she was more than relieved when Dora refused to stay, and left the house before the return of the aunt and cousins, and the clergyman.

She went to her own room, and undressed for bed; and the headache reported by the mulatto chambermaid to the others, was real enough, for the fierce throb in the temples long defied her efforts to be calm and pray. She did remember the ride and the keys, for the deeds were there, and a prying chambermaid might have found her secret and her father's. That remembered day was followed by the caresses of the aunt and the plea for confidence, more than once repeated. Then the trip to Boston, the sail on the bay, and the sudden avowal of life-long love, the growing kindness of all the family, and the sanctioned engagement, with the lover's wish for speedy marriage.

It was all plain enough now. The memoranda told enough to link with the private talks and mysterious manner of Mr. Mann, and show her an heiress beyond all doubt, save what a visit to the New York records could remove; and John had been there, and Jonathan before him—at least, to the city at that time. Daylight came to red eyes and sick heart, uncomfited by slumber, and the little form would still be convulsed by a shudder at the thought—"My husband an infidel and a speculator on love—so strange and unnatural in all his manifestations of affection!"—and then the prayer of agony—"O God! save me!"

When she went down to dinner, her flow of spirits was more than natural, and Irene was seriously annoyed that her betrothed cousin avoided her brother, and was in the way of the flirtation with our young parson.

The visit of Richard Vane was this time to last a week, and every day there was a riding-party up some of the mountain-roads.

The main turnpike or toll-road passed over a spur of the mountain, and then wound down, in the same zigzag as the ascent, to a deep gorge, down which foamed in greater volume the same stream which flowed down the valley toward the mouth of the cañon. Here the road found the gorge wide enough for a shelf-like bank on one side or the other, and ran for some miles between the mountains, on this side or on that, as the capricious stream varied its course. The steep mountains narrowed the heavens to a blue belt above, and, beneath the great gray rocks and towering chestnuts, it was the delight of our friends to ride—dashing through the rapid fords of the stream, and eating the luncheon by some fairy spring, cold as the heart of

the granite. On the last day but one that Mr. Vane was to stay, a little picnic was planned, to be enjoyed at the farthest of the fords and five miles from any house. The minister and Grace won the honors of equestrianism, galloping along precipitous ledges where the queenly Irene trembled for her life, and John Wilde for his horses. It was a still day, very warm for the season, and the negro predictions of a storm were laughed at. But in the midst of the enjoyment, as John in the wildest of spirits drank a toast to Nature, that dread power responded by the first mutterings of her storms. Beneath the almost perpendicular mountain, and the thick trees, the mustering of the black cloud-squadrons had been unnoticed, and the first warning was a dash of rain that suggested seeking for a cave, to the two gentlemen, and wishing for wrappings and umbrellas to the ladies. An over-leaning rock was found, with marks of wagoners' camp-fires to show its previous tenantry, and it proved an admirable, dry, and safe shelter from which to view that grandest of sights, a storm in the mountains. We shall not describe it, nor will he who has heard that thunder-drum of heaven beating time to the echoes of the eternal hills, or watched the spray of cascades created from every cliff or rocky barrier, or who has cowered as the lightning struck the giant pine on the crest, and filled the gorge with the rain of fiery splinters, ever attempt to paint in words what the hills and the heavens labor to produce.

The storm, commencing at noon, was not over until near night, and then the frequent fords of the stream, swollen to swimming depth in places, were exceedingly perilous. But Richard Vane knew the ground and led the way, and the spirits of all parties arose as all of the fords were passed save the last one, which was very swift and narrow, but not deep. It was reached at dusk, and they saw with terror that a raft or dam of driftwood and logs had formed in the only passable part, and the imprisoned water was dashing over this and raging through the dark ravine below.

John Wilde was flushed with the wine he had been almost the only one to drink, and at once proposed to urge the horses down the bank, and through the sharp rocks of the water-filled ravine. Mr. Vane looked and said, "It would be almost certain death to attempt it."

"But I am not going to stay in the woods all night, like an owl," said the other, "and I will attempt it."

"But the ladies could not go!"

"I will find a ford for them easy enough."

"If you insist, stay with them and let me try it, as I am accustomed to these places."

"Just like you, to take an easy glory when you know I would not give way!"

All remonstrance by his friend, or entreaty by his sister and cousin, was of no avail, and as he urged his tired but fiery animal down the steep bank, the young minister threw off his coat, and sprang down to the brink after him. With a splash, horse and rider were in the water and half-way across, when the forefeet of the quadruped slipped from a hidden rock near the surface, and, as he fell over on his side, the head of the rash rider struck another sharp ledge with a dull thud, heard above the roar of the torrent; and, instantly washed from his seat, he was swept away.

Quickly as this was done, the watching man on the bank had plunged in after him, while Irene shrieked, and Grace prayed.

For a while nothing more could be seen in the gathering gloom but the horse escaping, evidently injured, and limping up the other bank. Soon, however, a faint voice called far below, and Grace was the one to clamber down the rocks, and find Richard Vane dripping on the bank, and supporting the motionless form of his friend. One look at that great gap in his head was enough even in that dim light, and the finger on heart or pulse felt no throb. He was dead.

They two had to bear the body up to the road, for Irene had fainted where she was left.

It was midnight before Richard had cut a path with his knife through the thick brush of the mountain above, and nearly day before the horses were led over it, and the dead man carried by the strong mountaineer, and Irene led along its slippery margin by the steady hand of Grace.

Then the living man carried the dead before him on his horse, while those of the two women were followed by the lame animal.

As they at last descended the mountain-spur, and crossed the same stream, already much lessened in volume by the brief time, the white, scared look came to her face again, as Grace thought of who had

sat upon that old log beside her, and questioned the existence of a God. The thought would come to her,—Had he recognized Him and His providence now?

He at least had solved the mystery, if not the purpose and origin of death. What of the beyond?

The young Vane, with his left arm in a sling, from a sprain received that night, was gone to his flock and his three churches.

The dead man had sent to his Northern home for burial. The father, Jonathan Wilde, came to rent out the farm, and the three saddened women shadowed their Philadelphia home with black robes.

Irene had not made a captive of Mr. Vane, and Dora was seen no more.

Christmas was dull enough that year, with the hope and pride of the household gone, and the aunt seemed to look upon Grace with some such aversion as if she was the cause of his death. Jonathan Wilde had frequent talks with her, and seemed to delight in pointing out to her openings for the investment of capital, to which the ten thousand still in the hands of Mr. Mann would have been utterly inadequate.

In February of 1867 she read a notice that Rev. Richard Vane, of Georgia, had received a transfer to a metropolitan church near the famed Avenue of New York, and, as the churches North and South were still separated, the paper was particular to state that influential men who had known him at the university were the parties who had brought it about with some difficulty.

His salary was ample now, and he came to see her, and told of the beautiful brown-stone church, and the grand organ and sweet-voiced choir. When Mr. Mann came to see her, she returned to New York with him, and sat under the ministry of the backwoods preacher, who went with her the next day to visit her father's grave.

Among the early violets at the foot of the slab, he told his love, and found, when she leaned on his breast and told him all (all but the secret), that he had won a heart no other ever possessed.

We can know very little of the emotions of the dead, nor do we certainly know if they are concerned for the dear ones left behind. Yet—

" 'Tis a beautiful belief, that spirits of the dead

Come in the lonely hours of night to watch around our bed,"

and it is not unlikely that the father of Grace led her mother to some rift in the blue pavement of heaven, and said, "Our child has more than wealth—the riches of love!"

Before the June roses of 1867 had poured their sweets into the lap of summer, they were married from her Philadelphia home; and it was Uncle Jonathan Wilde who put the title-deeds to one hundred and fifty thousand dollars of New York property into the hands of the astonished bridegroom, and said, "I have given you an heiress, sir!"

Mr. Mann was not so pompous when he accounted for the rents and the ten thousand. He only said, as he refused all compensation, "I am richer than you are, sir, and she was the child of my friend."

Grace says that she is kept from becoming vain of becoming Vane, by her husband, who insists upon changing her old name of Grace Dawson for that of the English heroine—*Grace Darling*. He generally gets it wrong, however, and calls her his Darling Grace.

The minister now owns the "Happy Valley," and, with his little wife, who is really blooming into beauty under the sun of love, will spend his summer vacations with his parents, who live there.

Our story, reader, has been of Love and Death, the twin rivals for the empire of life. But no one can tell so sweetly as Tennyson how love always wins:

"What time the mighty moon was gathering light,

Love paced the thymy plots of Paradise,

And all about him rolled his lustrous eyes;

When, turning round a cassia, full in view,

Death, walking all alone beneath a yew,

And talking to himself, first met his sight.

'You must begone,' said Death, 'these walks are mine.'

Love wept and spread his sheeny vans for flight;

Yet ere he parted said, 'This hour is thine;

Thou art the shadow of life, and as the tree

Stands in the sun and shadows all beneath,

So, in the light of great eternity,

Life eminent, creates the shade of death:

The shadow passeth when the tree shall fall,

But I shall reign forever, over all."

## NO HOPE.

THEY rode together along the sand,  
 Yellow and flat, and with never a spray  
 Of flowery sweetness either hand,  
 And into the woodland, and out of the day;  
 But sunset, or sunrise, what cared they?

For never was silence captive took  
 By trembles, tender as thrilled the leaves,  
 When the moon, with her body bent to a crook  
 Like a harvester when he binds his sheaves,  
 Bound the day to the best of eyes.

And time was never such time of grace,  
 As when, from his saffron and silver bed,  
 One star that was got of the soft embrace  
 Of the light and the darkness showed his head—  
 You will guess by the picture what they said.

Ah, could you not have given one glance,  
 Fair lady and fond, for his gentle sake,  
 Whose life was narrowed up to a chance—  
 The single chance that but you could make?  
 Poor heart, dear heart, so young to break!

ALICE CARY.

## THE POWER OF THE MIND TO RESIST KNOWLEDGE.

IGNORANCE is a very favorite topic; we charge ourselves, our friends, our enemies with it, as a ready and stereotyped accusation; but it may be doubted whether it is attributed as often as it ought to be to the mind's active energies. Not only should all of us know more if we learned more—if we applied our minds more sedulously, if we conquered our indolence, if we roused our dormant powers—but we should know indefinitely more if we did not treat knowledge as an enemy, if we did not sedulously resist its inroads. The power of the human mind to resist knowledge is not duly considered in treating the subject. We are so used to the result, that we do not sufficiently note the cause. As regards a good deal of the ignorance that is in and about us, the difficulty is to discover how men contrive not to know; and we observe that a very resolute will must have been at work. We do not see that any effort whatever would have been needed to take in certain ideas. An ordinarily intelligent mind that was not preoccupied could not help receiving them—as, for instance, the forms and qualities of objects continually before our eyes, or simple facts stated within our hearing; rather, the effort must have been applied to shut them out, to prevent thought and reason exercising themselves upon them. We often fail to do justice to our own cleverness. In fact, men and women can always learn what they honestly want to know—what they want to know in preference to other indulgences.

All people receive willingly congenial knowledge; what they reject is either that which finds no place for its reception, or that which is unwelcome at the time from the mind's being otherwise occupied, whether by another train of thought or in the agreeable pursuit of fancy. We do not, of course, mean imagination at work in any laborious sense, but a devious, aimless self-abandonment to every suggestion that comes uppermost. Minds given to reverie are not passively, but actively, averse to knowledge; any thing that interferes with the promptings of the moment, that arrests thought, that lays some force upon inclination, is repulsed instinctively as an enemy. It is astonishing how this enmity to ideas grows with indulgence, till it is next to impossible to find a place for facts, opinions, thoughts, or speculation in any sense that demands the faintest effort—in a word, for whatever threatens to arrest the trumpery procession of vague images. In such a state of the faculties nothing interests a man that has not some personal relation; nothing can be received that is new or so far abstract that it cannot be turned on the spot into a question of self. Of course, an all-absorbing pursuit may possess the mind like reverie. No one can do great things in science or art without his mind being occupied to the forcible exclusion of uncongenial knowledge. But laziness and folly have more abstractions than thought and genius, and hug their lucubrations with a more resolute clutch. The man who is pleasantly engaged on the oft-conned problem of how to keep a horse, or when and where he is to make his first speech, or otherwise show himself a fine fellow, or in planning schemes of amusement, or reckoning up his expenses and means of defraying them, or his chances of an inheritance, is quite as steadily opposed to a bit of information that has no relation to any of these questions as if it sought to thrust itself into the midst of profounder speculations.

It is easy to perceive that to some young people the whole world of thought is a blank, that it excites in them feelings of positive repulsion and abhorrence; and, if this be so in youth, there is little chance that mere growth in years will bring about any change that shall effect a reconciliation. If men are to think to any purpose, they must learn to think when young. But, we repeat, it is not native power that is wanting. Take the girl whose head is full of dress, and who is always contriving how to set herself off to what she thinks the best advantage. So long as this taste is ministered to, her attention is alive, her apprehension is quick, her fancy suggestive. She is clever, receptive, laborious. She can take in the most complex description, she can picture to herself the most elaborate effects. She is imbibing new ideas every moment; she is apt, open, liberal, industrious; she is in the state to learn a science or a language, chronology or chemistry. What she is doing is only less difficult than graver studies because it is more congenial. To detect real from false, to appraise a fabric to a nicety, to take in at a glance a thousand details, are feats of the intellect not less remarkable in their nature than those

of the naturalist who knows the note and flight of birds, and the habits of insects. Set him upon the young girl's pursuits which are her pastime, and he will be as unteachable and reluctant as she will probably show herself toward his studies; and for the same reason—unteachable because reluctant. It is the wish to know, not the power to learn, which is the desideratum.

There can be no more irksome task to many minds than to address themselves to subjects which require from them some accuracy of information. This is one of the reasons why questions are often so intolerable. They awaken people to the fact that they know nothing; which matters little so long as they themselves are the only losers, for if they know nothing it is because they preferred to know nothing; but it is a bore to be expected to know, and exposure is always a nuisance. Many persons who travel guard themselves jealously against the acquisition of new ideas; they are so tiring; they seem to stretch the mind hither and thither out of all its bearings. "Oh for a shop-window!" they seem to cry, in the midst of museums and galleries, "for something familiar, some link between myself and what I see." Everybody knows this feeling more or less; it is a revolt against new knowledge, a taking refuge in our weaker selves, which is perfectly justifiable in its degree. Certainly inquiring minds are apt to be bores; people that will pursue and get to the bottom of subjects are great disturbers of the peace, unless this curiosity on their part is qualified by more sympathy than commonly belongs to it. It is well to tell children, "Never submit to be ignorant when you have knowledge at your elbow;" but it is an axiom which requires modification in general society, where, as we have said, few persons are ignorant in an exceptional degree unless because they like it. These probers ought to know that most people like to think as little as they are compelled to think; that to fix or nail the mind on a subject is utterly alien to many an intelligence which is bright and active enough in its own groove; and they should be tender in obtruding their useful, instructive, and important topics upon reluctant yet ashamed ears. As zealous, restless inquirers after truth, they may, with Locke, consider it a fair question how far these enemies of learning are, in knowledge and intellectual faculties, superior to a cockle or an oyster; but they should spare the feelings of their weaker fellow-creatures. The reception which we are all too prone to give to knowledge thrust upon us is that which a party of gossips might give to the invasion of a charitable or literary deputation. The people may be worthy folks in their way, their talk full of information or of utility to their neighbors; but what an interruption! and how willingly do the invaded see them depart, that they may relapse and unbend on the instant into the familiar trivialities!

It is a sufficient reason to a great many people not to acquire new ideas, that they are new. "I know nothing about that" means, "I am steadfastly resolved never to know any thing about it." Even where their interests are involved, the strangeness and horror of novelty carry the day. A mother, for example, has a son at school or college, yet the whole phraseology of school and college life remains to the end mere Greek to her. Little-go, moderations, class lists, and what not, her mind is a chaos to them all; and because women do not play cricket, just as they do not yet go to college, the rules and machinery of that game are in like manner unattainable by the female mind. As an instance of feminine power to resist knowledge, we were struck the other day by a description of a High-Church parson in *Good Words*, betraying an ignorance which we must regard as the more signal and remarkable considering the amount of dignified clerical teaching brought to bear on that favored periodical. The lady draws the portrait of the Rev. Tobias Choake, who fasted on Fridays and *Saints' days*, advocated auricular confession, and was suspected of wearing a hair-shirt. This lady has lived through Oxford, Anglican, and Ritualistic movements to no better purpose than actually to suppose that the leaders of these parties regard *Saints' days* not as *feasts* but *fasts*—a case of scarcely less singular deadness to importunate knowledge in one line than was that quoted by Southey of the Liverpool merchant in another, who wrote to his bookseller for Milton's, Shakespeare's and Dryden's works, and if any of those fellows wrote any thing new, he was to send it as it came out. In both cases alike it is impossible that the truth should not have often enough sued for admission at eye and ear, only it was let slip at the time as being without interest to the non-recipient.

Many persons have the faculty of refusing and rejecting all knowledge that goes against their prejudices or inclinations. It is perfectly

useless to enlighten them; they prefer a fog, and have a chemical faculty which reproduces it after every attempt to clear it away. Thus Dr. Manning has asserted that the Church of England cannot be what she claims to be, because there is so much infidelity among the English laity—an argument that requires him to ignore the fact of infidelity in France, Spain, and Italy. The policy of non-admissions generally which belongs to his school is based upon this chosen and wilful ignorance. We may perceive indeed how very valuable this power of rejecting knowledge must be to all who have a strong line to take, and a theory to inculcate. Lacordaire, advocating the restoration of the monastic orders, quotes a saying of Napoleon that he did not fear the Spaniards because "It is a nation fashioned by monks; and all monks are cowards." "And at the foot of the Pyrenees," cries the preacher, "he found Christians formed by monks; and his warriors, who used to say that from the Pyrenees to the Baltic they had met nothing but children, confessed, in language both military and energetic, that they were more than men, that it was a war of giants. Spain had the signal honor of being the primary cause of that man's ruin." It suited the orator not to know that, in so far as Spain caused Napoleon's ruin, it was by bringing him in contact with a nation *not* formed by monks; and Lacordaire was no doubt able really to exclude this fact from his consciousness. And even where no principle is involved, that inobservance which is the reproach of commonplace ordinary sinners is the glory of some saints, of one of whom we are told that, after living in his cell some forty years, he was found in entire ignorance of its form, color, and furnishing.

There are, we suspect, in all minds desert places not capable of cultivation, where knowledge, fact, and inference will not grow. Certainly, in spite of all we have said, there is a respect felt for persons possessing any accurate knowledge which would be disproportioned but for this admission. But, allowing this, the marvel remains that so much of what it would seem easier to receive than to reject remains unknown. Perhaps a good time is coming when accuracy—without which knowledge does not deserve the name—will be a more common virtue than it is now. In the meanwhile it must be confessed that our preference for the society of one fellow-creature over another is not ruled by this scale, and that we have passed some of our liveliest hours with persons whom we would no more subject to any critical examination whatever—even on those subjects which are so familiar and within reach that it would seem an effort of ingenuity to be ignorant of them—than we would covet such an investigation for ourselves.

### BEE-HUNTERS OF TIMOR.

THE bees' wax is an important and valuable product, formed by the wild bees (*Apis dorsata*), which build huge honeycombs, suspended in the open air from the under side of the lofty branches of the highest trees. These are of a semicircular form, and often three or four feet in diameter. I once saw the natives take a bees' nest, and a very interesting sight it was. In the valley where I used to collect insects, I one day saw three or four Timorese men and boys under a high tree, and, looking up, saw on a very lofty horizontal branch three large bees' combs. The tree was straight and smooth-barked, and without a branch, till at seventy or eighty feet from the ground it gave out the limb which the bees had chosen for their home. As the men were evidently looking after the bees, I waited to watch their operations. One of them first produced a long piece of wood, apparently the stem of a small tree or creeper, which he had brought with him, and began splitting it through in several directions, which showed that it was very tough and stringy. He then wrapped it in palm-leaves, which were secured by twisting a slender creeper round them. He then fastened his cloth tightly round his loins, and producing another cloth wrapped it round his head, neck, and body, and tied it firmly round his neck, leaving his face, arms, and legs completely bare. Slung to his girdle he carried a long thin coil of cord; and while he had been making these preparations one of his companions had cut a strong creeper or bush-rope, eight or ten yards long, to one end of which the wood-torch was fastened, and lighted at the bottom, emitting a steady stream of smoke. Just above the torch a chopping-knife was fastened by a short cord.

The bee-hunter now took hold of the bush-rope just above the torch, and passed the other end round the trunk of the tree, holding

one end in each hand. Jerking it up the tree a little above his head, he set his foot against the trunk, and, leaning back, began walking up it. It was wonderful to see the skill with which he took advantage of the slightest irregularities of the bark or obliquity of the stem to aid his ascent, jerking the stiff creeper a few feet higher when he had found a firm hold for his bare foot. It almost made me giddy to look at him as he rapidly got up—thirty, forty, fifty feet above the ground; and I kept wondering how he could possibly mount the next few feet of straight smooth trunk. Still, however, he kept on with as much coolness and apparent certainty as if he were going up a ladder, till he got within ten or fifteen feet of the bees. Then he stopped a moment, and took care to swing the torch (which hung just at his feet) a little toward these dangerous insects, so as to send up the stream of smoke between him and them. Still going on, in a minute more he brought himself under the limb, and, in a manner quite unintelligible to me, seeing that both hands were occupied in supporting himself by the creeper, managed to get upon it.

By this time the bees began to be alarmed, and formed a dense buzzing swarm just over him, but he brought the torch up closer to him, and coolly brushed away those that settled on his arms or legs. Then, stretching himself along the limb, he crept toward the nearest comb, and swung the torch just under it. The moment the smoke touched it, its color changed in a most curious manner from black to white, the myriads of bees that had covered it flying off and forming a dense cloud above and around. The man then lay at full length along the limb, and brushed off the remaining bees with his hand, and then, drawing his knife, cut off the comb at one slice close to the tree, and, attaching the thin cord to it, let it down to his companions below. He was all this time enveloped in a crowd of angry bees, and how he bore their stings so coolly, and went on with his work at that giddy height so deliberately, was more than I could understand. The bees were evidently not stupified by the smoke or driven away far by it, and it was impossible that the small stream from the torch could protect his whole body when at work. There were three other combs on the same tree, and all were successively taken, and furnished the whole party with a luscious feast of honey and young bees, as well as a valuable lot of wax.

After two of the combs had been let down, the bees became rather numerous below, flying about widely and stinging viciously. Several got about me, and I was soon stung, and had to run away, beating them off with my net and capturing them for specimens. Several of them followed me for at least half a mile, getting into my hair and persecuting me most pertinaciously, so that I was more astonished than ever at the immunity of the natives. I am inclined to think that slow and deliberate motion, and no attempt at escape, are perhaps the best safeguards. A bee settling on a passive native probably behaves as it would on a tree or other inanimate substance, which it does not attempt to sting. Still they must often suffer, but they are used to the pain, and learn to bear it impassively, as without doing so no man could be a bee-hunter.

### FRENCH MORALS AND MANNERS.\*

BY A ROVING AMERICAN.

"WHY, sir," says General Andrew Jackson Jenkins, of the New-York militia, standing in the court-yard of the Grand Hôtel, and ejecting at the same time a quid from his left cheek, "these Frenchmen don't know what home means. They haven't got any, poor devils! They live on the boulevards, eat at the restaurants, and sleep in the garrets of their own houses, hiring the best apartments to Russians or Americans, who can afford to keep them. I'll tell you what—Paris is a fine-looking town; but it is like a shirt that's all frill."

"Aw, yes," languidly responds the Hon. Arthur Snobly, Attaché to H. B. M. Legation; "vewy cowwect. These poor beggars haven't even *the word* in their language. Madame tells you she is *chez elle*, when she invites you to call; and Monsieur gives you a *petit souper* at Vefour's. Never had my legs under a Frenchman's mahogany. Look at Jules and Anatole there,

\* "M. de Camors," par Octave Feuillet. "La Comtesse de Chalis," par Ernest Feydeau. "Les Grandes Dames," par Arsène Houssaye.

flanking down the boulevard; after displaying themselves, they will sup on a cigarette, and sleep on the curb-stone. As to the women—"and the young Attaché pulls out his long whiskers, looks unutterable things, and relapses into silence.

Such is a fair average of the opinions entertained by roving Americans and Englishmen, as to the manners and morals of France at this epoch. Let us inquire if the estimate be a just one.

Although we boast of our independence of English opinions and English prejudices, yet in many material points we are servile copyists of the people, from whom we have drawn much of our blood, as well as our language and laws. Among other good old British prejudices, we have inherited their traditional estimate of the French people and of French society, and are as obstinately wedded to it, as though we were bound to look through John Bull's colored glasses, instead of using our own eyesight—sharp enough on all other occasions. Even the wit of Sydney Smith failed to disabuse the English mind of its deep-rooted prejudices against the Gaul, whom sturdy John Bull could not be brought to believe "a man and a brother," but a being only a few degrees removed from a monkey—a mixture, as Voltaire scoffingly defined him, "of tiger and ape." He also believes the Frenchman to be entirely devoid of natural instincts; and those domestic virtues which alone can make woman the true helpmeet of man. In fact, the popular belief in England, which has been adopted in America, ever has been, that there is *no home*, properly speaking, in France; and that their social life is rotten to the core, marriage being with them only the convenient cloak for license, and every Frenchman and woman disregarding the divine and human precepts which make it a solemn and binding sacrament.

A long residence among that people, and an intimate acquaintance with the social life of France for several years past, have convinced the writer of the injustice and the falsity of this opinion; for it may be broadly stated, that neither in England nor in America is the marriage-vow kept more inviolate, nor, in many respects, would the contrast of the relative social systems be unflattering to France, were it fairly and properly instituted.

It may be said, that, as all good Americans "expect to go to Paris when they die," and as annual shoals of our countrymen pour into that bewitching city to take a bird's-eye view of their future paradise, our people have the opportunity of judging for themselves the state of society there, independently of all foreign opinion. But of the American visitors to Paris who fill the Grand Hôtel and the Hôtel du Louvre, and, guide-book in hand, take the public buildings and galleries by storm, crowd the theatres, and become familiar apparitions in the Bois de Boulogne, and even figure at the Tuileries balls, to which only five thousand invitations are issued, how many of them ever get even a glimpse of French society, or gain admission into a solitary French family on a familiar footing?

A man or woman may live in Paris for many years, and, unless peculiarly fortunate, or favored by extraneous circumstances, never get the *entrée* to the jealously-guarded French home, which is not open to all comers like an American, but is an inner shrine, most carefully guarded against intrusion. Hence, as the Prophet in his haste said, "All men are liars," so the roving American as rashly decides there is no social home-life in France, because he has never seen it, nor met those who have had the privilege denied to him. Finding his letters of introduction, which in England and America are always considered as "tickets for soup," giving admission to the family circle, do not answer the same purpose in France, and, meeting the person to whom they are addressed only at the opera, the restaurant, and the public promenades, the conclusion is arrived at that the domestic hearth is ever cold, the table never spread at home for the entertainment of friends, and that the modern Frenchman, like the old Greek, regards his house only

as a shelter, a place to sleep in, his enjoyment being all taken out of doors.

Without pausing, at this moment, to present the other side of the picture, and to sketch the inner life of the French family, as the writer has seen and known it, let us endeavor to trace some of the reasons for this belief, independently of the Anglo-Saxon prejudice we have taken at second hand.

Much of the responsibility of this false judgment taken by foreigners of French society must be visited on their own writers of fiction, who, in their eager desire to produce strong effects, have caricatured and defamed their own countrymen far worse than writers alien to them in land and language, thus strengthening the prejudices already existing, and aiding to confirm them. The spasmodic school of literature, which spawns its Braddons and its Ouidas, and smaller fry in shoals, in England and America, has its "tritons among the minnows" in France, and three of the most able and popular of these in their latest *chef-d'œuvres* give a most exaggerated and distorted idea of social life under the New Empire, which they all profess to paint from actual observation; for each and all of these writers give us only the morbid anatomy of the social body, never presenting us (except in one episode in the first named) even a glimpse of the healthy exercise of its functions.

It is as though the Anatomist should lead a child through the loathsome wards of a hospital, and, pointing out all the ills which flesh is heir to, and showing no healthy body, should tell him, "Such is life!" These moral Anatomists, confining their demonstrations to the unwholesome atmosphere of the most corrupt (if it be socially one of the highest spheres) of Parisian life, and revelling in the recital of its levities and crimes, its sins against God and human nature and all social laws, its license without limits save its own caprice, induce the outside world to believe that these fetid fungi alone, and no better fruit, are forced in the hot-beds of Parisian civilization. The French people themselves, whose thirst for strong sensations can only be slaked at such impure fountains, are partly to blame for this; for decidedly the most popular authors in France to-day are Octave Feuillet, Ernest Feydeau, and Arsène Houssaye, and within the last few months there seems to have been a kind of devil's race between the three, to see which could dip his brush in darker colors, and blacken most the fair fame of his countrymen and countrywomen. The trial commenced with the "Camors" of Feuillet, who had before that work gained his reputation as a writer of pastoral stories, in which the purity of the thought and of the characters was equal to that of the style. The critics "damned him with faint praise," as being a very pleasant and pretty writer, but lacking force—a painter of butterflies, in fact. This nettled the sensitive French nature of Feuillet, who felt within him the force and fire of the genius he undoubtedly possesses. To disprove the accusation, so galling to his vanity, that he could not descend into the depths or soar to the heights of human passion, he penned "Camors," a terrible libel on the man of the New Empire, and at the same time on French society; and the greater the truth, the greater the libel, even if his portraiture be true, of the small circle which buzzes and swarms around the throne, and its hallowed precincts. The surprise created by this feat was only equalled by the sensation it produced, and all Paris was enraptured by this tragedy—grim and terrible as any of Victor Hugo's—wrought by the hand which had before only woven garlands of flowers. One of the ablest of French critics, Emile Montagu, gave expression to this sentiment, in a critique upon the book in the *Revue des Deux Mondes*, in which he says:

"Quitting his doves, Octave Feuillet seeks diversion among the lions and tigers of the human soul, and comes off an easy conqueror from the terrible sport, without tension of sinews or straining of muscles, and without any barbaric shouts."

Yet is the tendency of this book not wholly evil, for remorse and retribution dog the footsteps, and finally hunt down to death through slow agonies, the splendid sinner whose

worldly success was so complete; and the story points the moral, that success in life alone will not command happiness, and that honor, without faith, is a broken reed to lean on, in the hour of strong temptation.

But the connection in which this work is referred to here, is in regard to the pictures it presents of French life, which he paints as entirely devoid of those small sweet daily blessings of unreserved affection and intimate intercourse which can alone endear man to his home.

The marriage-tie, in his eyes, is simply a form, a matter of convenience; if not openly disregarded, secretly broken, without scruple or shame—grinning dishonor seated on the hearthstone, and domestic treachery plotting by the fireside. Love is considered incompatible with legitimate affection by the perverted hearts of high-born lords and ladies; and, like the famous Duchesse of the old *régime*, the new ones all "sigh for sin even in a cooling draught," to "give it a relish." This is neither French nature nor Nature at all. Her works are all good and pure originally, even as Adam came from the hand of his Creator, and in France, as elsewhere, the soil and stain of sin is exceptional. Were it otherwise, they would be a race of monsters, not of men. As though to contrast the lurid splendor of the life of the great city, with its atmosphere stifling almost every virtuous impulse, with the calmer regions of rustic innocence, he transports his reader into the peaceful homes and pure air of the country, but only long enough to make the moral malaria of the former more poisonous to the senses, when he bears him back again into it, disgusted, yet fascinated in his own despite. The model man of the Empire, M. de "Camors" (in whom, it is supposed, the Duc de Morny is shadowed forth) is a moral monster; and yet, as Feuillet says, "a man nevertheless." But a man wholly exceptional, the type of a very small class, the hot-house fruit of a court, not an indigenous product—a creature such as was found in the profligate court of the *Grand Monarque*, or among the equally profligate courtiers of England's "Merry Monarch," knowing no law but his appetites, no soul but his senses. The vices and the demoralization engendered by a corrupt court are totally different from those bred in a democracy, though even the latter has had its Cleons in olden time, and created even meaner, baser, and dirtier things than Cleon nearer our own day, whom it might be injudicious to particularize.

Irritated by the intrusion of this piping shepherd from Arcadia upon their own domain, the rivals on that field sharpened their pens, and prepared for a new onslaught; and Ernest Feydeau first entered the field with "La Comtesse de Chalis," intended to depict the "woman of the Empire," as "Camors" represents the man. Of this book it is only necessary to say that Feydeau paints the woman of the Empire after the model of the vilest of those vile things—the modern Jezebels of Paris—and that the "Dame aux Camélias," apotheosized by the younger Dumas, is a lily of purity, contrasted with the high-born and high-bred lady he selects as the type of her class, whose morals are those of *Mabille*, and whose manners would not even pass muster at the *Château des Fleurs*. In this book the grossness of the thoughts is thinly veiled by the transparent elegance of the diction; yet there is no improper word, nor any coarse indecency in the descriptions. But the whole thing is intrinsically low and vile in conception and execution, without even the gloss of a moral to redeem it: without even the reprehension of actions and sentiments on the part of all the characters introduced, which are libellous, not only on womanhood, but on human nature as well. There is no redeeming character in "La Comtesse de Chalis," and, if she were the true type of French womanhood, then woe to France! woe to womanhood! and worse, woe to the men who spring from mothers such as she! This effort of Feydeau, to paint the woman of the Empire as a pendant to "Camors," did not have a similar success with the original. Strong as the French stomach may be, and tolerant as their canons of literary license are, "La Comtesse de Chalis"

was found "un peu trop fort," and, as Milton says of his devils, on tasting the Dead-sea fruit, was

"With sputtering noise rejected"

by the Parisian public. By no means discouraged by this want of success on the part of his fellow-knight in the cause of illegitimate romance, the veteran Arsène Houssaye sprang into the lists; and the last and strongest sensation of the day, in such circles as gloat over and greedily feast on garbage, is undoubtedly his "Grandes Dames de Paris," in which he professes to paint not only one, but many types, both of the man and the woman of the New Empire; and the men and women thus drawn, if not creatures of the prurient imagination of the artist, evidently not created in the image of God, but of the devil! The works of Feuillet and of Feydeau, professing each to give a single portrait, were sketched on a single canvas—one short volume. The more ambitious Houssaye stretches his gallery over the ample space of four bulky volumes, with colored portraits of his heroines in the worst style of French art, illustrating his printed impurities. Of this book it is sufficient to say that "Don Juan" is biblical in comparison, and the adventures of the "Chevalier Faublas" a moral treatise! The cynicism, the brutality with which indecencies are paraded and animality made the leading impulse of both his court lords and ladies, entitle Arsène Houssaye to the title of the Caliban of French literature. How any man could calmly sit down, and not only pen but print such a farrago of indecencies, unredeemed by wit, humor, or likeness to real life anywhere, is a marvel only equalled by the fact, that such writing should be read and should be popular. This may be partly accounted for by the supposition that, as "Camors" was believed to be the portrait of a distinguished man, and the "Comtesse de Chalis" the outline of a notorious lady at the French court, so Arsène Houssaye's male and female characters were supposed to be kindred libels; hence the curiosity to see how he fluttered the feathers of a bevy of birds all at once. Besides this motive, there may be another. There is a large class in France which hates the court and every one connected with it, including the fashionable society, and its members will gloat over such pictures of the morals and manners of the aristocracy, just as our "Bowery boys" will spell out, with eager interest, those denunciations of the vicious banker in fine linen, by the virtuous apprentice in his shirt-sleeves, protecting female virtue from outrage, in the current stories of our popular *Weeklies*! There is an old proverb about the "birds which foul their own nest," and two out of three of the romancers we have named have wilfully and deliberately done this. The same reproach does not lie at the door of Octave Feuillet, for there are bright as well as dark colors on his canvas. Yet all have aided in confirming the popular impression abroad, as to the immorality of social life in France; and the looseness not only of the morals but of the manners of all classes, owing to the absence of those domestic habits, and the exercise of those virtues, which brighten the social circle, and make a paradise of home.

But one of these three romances has been translated and republished here, and that the least objectionable of them all—"Camors." It is to be hoped that we may be spared seeing "Les Grandes Dames" of Houssaye figuring in English dress on Broadway, where we have already more than enough of their erring sisters.

Space will not permit the continuation of this theme in the present paper, but, with the kind permission of all parties interested, the topic shall be resumed in a subsequent number, and an attempt made to prove, to the satisfaction of all unprejudiced minds, that the charming picture of "Life in a French Country-house," drawn by a female hand, is not an exceptional one; and that in France, as elsewhere, the Virtues as well as the Graces may be found to preside over happy homes, and sit by private hearthstones, even amidst the rush and roar, the strife and sin of its great cities.

## THE STUDY OF LANGUAGE.

WHAT place shall be assigned to language in courses of study is one of the vexed questions of modern education. Are Latin and Greek indispensable? Shall one or two or half a dozen modern languages be learned? Is the acquisition of both the ancient and the modern tongues to be recommended, or shall both be neglected, and the student's attention confined to the study of his native speech? These are questions which must be variously answered in different circumstances, and the chief difficulty that has arisen, we apprehend, has grown out of the neglect of this consideration. The assumed necessity, that each institution of learning should have a definite curriculum or scheme of study, presupposes some fixed theory of study to which the curriculum is conformed; and, as each institution appeals to all classes of students, it is naturally committed to one scheme of study for all. But the principle is erroneous and the practice bad; while the increasing tendency to substitute elective courses of study for a uniform course shows that the unsoundness of the old proceeding is gradually becoming recognized. We shall consider this important subject in future numbers of the JOURNAL; our present business is with another aspect of it.

It being admitted that the study of languages—whether living or dead, one or many—is of great importance in education, the inquiry arises in regard to the best means of its acquisition. As respects this, we are at present without definite principles or a rational practice. While, on the one hand, there is no branch of education so given over to blind tradition and slavish routine, so, on the other, there is none which teems with such a multiplicity of new and conflicting “systems of teaching;” both evils being due to the want of any well-settled views of what is to be aimed at in the study of languages, and of the conditions upon which their successful acquisition depends. Nothing was, therefore, more needed in education than an exposition of the principles by which these studies should be guided. An attempt in this direction has lately been made, which well merits the attention of parents and teachers.

There appeared in London, in 1853, a work in two volumes, entitled, “Language as a Means of Mental Culture and International Communication,” by C. Marcel. It was an original, advanced, and most important contribution to the philosophy of linguistic study. It is quoted as an authority by various writers on education, and we have heard several teachers acknowledge their indebtedness to it for guidance in the treatment of philological studies. But the subject was treated too elaborately for the best effect, and the work was too voluminous for general circulation. In the mean time the author has elaborated his ideas with greater precision, and has compressed them into a neat little volume, of 228 pages, entitled “The Study of Languages brought back to its True Principles.” He has translated his own work into English, which is now before us, and nothing could better illustrate the truthfulness of his views than the quality of the performance he here offers us, in what is, to him, a foreign language. In the prefatory notice to the present edition, by an American friend who has superintended its passage through the press, it is observed: “The author is a French scholar of rare philosophical culture and linguistic accomplishments, who, for many years, has pursued the method in his own studies which he recommends to his readers. His success is brilliantly illustrated by the vigor and idiomatic purity which mark the composition of this volume. He handles the English language with the force and precision of a native writer; and often awakens an interest in his ideas by the simple beauty of his style. His little work is not a manual but a method; and is equally applicable to the different systems in which text-books have been written.”

In his preliminary chapter on the order of linguistic study, M. Marcel divides the work of acquisition into two processes,

which he calls IMPRESSION and EXPRESSION. *Impression* of language is effected by the arts of hearing and reading; *Expression* of language involves the operations of speaking and writing, and the first named is, of course, prefatory to the last. In the spontaneous acquisition of language, as by children, the first step is to listen and learn to understand the spoken words, and the second is to learn to speak; the third step is to understand written language, and the fourth to write.

But, in the acquisition of a foreign language, the order is different. In the first instance, the passage of the learner is from ideas to the signs of ideas; in the second, it is from signs to signs—that is, from one language to another. The order of acquisition now becomes:

1. The art of reading, { IMPRESSION.
2. The art of hearing, {
3. The art of speaking, { EXPRESSION.
4. The art of writing, {

This order indicates the plan of the work; the four arts here enumerated being successively treated in four elaborate chapters. Without attempting here to reproduce Marcel's method, which would be unsatisfactory in a single article, we will confine ourselves to a few suggestions and extracts.

Respecting the time at which the study of language should be entered upon, this depends upon the method adopted. The spontaneous or natural method may be made available in early childhood, and this is, beyond doubt, the true course to be pursued. If the curiosity and imitation, which are so strong in young children, were brought into play for the acquisition of an extra language at the time they are learning the vernacular, it would be a vast mental economy.

“If an infant be spoken to in a foreign as frequently as in his native tongue, he will become equally familiar with both. He might, in this way, solely guided by nature, learn from the cradle two or three languages without confounding them, if brought into daily contact with persons who spoke them in his presence, as is frequently the case in the higher classes of society, in which children learn the use of several languages. They have governesses and servants of different countries, who always address them each in his own language.”

But, in acquiring a new language by the comparative method, that is, by translating it into one already known, M. Marcel is of opinion that mistakes are often made by beginning too early:

“Before the age of twelve or thirteen, a child cannot learn a language from books by the aid of his own; the weakness of his understanding, his want of motives for study, and his reluctance for sedentary occupations, thwart the efforts of the master, who then employs more time in ascertaining whether his pupils have clearly understood him, and have learned their lessons, than he devotes to real teaching. This observation applies more particularly to classical studies; they are commenced too soon and commenced the wrong way. It cannot even be said, in favor of the early study of a foreign idiom, that it makes a deeper impression on the mind; out of a hundred persons who have studied a language by the comparative method before their twelfth year, ninety-nine have but a faint recollection of it a few years after they have left school. The incomplete knowledge which a young child possesses either of things or of his own language is, as well as the immaturity of his intellect, an impediment to his comprehending foreign authors.”

As regards the age at which languages may be learned, it is remarked in another place:

“By following simple and natural processes in harmony with the end proposed, such as those we recommend, there can be no doubt that, in the maturity of reason, even at an advanced age, a person might, in six months, acquire what is useful in a living language, better than a boy of ten could do so in as many years, by the ordinary routine. The greatest linguists, from the Scaligers to Elihu Burritt, the learned blacksmith of Massachusetts, who is said to have learned above twenty languages, have nearly all acquired them in the maturity of life, and without masters, by following a method similar to the one we have sketched.

"Plutarch, who began the study of Latin late in life, made rapid progress, because, as he himself says, his knowledge of things enabled him to enter into the thought of the writers. Themistocles, also advanced in years, learned Persian so well in one year, says his biographer, that he used to converse with the King of Persia on state affairs better than the Persians themselves. Cato the Censor learned Greek in his old age, and knew it thoroughly. Alfieri began the study of that language at forty-eight, and attained a high reputation as a Hel-lenist. Sir William Jones had passed his thirtieth year when he began to learn Eastern languages, in which he is known to have been deeply versed. Ogilby, the English translator of Virgil and Homer, had been a dancing-master; he did not know a word of Latin at forty, nor of Greek at fifty-four. Maugard, a distinguished man of letters, became, after three months of study, a successful teacher of Italian and Spanish, which he had learned in his sixtieth year. The celebrated Dr. Johnson undertook, when seventy years of age, the study of Dutch, with a view to test his capability to learn: the success of the experiment fully satisfied him that the powers of his mind were still unimpaired. Richard Cumberland, Bishop of Peterborough, at the age of eighty-three, learned the Coptic language, in order to read the Coptic New Testament, which Dr. Wilkins had just published."

In the chapter on the "Art of Reading" the author observes:

"The mode of proceeding at the commencement should be nearly as follows: To devote exclusively to the translation of the first volumes all the time one has for study in the absence of the teacher, to go several times over the same passages for some weeks, to peruse every day the lesson of the day before, and gradually throw off dependence on the translation opposite. As the work becomes easier, more will be translated in a given time, and the learner will soon be able to dispense with auxiliary aids.

"Repetition is the grand principle on which depends the efficacy of the processes required for gaining a practical knowledge of a language. To impart to the intellectual powers a certain freedom of action, repetition is as necessary as exercise to the limbs. Six months of continuous application will lead to greater proficiency than twelve months of lessons with frequent interruptions. Habits of language can be created only by keeping the same words and phrases in rapid succession before the mind: the same number of impressions which, when closely following each other, produce a habit, would fail to do so, if separated by long intervals."

M. Marcel's motto in the study of languages is, "One thing at a time," or Macchiavelli's maxim, "Divide and conquer." In his chapter on the "Art of Hearing" he condemns the practice of attempting to acquire the signification and the pronunciation of words at the same time, and points out the mental disturbance which arises from the unequal action of the eye and ear:

"It is a great mistake to imagine that, in the study of a living language, the pronunciation should be taught first. It does not in any way facilitate the understanding of the written words; and, besides, a person may perfectly understand what he hears, without being able to pronounce correctly. In infancy we know the meaning of words long before we can utter them. In learning a foreign language we ought also to understand the spoken words before attempting to articulate them.

"To study simultaneously both the pronunciation and the signification of words at the beginning is incompatible with that law of our mental organization which forbids attention to be directed at the same time to several distinct things when new.

"In the course of the exercises in audition, the learners should forbear looking at what is read to them, that the ideas may be exclusively received through the articulate words, as when listening to a speaker. If a person familiar with the written language had his eyes fixed on the book while the instructor was reading, that organ, quicker than the ear and not easily controlled, would not always patiently accompany the reader word for word, but would outstrip the ear in apprehending the subject. Sometimes also a person less advanced will be slow in following the teacher, or will stop to consider the words which are not familiar to him; so that, in either case, the learner would be unmindful of what is read, and the idea would be apprehended through the eye, not through the ear.

"The learner also, occasionally perceiving letters which are not pronounced, would be apt to attribute his not hearing them to inattention or dullness of hearing on his part, and might still be inclined to introduce them in his pronunciation afterward. It is, therefore, better not to give the eye an opportunity of leading the ear astray. Besides, this dependence on the sight for understanding what is heard, incapacitates the ear for conversation, in which it can have no assistance from the eye."

## CHILDHOOD IN MODERN LITERATURE.

THE dimpled darlings of our household, the little demi-deities of the cradle, do not grace the ancient as they do our modern literature. They were often enough in the arms of Greek mothers, but seldom in the writings of Greek fathers. The frightened Trojan babe, scared by the dazzling helm and nodding crest of Hector, is a charming picture, but slight as the painter's glimpse of a cherub. The "Iliad" gives no studied picture of childhood—gives it no expression like that of modern poetry.

The child—the sanctity, freshness, and mystery of child-life—in literature, owes its advancement beyond the idea of a healthy little animal to the worship of the infant Jesus. In contemporary literature childhood is a special and individual presence, not an accidental and accessory one. It was a French poet who made the most touching verses about the sweet and simple and enchanting life of children. Victor Hugo's "Les Enfants" is the first book of poetry which exclusively celebrates childhood; and it is a charming and pathetic volume, full of music, of tenderness, of tears, of brightness, felicitously called "The Mother's Book." The heart of a robust and grand poet has softened and melted before the altar of domestic life; he sings the ministrations of children. The untroubled laughter, the fleeting tears, the sinless dreams and memories, the glowing and spotless aspect of childhood, like the faces of cherubs smiling from funeral tablets, crowd out all sombre and bitter recollections of life. He says of a child, sleeping on the maternal bed, that "when his rose-eyelid closes on the earth, it is opened to heaven." Nothing like Victor Hugo's book is to be met with anterior to our century, which has advanced childhood to the same place in literature that it held in religion and art. When the monsters vanished, the child appeared. The dragon, the hydra, and the dwarf, which exhaust the descriptive powers of the old poets and romancers, have given place to the untouched and all-promising and exquisite child.

The cradle is the only undisturbed throne to-day. "Philip my King" is undisputed monarch on the mother's breast.

A modern poet has expressed the sanctity of the power of childhood when he makes the chagrined and despairing lover utter, in his inconsolable anguish—

"Baby fingers, waxen touches, press me from the mother's breast."

Miss Mulock's "Philip my King" is a beautiful expression of the royal grace and power of childhood. But, if less vivid as it is less of a portrait, more touching, because connected with the reflective and saddened spirit of the father, is Longfellow's poem of "Childhood."

The very flower of modern literature may be said to blossom in the sentiment inspired by childhood. That sentiment is not pagan nor heathen; it is preëminently Christian. And what children it has consecrated in our memory! "Mignon," the unique, the studied, the profoundly-suggestive, and strange creation of the great Goethe—a truly "mysterious child; the daughter of enthusiasm, rapture, passion, and despair; she is of the earth, but not earthly." In our own literature we have "Pearl" and "Pansy," the creation of a poet, Hawthorne; we have "Topsy" and "Eva," the creation of a homely but dramatic genius, H. B. Stowe. And, in the children of Hawthorne's romances, what capricious and exquisite life! What contrast! What rainbow-tints opposed to the fixed and sombre

destiny of the unhappy mother! What delicacy of color; what play of sentiment. What charm, as of pearled dew-drops! What cooling freshness, as of their lucid beauty! These figures of childhood are special to our literature.

Sad like a mute household, grave like a senate-chamber, stormy like a mob, and gorgeous like a festival, are those pages of literature anterior to our modern epoch, which never show us the untroubled face, the glad glance, and the beautiful smile of childhood. The presence of childhood in our modern literature is beautiful like its dimpled hand on a white beard—something tender, soft, rosy, feeble, irresistible. Childhood in letters is like the blossomful branch in spring-time—fragile beauty of texture and color laid on the rough limbs and over the grasping roots of sturdy life. The child is light and fresh and beautiful in letters as in life.

Long before our modern literature embodied much of the life of children, art had scattered its laughing and smoothly-curved images over the fronts of palaces, about altars, and in pictures. The first service of art was religious, and the Christian religion had devoted it to the cradle in Bethlehem. Where the *child* has not been, where its presence is not felt in literature, we have distressing and agitating writing; we have the wan splendor and misery of life laid before us, at best the triumph of power and passion. The child changes all that is sombre, and transmutes all that is tragic, into all that is hopeful. Childhood is the very flower of life: how could it be less than a joyous garland in letters for the stricken brow of thought? It is sad only when touched with our sadness, and cursed by our want. We can look into the blue eyes of children, and think of lakes; we look at their curly, careless heads, and are gladdened as by sunshine; at their cheeks, and are pleased as by the soft petals of flowers.

The literature of despair would have one ray of light if childhood appeared in it. What a relief to overtaxed sympathies is the presence of children in "Werther!" What gladness we have to see the shining, heedless heads of the little ones about "Charlotte!"

Children have been individualized in modern literature. The sculptors of the renaissance, as its painters, did not represent the individual. They generalized; the cherubs of the painters and sculptors are typical. The first child that inspires a profound and personal interest is Goethe's "Mignon;" it is subtly individualized. Less poetic, less imaginative, as creations, but closer to us, are Mrs. Stowe's "Topsy" and "Eva," George Eliot's "Maggie," and Charlotte Brontë's creation in "Vilette." Wordsworth's little girl in "We are Seven" is suggestive and touching; the simplicity and naïve persistency of childhood were never more felicitously expressed. Aldrich's reputation as a poet was made by, and will probably rest upon, "Babie Bell," with its music and fancy and charm, and the perfumed and dainty and touching grace of which mixes with our very dreams of babyhood, and seems not less exquisite than the gift of its life.

It is worthy of remark, that authors, whose genius is fed by passion, have not given any place to childhood in their writings. Victor Hugo is the only exception. Neither in the works of Alfred de Musset, nor in George Sand, nor in Rousseau, nor in Burns, nor in Poe, do we find the figure of a child. Writers deficient in passion, but tender and contemplative, like Wordsworth, Longfellow, Whittier, and Hawthorne, or simply domestic, like Mrs. Stowe, have frequently given us portraits of children, and have expressed the beautiful fact and sentiment of their most personal life.

Hail to children! Their glad faces, their fleeting tears, their playfulness, have interested us more than "Tom Jones" or the "Red-Cross Knight." "Cosette" is almost as beautiful as "heavenly Una." Children! They rule the world. The mother and the child are the two sacred figures in our modern life and literature. We have no fair and fatal Venus, no Druid priestess, no white vestal, keeping the sacred fires of sanguinary

altars, but simply woman and child to enlist the enthusiasm of love. A blossomless bough, a fruitless tree, a nestless bush—these are not more dull and dead to the eye than a home without children. Literature not graced by them may be grave and grand, stormy and splendid; it may be tragic with passion like Byron, melancholy like Lamartine, lyric with love like De Musset, but it has nothing of the pure and tender spirit of the most beautiful pages consecrated to childhood.

### THE OTTER, THE FISHERMAN'S ALLY.

THIS carnivorous quadruped conforms to the habits of his order by asking of the earth a place of shelter, but his sphere of action lies in the waters. The sea-otter is practically amphibious, and touches the seal in the transition between quadrupeds and the mammals of the ocean.

No animal series is complete without affiliation with neighboring series. While the carnivorous quadrupeds invade, by the bat tribes, the domain of air, they plunge into the waters by amphibia. The otter, like the seal, is piscivorous, naturally preferring the flesh of pike or carp to that of rabbit or lamb. It has affinities of character with the water-spaniel by its extreme docility, its playful affection, and in being an auxiliary of the sportsman, when the latter is intelligent enough to behold in it something more than a troublesome rival or even than a precious fur. The series of carnivorous hunters, in harmony with Nature's order, casts this genus into the domain of the waters where it works in fellowship with the cormorant, to the profit and pleasure of the Chinese fisherman. So in another sphere the falcon completes the pleasures of the chase, which it shares with the dog, the horse, and man. These social characteristics are far more important to be known and felt than are the anatomical points to be learned by dissecting the dead body of a beast. To the former, accordingly, we invite our readers' attention under the guidance of M. A. Toussenel, the great hunter-naturalist of our epoch. "I am disposed," says he, "to great indulgence toward my civilized fellow-creatures, because they are victims of their own ignorance in many things, but what I can hardly understand is their stupid indifference with regard to the otter. This animal was destined to hunt the waters and share the piscatory spoil with man, not to be itself hunted; and it should therefore rank among the beasts to be preserved. Men complain of the deficiency of fishing-dogs: the otter was given to console them; yet, instead of making this good-natured beast their ally in the chase of fish, they make an enemy of it—they set a price upon its skin."

Take a young otter from its mother's breast, be amiable with it, caress it as you pet your puppies, and it will soon come to cherish the same attachment for you as your spaniel; it will follow you everywhere, will grieve for your absence, will salute your return with little stampings of joy, and, when you have indoctrinated it with your opinions on the superiority of butcher's meat over fish, it will be converted to that faith. Request it then to seek for you in a neighboring river or pond a respectable fish, it will plunge headforemost and presently bring it to your feet. Take care, however, on such occasions, to influence its morals by a slice of beef or mutton, which it will not be indelicate to present to it in exchange for its booty. At Verdun-sur-Meuse, not long since, I saw an otter thus trained, who was the delight of his master and the admiration of all amateurs. The history of unfortunate Poland records the glory and the fate of an otter, the pet of King Casimir, whose wonderful craft long excited the envy of all the water-spaniels at court. A soldier, on guard at the palace, assassinated it one day, to make a muff of its skin for his sweetheart. Its royal master wept for it. The Swedish nobles also are recorded to have kept otters in their service, which would go, at a signal from the cook, catch fish, and bring it into the kitchen to be dressed for dinner. Audubon and Bachman say, that "young otters, raised by one

of them, became, in two or three days, as gentle as the pups of the domestic dog. They preferred milk and mush to either fish or meat of any kind, until they were several months old. On entering our study they would crawl into our lap, mount upon our table, and romp among our books and papers, often upsetting the inkstand."

The Chinese, whom we treat like a community of maggots, and who retort upon Europe the stigma of barbarism, are far more advanced than ourselves in the art of making use of beasts, and have for centuries completely domesticated the otter. These creatures are trained to fish in company, to attack, to pursue, to snap up and to deliver their game. This is a much more animated sport than line-fishing, and we may ask in behalf of the Chinese, however inferior to us in the arts of bombarding unresisting cities, and of poisoning foreign nations by compulsory commerce with narcotic drugs, whether the art of instructing intelligent beasts is not a higher and a better occupation.

The remarkable examples which the otter has given of his intelligence and docility whenever a fair trial has been made of these qualities, have not yet succeeded in opening the eyes of our poor fishermen, and they have declared upon him a war of extermination, instead of seeking to make use of his superior aptitudes. Then the otter, exasperated and forced to make reprisals, takes most lively pleasure in depopulating the ponds and streams. Some of them have been known, as if with the desire of raising the jealous fury of the fisherman to a white heat, to amuse themselves with strewing every night his favorite haunts with the bones of immense carps and other fishes.

One of the poacher's keenest enjoyments is to poach under the beard of the police and the public order, when he is protected against them by any barrier, a river for example. The otter, which has often chanced to witness this manœuvre, delights to imitate it. As it knows very nearly the range of a shot-gun, it likes to amuse itself by sitting on the bank at a respectable distance from the marksman. It breakfasts familiarly before him, rolls on the sand, and gambols provokingly. Some pretend to go to sleep at the noise of the firing.

There are otters also who have sworn eternal hatred to civilized institutions, and have decreed the penalty of death against any one amongst them who should betray the right of free fishery, by entering the service of man. And the tamed otters know so well the fate that awaits them in the society of their brothers and sisters of the Wilde, that you cannot make them put one paw before the other on days when they have wind, by sight, scent, or hearing, of a free member of their family.

The otter-chase is really an ambush; dogs, however, some-

times hunt it. It is also taken, without much trouble, in snares. It gives birth to five or six young in the spring, the little ones repairing to the water like young ducks, as soon as they have strength to walk. It earths itself under shaded banks, under rocks, or the roots of old trees. Audubon has found otters nestled in the hollow of a tree, on a bed of water-grasses, strings of inner bark, and other soft substances. The hole leading up into their nests is always burrowed under water. The otter plunges into snow as into water, when dogs pursue it, and when the river, its natural refuge, is frozen by a hard winter. Its rapid succession of sudden appearances and disappearances is certainly the most curious of all the manœuvres of the chase that I have ever witnessed. The favorite sport

of the otter, says Mr. Godman, is sliding. For this purpose, in winter, the highest ridge of snow is selected, to the top of which the otter scrambles, where, lying on the belly with the fore-feet bent backward, 'they give themselves an impulse with their hind-legs and swiftly glide head foremost down the slope, sometimes for twenty yards. This sport they continue apparently with the keenest enjoyment, until fatigue or hunger induces them to desist. Cartright, Hearne, Richardson, and Audubon confirm this observation.

Travellers, who have fished in China, relate having seen good otters, well trained, sold frequently at the price of four hundred dollars. Why have our fishermen and poachers never conceived the idea of establishing a primary school for the education of otters, as one has been started in the Pyrenees for the bears?

The statistics of the French otter-hunting show that an average of four thousand otters are annually destroyed in France. But this destruction is chiefly effected by snares

and ambushes, together with the help of the dog, which is thus *particeps criminis*.

All treatises on hunting, in French, English, Spanish, German, etc., expatiate in detail on the chase of the otter with dogs. It is hard, at first, to understand how a beast that does not leave the water can be hunted by dogs that do not leave the land, but this is better seen on the field of manœuvres. The otter must come often to the surface, and is pursued along small water-courses where the dogs can keep the banks. In Lorraine I have seen poor devils of otter-hunters travel twenty-four miles in chase of the same animal, and miss him at last or be overtaken by night. They caught, I'll warrant, more rheumatisms and pleurisies than bank-notes. At least three are needed for this villany—two men and one dog. The men are armed with long lances to thrust into every hole, while the successful dog requires uncommon courage, scent, and perseverance; and, as servants of this merit are not sold by the gross, it results that the true otter-chase has but few amateurs.

The American otter (*Lutra Canadensis*) inhabits our whole range of fresh waters, but is more frequently met between Chesapeake Bay and the Mexican Gulf. Audubon finds but one species, varying with the climate, in its fur like the raccoon, the mink, or the rabbit. The sea-otter is nearly twice as big as his fresh-water cousin, and has the finest fur. It inhabits isles and deltas of the North Pacific coast of both continents, and used to abound near San Francisco.

J. W. Audubon saw one in the San Joaquin River, where the bulrushes grew thickly. It suddenly emerged upon a drift-log, a hundred yards above the party. On being shot at, it slid into the water and sank without a ripple, but after a minute raised its head and then began diving as after fish. It seemed as much at ease in the water as a grebe, and remained under the surface as long as a loon. After a second shot it appeared frightened, swam rapidly to the opposite shore, and disappeared in the rushes. "It seems," says Sir John Richardson, "to have more the manners of the seal than of the land-otter. It frequents rocks washed by the sea, resides mostly in the water, and is often seen very remote from the shore."

### TABLE-TALK.

THERE has been some discussion about the title and subtitle of Victor Hugo's present romance, both in the original and the translation. The name of a work is a more important matter than the casual reader supposes. The French say it is the most important part of a work of fiction, especially a drama. The name of a French play, even an ordinary *vaudeville*, is often changed three or four times, after consultations, numerous and serious, of the manager, the authors, and their friends. It is not altogether unamusing to note, in this connection, that minor authors (the great stars, we suppose, must

always be allowed to choose for themselves) are constantly disagreeing with their publishers about the titles of their works. To maintain that one side is invariably wrong in these differences of judgment, would be a rash generalization. Sometimes the author has good reason to complain. The late Henry P. Leland contributed to a magazine some very amusing sketches of artist-life in Italy, under the neat and appropriate title of "Maccaroni and Canvas." When these were afterward collected into a volume, the publisher called the book "Americans at Rome," which was a threefold misnomer. The persons treated of were not Americans generally, but American artists; they were not Americans only, but artists from various countries; finally, they were not merely at Rome, for some of the sketches referred to other Italian localities. In this case we may suppose the publisher seduced by the word *American*. Publishers and editors have, or used to have, a weakness for the word *American*, as implying something grandiose, wide-reaching, and necessarily popular. A fugitive writer, at intervals of several years, contributed, to two English periodicals and an American paper, three series of what the French call *études*, all having titles with direct reference to their subjects. He was somewhat surprised and amused to note that the three editors, in different countries and at different times, all wished to change these titles for the same general one, "Sketches of American Society." On the other hand, a publisher's technical knowledge often saves an author from a title already appropriated, or likely to mislead, or objectionable on some other account. The writer of a treatise on government, published not long ago in this city, wished to give it a name which would have caused it to be mistaken for a novel. Thus far we have been proceeding on the supposition that the title of a literary work should have some connection with the subject; but the illustrious authority of Sir Walter Scott reminds us that there are two opinions about that matter. Scott instanced his "Ivanhoe" as a *perfect* title for a romance, because "it gave no hint of the story." A hypercritic might have joined issue with him, and contended that *Ivanhoe*, being the name of an English manor, suggested an English story. It would be possible even to refine on this point, and to argue that the name was not only suggestive, but misleading. Many titles of books have been misleading, some intentionally, some unintentionally. The "Purple Island" of Fletcher's old poem is the *human heart*. There is a quaint book of the last century called "Wanley's Wonders of the Little World." The *little world* is man, often styled by philosophers a *microcosm*, and the work is made up of stories, true and false, about the fortunes, virtues, sins, caprices, and deformities of various individuals and personages. In our own time we have "Ruskin on Sheepfolds," not agricultural, but architectural folds; and Miss Evans's "Mill on the Floss," which, appearing as it did just at the time of the Heenan and Sayers fight, was largely purchased by such of the pugilistic fraternity as could read, under the impression that it was a sporting novel. Indeed, this unlucky title gave rise to a double batch of mistakes, many booksellers supposing the "Mill" to be a proper name, whence it appeared in catalogues thus:

Mill on Liberty.

— on Political Economy.

— on the Floss.

The main title of Victor Hugo's present romance is, in some respects, a misleading one, as the reader will be able to see for himself by-and-by.

The gift of \$750,000 by Mr. Peabody, to erect suitable buildings for the poor of London, has been expended, and the trustees report completed accommodations for 1,971 persons, who are workmen of all kinds, with average wages of \$5.25 per week. The trustees state that, in the organization and management of these buildings, it has been their study to impose no restrictions on the entire freedom of action of any tenant, so far as is consistent with the comfort and convenience of all:

there are no rules which interfere in the slightest degree with their privacy or independence; all have uninterrupted ingress and egress at all hours, are as fully masters of their houses, and can live in as much seclusion and retirement, as if dwelling in any other building in the adjacent streets.

They state that the sanitary condition of the buildings shows an entire exemption from endemic diseases and from those complaints incident to low and crowded localities. Good ventilation and cleanliness are characteristic of the dwellings. An unlimited supply of water and bath-rooms free to every tenant, together with enclosed playgrounds for the children, have already produced a salutary effect, not only among the young, but perceptibly in the increased tidiness and cleanliness of the old.

The laborers are allowed the use of these privileges at the lowest possible rent, and much good will be done, not only by the immediate and direct relief which will be afforded, but by setting an example, on a conspicuous scale, of what can be done to help the working-classes. Mr. Peabody has subsequently added two donations of half a million dollars each, to erect lodging-houses in different parts of London.

The passers through Union Square, New York, on a bright March Sabbath, were amused by a performance, certainly not "down in the bills," which constitute the free picture-gallery of that part of the city. Two little girls were playing by one of the hard, backless benches which belong to the conventional discomforts of city-squares, and one of them, a little blooming four-year-old, was "laid out" on the bench. Her dress of crimson wool was spread over it, so as to extend around her like the leaves of a great rose of which she was the heart, and a gray shawl covered the plump ankles and simulated the wind-ing-sheet. The fat little fingers overcame the difficulty of folding themselves, the wide-awake blue eyes consented to be shut, and the irrepressible mirth at the corners of the rosy mouth did its best to grow quiet into the sweet likeness of a marble sleep. Then the companion became the mourner, and the two children were playing dead.

Happy, holy childhood, so unstained and pure, that the grim terror of humanity is to them but as the sunshine and the flowers, and to whom the skeleton myth of our manhood becomes only a rosy plaything for babes! Is not Greenwood full of such children, who have only lain down there to look up soon on the sweet-faced angel of the resurrection, and laugh as they tell him they have been playing dead?

Of all the immigrants the Old World has sent us, none have a kindlier appreciation than the little English sparrows, now so numerous in all our parks and streets. We hear their gay chirp when we wake in the morning, and find them in our daily walks, if trees or green squares lie in our way, hopping in and out of our path, and making the city streets cheerful and pleasant with their happy twitterings. One may always pause, if in Union, Madison, or Washington Square, and watch their lively antics with genuine pleasure. They are so unmindful of your presence, that a wing will, at times, almost brush your face. They carry on all their affairs, heedless of the group of admirers that so often collect to observe them—sing their love-songs, choose their mates, build their nests, nurse their young, make their bath, and look like little incarnations of peace and happiness, without a thought or notice of the heart-sore crowds of men and women around them.

In Union Square, somebody, with more zeal than taste, has erected what he calls a "Sparrow Hotel." It is a big, elaborate structure, containing several hundred apartments for nests, painted and gilded to the highest possibility of gayety, and decorated to excess with eccentric ornaments. The sparrows, however, with delightful good taste, prefer the brown little boxes hid away among the leaves of shady trees, and only take

up their homes in the gay "hotel" when modest quarters cannot be found. It seems strange that our city authorities have not the power to prevent public grounds from being made an arena in which anybody may display his crude and vulgar tastes. The sparrows are delightful additions to our pleasure-grounds; may they multiply! but spare us, zealous friends, from these childish and vulgar devices, erected in the name of beauty, but which, in truth, are so detestably ugly!

The condition of the English work-people in mines and factories still forms a matter for official investigation and public discussion. The report of a Parliamentary committee, appointed for an inspection of factories, condemns the employment of women on pit-banks and in clay-mines, and draws a painful picture of the morals and manners of these workers. Their scanty dresses, the attitudes they are compelled to assume, the evil associations they form, "tend to an obscenity of language and manner which cannot be described." "A woman," the report goes on to say, "could hardly work in these yards, bespattered with clay, and a witness to the most brutalizing examples, while she had any purity of moral sense. But, driven as a child from home by the spendthrift sensuality of parental greed, she is early initiated to a most degraded condition of life, and, day by day covered with the dirt of her occupation, no wonder she delights in every thing which adds to her material indulgences, and becomes the pariah she is."

The *London Student*, established recently under the management of a corps of able professors, died before it was six months old; and now the *Museum*, for some years the leading English educational monthly, announces its own demise with the last issue.

Why is this? and why is it that our own educational journals drag out their existence at such a "poor dying rate," that the presumptions are constantly against their continuance, while many of them can only maintain the breath of life by voluntary subsidies or State aid? It is not because the subject is uninteresting, for there is to-day, to the very borders of civilization, a deeper concern in educational questions than the world has ever before witnessed. It is not because the subject is exhausted; for, when taken up by bold and independent minds, new aspects of it are constantly presented, which arrest universal attention and command the public sympathy. The reason is, that educational journals are professional, and therefore appeal to a narrow constituency. They are not designed for the general public, and therefore do not reach it. Pedagogical in spirit, dealing with the technicalities of instruction, and squabbling interminably over petty questions of school-room detail, they are absorbed in matters which pertain specially to teachers, and the public consequently cares little about them. Another reason for this public neglect is, that there is a wide-spread instinctive feeling that what now passes under the name of education, and the claims of which are so loudly vaunted, is very far from being the thing which this age requires. There is a chaos of views and a conflict of systems which indicate a period of profound transition. There is a distrust of our inherited methods, and a hope of something better; and, as teachers are generally the salaried dependants of an existing system, they are tacitly regarded, whether justly or not, as its defenders, and their literature as belonging to the past rather than to the present or the future.

No doubt, teachers must have their own journals devoted to their class interests, but, with reference to education as a public concernment, the people will look to the public press for discussion and enlightenment. The truth is, education has a relation to the general welfare of society, and to other public questions, so intimate and vital as to forbid its divorce from them in popular thought. Hence journals exclusively educational are very little cared for.

The fifth number of APPLETONS' JOURNAL will be accompanied by a cartoon, the same size as the one presented with the first number, giving a view of the Levee at New Orleans, a scene conceded to be one of the most varied and bustling of any in America.

### Literary and Scientific Notes.

THE *London Examiner* gives a lengthy and very appreciative review of Mr. F. O. C. Darley's "Sketches Abroad with Pen and Pencil." This charming little volume, in which Mr. Darley first appears as an author, gives one of the most graphic pictures of European life the press has recently produced. The *Examiner* says of it: "We wish it were in our power to communicate in some way the interest with which these admirable sketches may be said to inspire the book, but it would be useless to attempt a description of them; we can only say they are numerous and varied, always spirited and piquant. We strongly recommend our readers to procure the book. We have dwelt chiefly on the art-criticism, because we felt that that was our author's strongest point, where we found the most original ideas; but the little volume is full of the pleasant experiences of travel. It is written with the buoyant spirit of a man who is enjoying himself thoroughly, with the discrimination of one who can duly appreciate the treasures, the antiquities, or the novelties that are shown to him."

The bee-fanciers of Germany have had a convention at Darmstadt. The German *Bee Journal* says, that when the celebrated bee-masters arrived at the Darmstadt station, although they had never met before, yet recognizing each other by long photographic familiarity, they rushed into each other's arms and embraced, kissed, and squeezed hands with a sentiment and enthusiasm which is rarely manifested outside of Germany. Professor Leuckart gave an interesting discourse on social insects: bees, humble-bees, insects, and wasps. In the course of his remarks he made a curious calculation on the productiveness of the queen-bee. The queen-wasp, he observed, having, when she first begins her nest, not only to lay eggs, but also to feed the brood, can at first lay but sparingly. When the first workers are hatched, they begin to help her in building cells, as well as in feeding the brood, and her fertility is thus developed apace. In the case of the honey-bee, however, there being more or less workers in the hive the year through, the queen is able to devote herself more entirely to laying eggs, and the stronger the hive the more her fertility is stimulated. Thus, in good hives, he reckoned that queens, weighing 100 grains, would produce, in a year, 13,000 grains of eggs, or 130 times their own weight. Now, a hen, he reckons, produces only five times its own weight; so that, for a hen to equal the productiveness of the queen-bee, she must lay twenty eggs a day throughout the year, while the woman, to be equal, must have three or four children a day! Such is the effect of the division of labor, which is carried to such an extent in the hive, that the queen is exclusively an egg-laying machine.

Dzierzon stated that he attributed the size of the queens to the more or less plentiful supply of pollen in bee-bread furnished to the larvae. Should the bees, at the season when the grubs of the queens have to be fed, be too much occupied in collecting honey, the queens are apt to be born of smaller size than usual.

The question arose at what age bees first fly from the hive, and when they become honey-carriers. Von Berlepsch had fixed sixteen days from the birth of the bee as the period when she first begins to carry honey, making thirty-five or thirty-six from the laying of the egg. Dzierzon was inclined to think that this depended on temperature, season, and other circumstances. For instance, he considered, that if, by changing the place of a hive, it had been deprived of most of its carrier-bees, the young bees would be found to fly out to pasture at a week old.

Mr. Samuel Bowles, of Springfield, has given us a second volume of Western travel, which is fully as agreeable and instructive as his first. The title of the volume just issued is, "A Summer Vacation in the Parks and Mountains of Colorado." It carries the reader over the track of the Union Pacific Railway, and sets before him succinctly and clearly all the great features and statistics of that important region of country. The growth of the mineral interests of Colorado Mr. Bowles considers almost without limit. The mountains, he declares, are full of ores holding fifteen to forty dollars' worth of the metals per ton.

After doing it many times before, Oxford has again beaten Cambridge in the rowing-match. The *Pull-Mall Gazette* says that this is due to the fact that Oxford has a quick stroke of the oars, and Cambridge a slow stroke. By quicker, it refers to the time the oar-blade is in the water, not to the frequency of the stroke. The object in rowing is to produce

motion; not motion of the water, but motion of the boat; and, as the rower's force is a fixed quantity, all that he expends to produce movement of the water is so much deducted from the motion of the boat. Oxford, with its short, quick stroke, moves little or no water aft, the oar pressing as a lever against an almost fixed fulcrum; while Cambridge, with its long, slow stroke against a yielding fulcrum, moves a considerable quantity of water aft, which is so much taken from the propulsion of the boat. Oxford wins by striking its oar against the water, and withdrawing it before the water takes up its motion. Oxford moves the most boat, Cambridge the most water.

It is often said that insanity is on the increase with the growth of civilization, and the statement has been as often denied. The last elaborate statistical investigation of the subject is by Dr. Lockhart Robinson, an eminent alienist of England, who denies the alleged increasing tendency. He does not question that there are more insane persons now than formerly, in proportion to the population, but says that this higher ratio is due to the fact that, from better care and treatment, they live longer than they did, and therefore accumulate. Dr. Robinson read his paper before the Medico-Psychological Association, by whom it was generally concurred in.

Miss Martineau's "Biographical Sketches" have been reprinted in this country, by Leypold & Holt, in a very neat and pleasant-looking volume. These sketches were first published in the *London News*, and include biographies of eminent persons, in all walks of life, who have passed away since 1852. They are thoroughly readable papers, are marked by admirable analysis of character, are written with great felicity and care, and must be considered valuable contributions to our biographical literature.

The old readers of "Arnott's Physics," a book of science admirable in its time, will be glad to learn that the venerable Doctor still retains his interest in scientific education, and puts forth active efforts for its promotion. He has lately given ten thousand dollars to the University of London, the interest of which is to be bestowed as a reward for special proficiency in experimental physics.

A novelty in journalism is about to be issued in Jena, under the management of Professor Hallier. It will be devoted to the subject of vegetable and animal parasites, and is to be called the *Journal of Parasitology*. It will appear once every two months, and its communications are to be printed in the language of the author, so that French, English, Italian, and German papers may be expected in every number.

Accurate observations of the time of the transit of Venus across the sun's disk are of great importance in astronomy. This event occurs but twice in a century, and will next take place in 1882. The observations, to be of most use, must be taken near the high latitudes of the South Pole, which are difficult of access; while a winter's residence, for example, on the shores of South Victoria, would be a hazardous and terrible experience. Men of science are, nevertheless, already moving in the matter. The Royal Geographical Society of England has taken it up, and is determined to be in time in pressing upon Government the duty of sending an expedition to the Antarctic coast in 1882. It is agreed that a certain amount of training will be required of the officers and men to be sent, and, to make the enterprise a successful one, it is thought that thirteen years is none too little time for adequate preparation.

The starting-point of organic constructions is the chemistry of the leaf, by which carbonic acid is decomposed and oxygen set free. This effect has been supposed to take place only under the influence of light, but the conditions are not so clearly defined as to make further research unnecessary.

M. Bousingalt, of France, has made this subject a matter of investigation, and has lately presented the results of a new series of studies upon it. His question was, Does decomposition of carbonic acid, by leaves, take place in diffused light? If once commenced, does it go on in darkness? His mode of inquiry was based upon the fact that phosphorus does not shine in an atmosphere of carbonic acid, but becomes fluorescent as soon as a little oxygen is mixed with it. Having ascertained that phosphorus is not hurtful to plant when placed near them, he put leaves of laurel in a vase of carbonic acid, containing also phosphorus, and exposed it to the sun. Oxygen being liberated, the phosphorus becomes fluorescent. When the vase is placed in darkness, the fluorescence ceases, after a varying number of seconds, and lasts the longer the smaller the surface exposed by the phosphorus. This arises from the phosphorus requiring a certain time to absorb all the oxygen engendered in the last moments of exposure. With a sufficient surface of phosphorus the fluorescence ceases instantaneously, from which it is inferred that the process of liberating oxygen does not go on in the dark, but only when subjected to the motive force of light.

Researches on the solar atmosphere have been carried on by Frankland and Lockyer, of London. They have lately forwarded a letter to the French Academy on the "Constitution of the Sun," in which they admit of but a single solar atmosphere, and believe that its density is inferior to that of the terrestrial atmosphere. They explain this by the pressure being less. What else was contained in the communication, M. Dumas was unable say, as he could not make out Professor Frankland's handwriting. It is to be feared that Frankland has gone so deeply into the new chemical symbolism, that it has demoralized his chirography.]

### The Museum.

THE ingenuity of private enterprise in baffling governmental taxation upon trade is inexhaustible. At one period a great deal of lace was smuggled into France, from Belgium, by means of dogs trained for the purpose. A dog was caressed and petted at home, fed on the fat of the land, thence, after a season, sent across the frontier, where he was tied up, half starved, and ill treated. The skin of a bigger dog was then fitted to his body, and the intervening space filled with lace. The dog was then allowed to escape, and make his way home, where he was kindly welcomed with his contraband charge. The custom-house officials, at length getting scent of the practice, made an exterminating war upon the dogs; and, by offering a bounty of three francs apiece for their destruction, they got rid of 49,278 dogs from 1820 to 1886.

Perhaps one of the most delicious pieces of diplomatic affectation on record is the letter of introduction given by the Spanish sovereigns to Columbus, to be delivered to the potentates of the world he was going to discover. It runs as follows:

FERDINAND and ISABELLA to KING ———:

The sovereigns have heard that he and his subjects entertain great love for them and for Spain. They are, moreover, informed that he and his subjects very much wish to hear news from Spain, and send, therefore, their admiral, Ch. Columbus, who will tell them that they are in good health and perfect prosperity.

GRANADA, April 30, 1492.

The persecution of Quakers was not confined to New England; the old Virginia tobacco-planters were equally hostile to them. In a law of 1663 we find it enacted: "Every master of a ship, or vessel, that shall bring in any Quakers to reside here, after the first of July next, shall be fined five thousand pounds of tobacco." Again: "Any person inhabiting this country, and entertaining any Quaker in or near his house, to preach or teach, shall, for every time of such entertainment, be fined five thousand pounds of tobacco."

A singular custom prevails among the ancient families of Bretagne: a bride wears her lace-adorned dress but twice, once on her wedding-day, and only again at her death, when the corpse lies in state for a few hours before it is placed in the coffin. After the marriage ceremony the bride carefully folds away her dress in linen of the finest homespun, intended for her winding-sheet, and each year, on the anniversary of the wedding-day, fresh sprigs of lavender and rosemary are laid upon it until the day of mourning comes, when the white marriage-garment

leaves its resting-place, once more to deck the lifeless form of her who wore it in the hour of joy and hope.

Three hundred and twenty-five years have now elapsed since one of the earliest introductions to botany upon record was published in four pages, folio, by Leonhart Fuchs, a learned physician of Tübingen. At that period botany was nothing more than the art of distinguishing one plant from another, and of remembering the medical qualities, sometimes real, but more frequently imaginary, which experience, or error, or superstition, had ascribed to them. Little was known of vegetable physiology, nothing of vegetable anatomy, and even the art of arranging species systematically was still to be discovered. Botany was merely the gathering of herbs.—Dr. Lindley.

In Japan the bridegroom purchases his wife of the bride's parents, and is supposed not to have seen her till they meet at the hymeneal altar. The religious ceremony of marriage takes place in a temple. The pair, after listening to a lengthy harangue from one of the attendant priests, approach the holy altar, where large tapers are presented to them. The bride, instructed by the priest, lights her taper at the sacred censer, and the bridegroom, igniting his from hers, allows the two flames to combine and burn steadily together, thus symbolizing the perfect unity of the marriage state, and this completes the ceremony.

The art of starching, though known to the manufacturers of Flanders, did not reach England till 1564, when Queen Elizabeth first set up a coach. Her coachman, named Baernan, was a Dutchman; his wife understood the art of starching, a secret she seems exclusively to have possessed, and of which the queen availed herself.

### APPLETONS' JOURNAL

OF LITERATURE, SCIENCE, AND ART.

## GORHAM MANUFACTURING CO.,

PROVIDENCE, R. I.,

**STERLING SILVER WARE**

AND

**FINE ELECTRO-PLATED WARE.**

This Company, having the most extensive and complete Silver-Ware Factory in the world, and employing the best talent in designing, modelling, and finishing, are, with the aid of ingenious and labor-saving machinery, enabled to produce in large quantities, and at the lowest prices, goods beautiful in design and unsurpassed in finish, the fineness of which they guarantee to be of sterling purity, U. S. Mint assay. A certificate is issued with all articles in silver, for the purpose of protecting purchasers from imitations of their designs.

They also continue to manufacture their well-known and unrivalled Nickel-Silver Electro-Plated Ware, which will last twenty-five years with fair every-day usage.

Orders received from the Trade only, but these goods may be obtained from responsible dealers everywhere.

Trade Mark  
for  
STERLING. Silver.

Trade Mark  
for  
Electro-Plate.

EDITIONS IN BOTH FRENCH AND ENGLISH

WILL BE PUBLISHED APRIL 20th,

## SEA AND NIGHT;

BEING PART FIRST OF

VICTOR HUGO'S NEW NOVEL,

**THE MAN WHO LAUGHS;  
OR, BY THE KING'S COMMAND.**

VICTOR HUGO's remarkable novel will appear in several parts. The first, under the sub-title of "SEA AND NIGHT," will be issued on the day announced above. One Volume. 8vo. Paper cover. Price, 50 cents.

ON APRIL 15th, IN FRENCH,

## L'HOMME QUI RIT,

PAR VICTOR HUGO;

PREMIÈRE PARTIE, LA MER ET LA NUIT.

Un Volume. Broché. Prix, 50 cents.

Either Volume mailed, post-free, on receipt of price.

D. APPLETON & CO., Publishers, 90, 92 & 94 Grand St., N. Y.

## NEW YORK ILLUSTRATED.—No. 1.

## NEW YORK FROM THE SEA.

AS the steamer enters New York Bay from the sea, and sails between the villa-crowned shores of Staten and Long Islands, through that contracted passage known as the Narrows—the gate-way of our Western world, through which ceaselessly come and go the great ships and steamers, bearing flags of every nation, and connecting our waters with every sea—we observe on our left the massive battlements of Fort Richmond, or the water-battery of Fort Tompkins, at the lower verge of the Staten Island shore. Opposite, on Long Island shore, are similar formidable forts and batteries.

Passing amid these noble guardians of the entrance of our harbor, we see the great island-city of the Western hemisphere extending before our gaze. To the left is Bedloe's Island, a mere bank in the water, almost made for the convenience of the United States Government in the construction of a fort. Another island-fort, smaller and more insignificant, stands still farther toward the Jersey shore, and then well round the point of Governor's Island, stands old Fort Columbus, facing Castle Garden like a perpetual menace.

As we sail beyond the westerly point of Governor's Island, in our upward sweep to our North River pier, the entire splendor of the Empire City is spread before us like a dream. There are the crowd of sail upon the rivers, the puffing and busy tugs, the numerous ferry-boats, "the forest of

masts," the big ships, the mammoth steamboats, Trinity spire, looming up so nobly, the dome of the City Hall, the well-known Castle Garden, the crowded Brooklyn shores—all a brilliant and stirring panorama that few sights in the world can equal. At the extreme lower part of the island is

## THE BATTERY.

Most striking monument of respectability and beauty run to wretchedness and squalor, that can be found in any but the oldest countries, the Battery exists to-day an example of the changes

a few years will bring. Without going back to the old time, when it was a great grass-grown field, sprinkled with windmills and made homely with flocks and herds of pasturing sheep and cattle, men still in their prime can recollect it as the favorite promenade of the wealthiest and most fashionable class of the city. Hither came, on pleasant summer evenings, the fathers and mothers of the generation of to-day, for health, the fresh sea-breeze, flirtation, and enjoyment generally. They, in their unex-

panded thought, had more faith in it than their sons and daughters have in Central Park. They believed its plain stone wall and massive wooden railing were a monument of enterprise and engineering that could never be surpassed, and they were happy in their simple feeling, and content. Why, even fifteen years ago, there still remained an oasis of attraction for the votaries of art and fashion which may be

regarded as the last link connecting the tide that flowed up town with the extremity of the island. This link was Castle Garden. In its own name and that of the ground whereon it stood, it explained the military nature of its origin. In times when 20-inch Rodmans were unknown and a "long 32" was regarded as the noblest work of

artillerist genius, this unsightly old mass of circular masonry-work was the guardian sentinel upon Manhattan's bay-girt shores. After Castle Garden had smoothed its grim-visaged front of war and got rid of the iron bulldogs that grinned so menacingly from its embrasures, it went to the other extreme and gave itself up in a reckless manner

New York from Fort Richmond.

View of Castle Garden and Battery from the Bay

to the lascivious pleasing of the lute. In point of fact, it became a music-hall. Therein, after it had gone through divers minor vicissitudes, was triumphantly introduced to the American public the incomparable Jenny Lind. Therein Jullien, in November, 1853, gave us the first of his marvellous series of monster popular concerts. Even so late as the fall of 1854, Grisi and Mario and Susini made its ancient walls echo to their melodious strains, and, for the last time, brought, thronging by Bowling Green and the Washington Hotel, long lines of carriages of appreciative throngs of upper tenor. This was Castle Garden's closing glory. Within a few months it was transformed into an immigrant depot, and all its classic memories blotted out forever, except as they are held green in lingering memories. From this period forth the Battery degenerated with a velocity shocking to behold by citizens who had known it in its better days. It became a prey to the speculations of ruthless municipal officials and their friends, and rapidly sunk into the condition of a desolate and dissipated waste. A well-known public character obtained a contract to "fill in" the space between the old line of the Battery and the shoal just outside. He has been filling it for about twelve years, and the work seems as far from completion as ever. Instead of an addition to the space and beauty of the spot, it has been degraded to the level of a colossal dust-heap on one side and mouldering reminiscence of vegetation on the other. The

very trees have become infected with the demoralizing atmosphere of the place, and even those scarcely arrived at maturity show signs of speedy dissolution. The usefulness of the Castle Garden Emigrant Depot, as a means of shielding from extortion and violence the multitudes continually arriving here from

other countries, is the only redeeming feature of the place. That, at least, is an inestimable benefit to the most defenceless portion of the community.

### TRINITY CHURCH.

All New-Yorkers are proud of Trinity Church. The architecture is not the pure Gothic—so rarely attained—but the height of the steeple (two hundred and eighty-four feet), and its general architectural beauty and solidity redeem it from any slurs that may be thrown out by hypercritics. Moreover, there is hardly any thing pinchbeck in the entire structure. It is solid brown-stone, from foundation to spire, with the exception of the roof, which is wood. The walls of the church itself are fifty feet in height, and the whole edifice is generally recognized as one of the most elegant and cathedral-like on this continent. The graveyard of old Trinity occupies nearly two acres of ground (or it did so at one time), and within it are many venerated tombs.

Stop before this large but simple mausoleum. The winds and the rains of half a century have worn away a portion of the characters, and the thin moss which is generated from our eastern mists has cast its delicate greenness over the smooth marble; but, underneath, reposes the body of Alexander Hamilton, the friend of George Washington, and the victim of the memorable and unfortunate duel with Aaron Burr.

The tomb of Captain Lawrence, the hero of the "Chesapeake"—whose dying words, "Never give up the ship," will never perish from the English tongue—is close by the main entrance. It is looked upon by strangers in our city with the same interest that they go to see the weather-worn slab enclosing the skeleton of Benjamin Franklin, in Philadelphia.

The chief monument in the graveyard is that erected to the memory of the American patriots who died in British prisons while the city was under British rule. It is a very simple shaft of brown-stone, resembling the monumental crosses often found in European cities, and, in point of Gothic architecture, surpasses the church itself.

Besides these, there are many old gravestones, even within a few feet of Broadway, which are probably even more interesting to the strangers, gazing through that long line of iron railing, extending from Thames Street to Rector Street, on the west side of Broadway. Here, for instance, we have, in mouldering brown-stone lettering, the statement of the fact that "Susannah Gregory, the spouse of Jonas Gregory, died in the year 1787;" and, just beneath, despite the earth which the last rain has beaten up against the lettering, we make out (but very dimly) that the good-man Jonas followed his good-wife Susannah to the eternal rest, only two years afterward. "Thomas Wilkins, the infant son of Maria and Tobias Wilkins, aged one year three months," made a tombstone (almost illegible) for himself in 1766, when our fathers were toasting King George III. at their banquets, and before there was any idea of making a big teapot out of Boston Harbor. Next to this repose the last "mortal relics" of "George Van Krüser, slain while fighting in the War of Independence, in the year of our Lord 1781." Two lines of verse are under his name. Time has effaced them, but "George" probably sleeps as

Trinity Church and Martyrs' Monument.

soundly as if they glinted out brightly and broadly to every Broadway loungers who cares to pause and muse over these time-honored, time-stained monuments of the past.

The chimes of Old Trinity are surpassed by very few bells in the world. On all holidays the operator peals forth the most delightful music, his selections including patriotic as well as religious airs. The chimes are, indeed, considered so important that their programme for the next day is usually reported in the daily papers.

Trinity itself is the oldest church in the city. The first edifice was destroyed by fire in 1776, and was rebuilt in 1790. It was afterward (in 1839) pulled down. The present noble structure was finished and consecrated in 1846.

The view from the lookout in Trinity tower is the finest that can be afforded in the city of New York.

The view extends from the Highlands of New Jersey (and, in clear weather, from Sandy Hook), far up into the Palisades, and up among the picturesque islands that throng the throat of Long Island Sound. The perquisite received by the sexton is merely nominal, and no stranger should quit the metropolis without making this famous ascent.

In all the old churches of New York the plan of a collegiate charge was the rule. Trinity Church was considered the parish church, and, therefore, had a collegiate charge. St. John's, St. George's, and St. Paul's were considered "chapels" merely.

#### THE CUSTOM-HOUSE.

Once this building was known as the Merchants' Exchange. Then it was famous for the great granite plinths of the columns that supported the pediment of the front elevation. They should be as famous still. Massive cylindrical blocks such as these, fluted and otherwise cut from the most unyielding of stones, are a triumph of masonry.

This present Custom-House occupies the irregular square between Wall Street, Exchange Place, William Street, and Hanover Street. Scarcely any thing but stone was employed in its construction. Mr. Isaiah Rogers was the architect, to whom the city is indebted for this really splendid piece of architecture. It is splendid because of its insured stability; and yet, great as its dimensions are, it only cost about \$1,800,000. These dimensions are a depth of 200 feet, a frontage of 144 feet, and a rear breadth of 171 feet. Its height to the top of

the central dome is 124 feet. Beneath this dome, in the interior of the building, is the Rotunda, around the sides of which are eight lofty columns of Italian marble, the superb Corinthian capitals of which were carved in Italy. They support the base of the dome, and are probably the largest and noblest marble columns in the country.

Here in this spacious and lofty apartment are gathered the principal officers of the Custom-House, and a busy crowd of merchants and clerks ceaselessly flows in and out of its ample doors. No building in our city is better worth a visit from strangers.

The fact that the original stockholders in the building, whereof this is the successor, lost every cent they had invested, has never interfered with the satisfaction felt by the present owners of stock in the concern at the profitable use they have made of the later shares they were fortunate enough to own.

Custom-House.

#### THE UNITED STATES TREASURY AND ASSAY OFFICE.

This white-marble building, on the corner of Wall and Nassau Streets, was constructed for and long used as the Custom-House of the port of New York. The Custom-House has been removed to the more commodious quarters

afforded by the premises formerly known as the Merchants' Exchange, and Uncle Sam has located one of his chief financial offices here instead. The building is a handsome and imposing one, and would be a fine specimen of the Doric order of architecture, had it not been disfigured by unseemly accessories that mar the simplicity of the design. It is 200 feet long, 80 feet wide, and 80 feet high. The main entrance on Wall Street is made by a flight of eighteen marble steps, while on Pine Street, in the rear, the acclivity of the ground brings the entrance almost on a

Treasury Building, and Wall Street looking West.

level with the street. The old Federal Hall used to stand on this same site, and the spot is rendered classic from its being that whereon Washington delivered his inaugural address.

#### NASSAU STREET, LOOKING NORTH FROM WALL.

A wonderfully busy street—a street noisy and full of life, as it is narrow and destitute of facilities for the incessant stream of traffic that rushes through it. Just here is where one sees the pressure on it

Nassau Street, North from Wall Street.

most. The Nicolson pavement is, with all its faults, an immense improvement on the noisy Belgian and other experiments that have been tried here. It affords peace and quiet to the money-changers in such temples of finance as those of Jay Cooke & Co., Fisk & Hatch, Duncan & Sherman, the Bank of Commerce, and others that line each side of the thoroughfare. The view is virtually closed by the Post-office, and of that it is better not to give any description.

#### THE TOMBS.

It has not been recorded who first gave the City Prison and Criminal Court-House its expressive name; but infractors of the laws, who are sent to stay there are, undoubtedly, for the term of their confinement, virtually buried. They are dead to the world, so long as they remain there; and is there not, cast over them all, the shadow of that hideous emblem of the grim destroyer—the gallows? Those who have never visited the various departments of the Tombs, can have but a faint idea of the depravity of human nature, or the wonderful process of “case-hardening” through which a statistical average of the community seem to inevitably go. Of course, there are always prisoners within its fastnesses who command a share of sympathy; some of whom are really innocent and have no business there at all, and others under sentence for a first offence—but the majority are more wicked than the reputable orders of society can well imagine, and really seldom meet with one tithe of the punishment they deserve. Every one who has seen the Tombs knows what a parody upon a Memphian or Theban temple it appears. The waste of space in its construction is a marvel of misdirected architectural skill; yet there is a certain individuality about its heavy, squat, and general solid character that commands attention; while the elevation on Centre Street, with its overwhelming portico and pediment, and depressing area of dismal quadrangle, is a masterpiece of what genius may accomplish in the way of gratuitous gloom. Crime comes to preliminary judgment here in a room on the right-hand side as you enter. This is the Tombs Police Court,

where, as early as six or seven o'clock each morning, a district justice takes his seat upon the bench to hear what charges may be brought before him, and decide what shall be done with the prisoners. In minor cases such as drunkenness, disorderly conduct, or vagrancy, this magistrate can order summary fine, commitment, or discharge, at his discretion. Commitments are made to the jurisdiction of several higher courts, but the only one of these in the Tombs building is the Court of Special Sessions. Two justices are supposed to sit together there, and they have to deal with such matters as petty larceny, assault and battery, and certain forms of common misdemeanor. Every Tuesday, Thursday, and Saturday, they strive to be a terror to evil-doers and a praise to them that do well. As a general thing, experience has rendered them amazingly successful in this endeavor. They have known the dangerous classes so long and intimately, as to enable them, except when influenced by political interest, to be eminently discerning and impartial. A great many culprits go from this court to the cells in the interior of the Tombs. More, however, come there from the Court of General Sessions and the criminal side of the higher courts. The interior arrangements of the jail proper do not materially differ from those usually found in institutions of the kind, though many improvements might be made in the accommodations, especially in the matter of ventilation. The lack of room necessitates the crowding of prisoners together, a practice which does not work favorably on the morals of the less vicious. There are eleven cells of special strength and security, in which are convicts sentenced to death, or a life worse than death in the State prison; six others, wherein are locked up those guilty of less heinous crimes; and six more, used for hospital purposes. There are sixty more cells on the two upper tiers, for those convicted of various degrees of felony. These are on the male side. On the female side are twenty-two cells, and one-half of these are used as temporary receptacles of such cases as go no farther than the Police Court or Special Sessions. Each prisoner costs

the county an average of about thirty cents a day for his board. The inner quadrangle, formed by the series of cellular structures, is where the last penalty of the law is put in execution. Except at the moment when that penalty is enforced, there is nothing impressive or remarkable in its appearance. Still, any one, acquainted with the associations belonging to its sombre monotony of gray stone walls and narrow gratings, feels a vague, disagreeable sense of awe as he hears his own footsteps echo in hollow reverberation from its corners.

The Tombs.

### THE EQUITABLE LIFE ASSURANCE COMPANY.

The Equitable Company, judging from the character of its new building, evidently intends to last for several centuries. It may be said safely, and without invidiousness, that there is no other structure in New York so solid and substantial. The architectural design is not entirely pure, but is useful and effective. Doric is the pattern of the lower stories, composite of those immediately above, and the upper part is finished in the *renaissance* or *Mansard* roof style. What is lacking in correctness is made up in picturesque boldness of scenic outline, and few edifices on Broadway will be apt to attract more attention. The entire building has a frontage of 87 feet on Broadway, is 187 feet deep on Cedar Street, and will be 137 feet high.

### HERALD BUILDING, ETC., BROADWAY.

The unfortunate Loew Bridge, which name was given to the unsightly structure that not long ago spanned Broadway at the intersection of Fulton Street, although considered a nuisance, afforded strangers an opportunity of witnessing one of the finest and busiest thoroughfares in the world, which cannot be obtained again for some years to come. It was generally shunned by citizens themselves, who would rather brave the perils of the roaring street, in among the wheels and horses' legs, than make its steep and laborious ascent, but the view from above was one well worth taking. Looking down Batteryward, there were to be seen the magnificent rows of elegant buildings stretching on either side of the way from the lower side of Fulton Street to Bowling Green, whose ancient fountain (we may call it so in this country) is just seen peeping up above the decline of the grand artery as it sweeps down to the Battery, with one current to the right, and closing at the old "Washington Headquarters," whose uppermost white story just glimmers above the hill; and the other side of the tide sweeping toward South Ferry, with a hundred stages and a dozen express-wagons navigating the difficult passages of the street.

Turn to the other side of the departed bridge, and the scene is

Corner Cedar Street and Broadway.

even more diversified and tumultuous. On the left is old St. Paul's, with its graveyard containing tombstones bearing dates as old as those in the grounds of Old Trinity, farther down; and on the right the *Herald* Building, and the splendid structure recently erected by the Park Bank.

The incidents connected with the erection of the former building are well known and interesting. The inception of the new *Herald* Building was coincident with the destruction, by fire, of Barnum's famous Museum in the summer of 1865. It created great excitement at the time. According to the imaginative reports of the daily press—especially the one proceeding from the *Tribune*—the stuffed wild beasts, dried alligators, preserved whales, and other inert specimens of natural history, were made to play a most extraordinary part for the amusement of the readers of the land, and, in some cases, we are

sorry to state, for their deception. The result was the purchase of the ground by Mr. Bennett from Mr. Barnum, in which occurred a singular misunderstanding between the parties, leading to an estrangement which afterward provoked the famous rupture between the proprietor of the *Herald* and the theatrical managers, now happily terminated.

The Park Bank—the next building southward—is one of the most showy, if not the finest in an architectural point of view, in the city of New York. It has been erected at an immense expense, and is one of the most attractive features of Broadway. At all times crowds of people pause by the railing of St. Paul's, to stare up at its elaborate and massive marble front, its colossal figures, and its columns and pediments. It is likely for a long time to rank as an architectural boast of the metropolis.

The Astor House on the left, glancing northward, is

Broadway at lower end of the Park.

also of interest. In addition to its being one of the first-class hotels of the city, it has long been the favorite resort of army and navy men. Grant, Hooker, Farragut, Porter, and many of the rest who have recently placed their names high upon the muster-roll of fame, were wont to make this their favorite hotel when visiting the metropolis; and, it formerly was the scene of more distinguished "receptions" and entertainments than any other establishment of the kind in New York.

Our artist, in the scene delineated, has chosen probably the most animated portion of Broadway. The new *Herald* and Park Bank buildings as central objects; St. Paul's, in dark relief, to the right; the multitude of vehicles jostling their crowded way up and down the street; the wayfarers eagerly waiting for their opportunity to pass, without peril, through the press—the picture will be readily recognized and appreciated.

*BROADWAY, LOOKING NORTH FROM THE ST. NICHOLAS.*

The vista is a long, and, in its way, a strikingly picturesque one. Taking the splendid façade of the St. Nicholas Hotel itself as a starting-point, the eye gathers in on either side a range of business palaces that are not equalled for display in any other city of the world. The tall and graceful spire of Grace Church closes the view, for, at that point, Broadway makes the bend due north which leads it

to the Harlem drives. Marble and brown-stone variegates the tints that meet the eye with charming contrast, and the gradations of color thus given, lighted by clear sunlight, become

Broadway, looking North from the St Nicholas.

an actual presentment of effects for which the imagination of the artist might dream in vain. The actuality of incessant bustle, and even some idea of the accompanying buzz and roar, are conveyed in the picture of the scene herewith presented. The tide of stage and hack traffic; the episodal gleams of brilliant private equipages; the gay throngs of promenaders—all appear as if fresh from a sketch of one who could be both close and comprehensive in an effort at conscientious observation. A walk on Broadway has always been a perennial pleasure to the men and women of New York, and a great delight to strangers. It is related that Charles Dickens, when he first visited this country, would spend hours at his window at the hotel, watching the ever-changing tide of equipages and pedestrians. Thackeray, when here, also keenly appreciated the stir and bustle of this brilliant promenade, and was never tired of walking its pavements, and watching, with his keen, searching eye the ceaseless procession of human faces. He always pronounced it the finest street in the world. "Let us walk down Fleet Street, sir," old Dr. Johnson was wont to say, when seeking relaxation from his literary labors, or an escape from his melancholy. How the old city-loving Doctor, with his fondness for busy highways, and his hatred of the solitudes of the country, would have delighted in such a street as Broadway! To a man of his temperament, it would afford an endless means of pleasure.

There are other streets in New York that have as fine buildings, and in general symmetry of effect are even handsomer. There are also as handsome shops in other cities. For short distances, Chestnut Street, Philadelphia, Washington Street, Boston, and Lake Street, Chicago, almost rival Broadway in animation and gayety. But the handsome architecture of Broadway, and its bustle and life, extend for over three miles, and this is its superiority. There is continual change, and yet unbroken continuity of effect. If you begin your walk at the Battery, you first find shipping-offices, express-offices, and some of the heavier forms of merchandise. The street is full of omnibuses and trucks. The sidewalks are crowded with hurrying business people. When you reach above Wall Street, you enter the

domain of the banks, the insurance-offices, and the lawyers. Architecturally this is probably the handsomest part of the street. Above the Park you enter among the jobbers, and find the street lined with their stately warehouses. So far you have seen no mere promenaders, only a rushing crowd of people intent on business, with here and there a woman. As you cross Canal Street you come among the retailers, with their gay shop-windows, and the big hotels, the theatres, and an infinite variety of indescribabilities; and now there is more elegance on the sidewalks. Well-dressed idlers begin to abound. Ladies are more frequent, and their handsome toilets give relief to the tide of dark-coated men. As you ascend, the shops get handsomer; and, by the time you reach Tenth Street, you find an utter change in all the aspects of the street. This point is the ladies' shopping-ground. Carriages are in possession of the roadway, and throngs of women in elegant costumes flock in and out of the shops. The scene is one of the brightest and gayest conceivable.

## FIFTH AVENUE.

Still the handsomest street in New York, though of late years losing its tone to some extent, Fifth Avenue must be cherished by native denizens, and presented to strangers as the best thing our opulence

and taste have yet been able to achieve in the line of continuously impressive architectural display. On many other streets—not mentioning Broadway—there are more elegant buildings and even more imposing private residences; but the *ensemble* of Fifth Avenue is still unrivalled. Commencing at Washington Square, its luxury and splendor have extended nearly to Central Park, until what was thought a one-mile marvel of experiment in 1854, has become a miracle of accomplishment in half a generation later. While exclusive circles have chosen more retired locations wherein to erect palatial places of abode, Fifth Avenue has consistently

represented the rage for lavish expenditure which characterizes the newly-rich, while with this class still remains mingled a considerable leaven of those who give the uppermost stratum of "society" its laws. To describe in detail the many splendid mansions that line either side of it would be to destroy the general effect and pleasure of a first impression with those who have never travelled through its long extent of scarcely interrupted magnificence. It has become a type of the promiscuous shades of social quality which somehow inevitably come together—often in a manner most incongruous—in a great city like the metropolis. It has been invaded between Twelfth and Twenty-third Streets by the aggressive influences of trade. First-class stores have been constructed out of brown-stone

palaces, and dry goods, millinery, tailoring, restaurants, and music-stores are beginning to intrude upon the precincts once sacred to aristocracy and exclusiveness. There have been incursions, too, from less reputable hordes of outside barbarians. Where merchants of high standing with their families once lived, the "tiger" that

men nightly fight with ivory chips has made his lair. Faro flourishes and keno reigns supreme where fireside felicity once shed a homely lustre. And even worse than this; but that is bad enough for mention here. On one plebeian corner of the avenue, for a long time there persistently existed a painter's shop, which seemed to

scorn all temptations looking to removal. Counterbalancing, however, what is evil of these intrusions, are a number of the most attractive sacred edifices in the city. Mostly built of brown-stone in cosy, half Gothic or Elizabethan style, with shaven lawns around and bowered by the most luxurious of foliage, these places of worship are really charming in appearance. But the special beauty of Fifth Avenue is its spacious sidewalks in the fashionable season, especially on a Sunday morning that's bright and sunny. The time will be immediately subsequent to morning service. The scene may be scarcely appropriate, following so soon upon the re-

ligious exercises that have preceded it, but it is very fascinating in its freaks of worldly frivolity. What of loveliness and brilliancy in female face and form and frippery of dress that passes for two hours in a kaleidoscopic panorama, could not help but dazzle the most stoical of spectators. Nothing to compare with it can be seen elsewhere, at

any time, in any part of the world. There is another phase of life on the upper end of the avenue, which has an equal fascination for a large class of people. This is the display of splendid equipages which congregate there on the road to Central Park. All that luxury and wealth, directed by good judgment, can procure in the way of first-class horse-flesh, and a superb variety of carriages, throng briskly or sedately onward, as the fancy

dictates, and form a different panorama as matchless in its way as that upon the sidewalks lower down. Of all the splendid buildings on Fifth Avenue, none will probably ever be so famous as the marble palace for Mr. A. T. Stewart, just completed at the corner of Thirty-fourth Street. This will unquestionably be, when completed, the most costly

Fifth Avenue, at Corner of Twenty-first Street.

Mr. A. T. Stewart's Residence, Corner of Fifth Avenue and Thirty-fourth Street.

and luxurious private residence on the continent. Even in its present unfinished state, words are almost inadequate to describe the beauty and unique grandeur of some of the details of its construction. Mr. Stewart hopes to have it ready for occupation by next fall. Before he enters it as a tenant it will have cost him nearly three millions of dollars.

The marble-work, which forms the most distinguishing characteristic of this palatial abode, receives its entire shape and finish in the basement and first floor of the building. The fluted columns (purely Corinthian, and with capitals elaborately and delicately carved), which are the most striking feature of the main hall, are alone worth between three thousand five hundred and four thousand dollars. On the right of this noble passage, as you proceed north from the side entrance, are the reception and drawing rooms, and the breakfast and dining rooms, all with marble finish, and with open doors, affording space for as splendid a promenade, or ball, as could be furnished, probably, by any private residence in Europe.

To the left of the grand hall are the marble staircase and the picture-gallery—the latter about seventy-two by thirty-six feet, lofty and elegant, and singularly well designed. The sleeping-apartments above are executed upon a scale equally luxurious and regardless of expense. Externally, the building must ever remain a monument of the splendor which, as far as opulence is concerned, places some of our merchants on a footing almost with royalty itself, and a glance at the interior will be a privilege eagerly sought by the visiting stranger.

Fifth Avenue, beginning at Washington Park on Waverley Place,

terminates somewhere in the wilderness at the upper end of the island. At Fifty-ninth Street is the lower end of the Central Park, this avenue forming the eastern boundary of that famous pleasure-ground. From Waverley Place to Fifty-ninth Street is a stretch of two miles and a half, the entire length of which, with the exception of a few squares, just below the Park, is one uninterrupted succession of costly and imposing mansions. All the streets that cross it are known by numerals. The squares each side of the avenue, for its entire length, partake of the exclusive character of the Avenue itself, affording a space over two miles long and about a third of a mile wide, in which elegance and wealth reign almost supreme. There are many noble residences elsewhere in the city, but we nowhere find so extensive and unbroken a phalanx of brown-stone supremacy.

The Avenue, excepting when filled with promenaders, is almost solemn with its massive wealth. But we must peep within the palaces if we would comprehend the full extent of their splendor. Their lavish adornment is a marvel even to travelled eyes. It is known that bronzes, pictures, vases, rare and costly furniture, and articles of ~~art~~ generally, have one of their best markets in New York. Through the plate-glass windows the promenader may occasionally catch a glimpse of the interior elegance—flowers, vases, gilded furniture, pictures, frescoed walls, and rich upholstery. Above Fifty-ninth Street, the Avenue is, so far, very little built upon; but the lots are held at extravagantly high prices, and it cannot be doubted that ere long all this portion of the street, overlooking Central Park, will be built up with a succession of elegant villas and mansions.

Fifth Avenue on a Sunday Morning.

## THE MAN WHO LAUGHS; OR, BY THE KING'S COMMAND.

BY VICTOR HUGO.

### BOOK III.—THE CHILD AND THE NIGHT.

#### I.—CHESS-HILL.

THE storm was no less severe on land than at sea.

The same ferocious unchaining had taken place around the child who was abandoned. The feeble and the innocent become what they may, when blind forces expend their unconscionable anger. The shadow has no discernment; and objects have not the clemency attributed to them.

There was very little wind on shore. The cold was indescribably motionless. No hailstones. The thickness of the falling snow was fearful. Hailstones strike, harass, bruise, deafen, crush; flakes are worse. Inexorable and soft, the flake does its work in silence. If you touch it, it melts. It is pure, as the hypocrite is candid. It is by whitenesses heaped up, that the flake arrives at the avalanche, and the knave at crime.

The boy had continued to advance in the fog. The fog is a pulpy obstacle; thence its perils. It yields, and persists. Fog, like snow, is full of treachery. The child, strange struggler in the midst of all these risks, had succeeded in reaching the foot of the descent, and had entered upon Chess-Hill. He was, though not aware of it, upon an isthmus, having the ocean on two sides, and unable to make a false step, in this mist, this snow, this obscurity, without falling, on his right, into the deep water of the bay; on his left, into the raging waves of the high sea. He walked, ignorant, between two abysses.

The isthmus of Portland was at this period singularly rough and rude. It retains nothing now of its configuration then. Since the idea has obtained of working Portland stone into Roman cement, the whole rock has undergone a remodelling, that has done away with its primitive look. You may still find there calcareous lias, schist, and trap, growing out of banks of conglomerate, as the tooth out of the gum; but the pickaxe has broken up and levelled all those shaggy and rough peaks, whereon the ospreys would make their frightful perch. There are no more heights whereon might rendezvous the foul birds that romit and the stercorary tribe, which, like the envious, are addicted to defiling high places. One may gather still, in summer,

upon this ground, which is perforated and in holes like a sponge, rosemary, pennyroyal, wild hyssop, sea-fennel, which, infused, makes a good cordial, and that herb, full of knots, that grows out of the sand, and is used for matting; but no more ambergris is picked up there, nor black tin, nor that triple kind of slate, partly green, partly blue, partly of the color of sage-leaves. The foxes, the badgers, the otters, the martens, have disappeared. There were formerly chamois in these Portland ridges, as at the farther point of Cornwall; but they are no longer there. There is fishing still, in certain hollows, for plaice and pilchard; but the salmon, scared away, no longer ascend the Wey between Saint Michel and Noal, to deposit their spawn. One sees no more, as in the time of Elizabeth, those old and unknown birds, as large as hawks, that split an apple in halves and only eat the pips. One sees no more of those rooks, Cornish choughs in English, *Pyrrhocorax* in Latin, which were malicious enough to let fall lighted vine-twigs upon roofs of thatch. One sees no more that winged sorcerer, the pétrel, an emigrant from the Scottish archipelago, that ejected an oil from his beak, which the islanders burned in their lamps. One meets no more, in the evening, in the swashes of the ebb, the old legendary *neitae*, with feet of pig and bleat of calf. The tide no longer throws upon these sands the mustached seal, with twisted ears and pointed grinders, dragging himself upon nailless paws. In this Portland, not to be recognized in our day, there have never been nightingales, because there were no forests; but the falcons, the swans, and the sea-geese have flown away. The Portland sheep of the present time are fat in flesh and fine in wool; the few sheep that fed, two centuries ago, upon this salted grass, were small and tough, and had rough fleeces, as became the Celtic flocks, once tended by garlic-eating shepherds, who lived a hundred years, and who, at half a mile distance, could pierce through breastplates with their arrows an ell in length. Uncultured land makes poor wool. The Chess-Hill of to-day in no respect resembles the Chess-Hill of other times, so much has it been overturned by man, and by those furious winds from the Scilly Isles that eat into the very stones.

To-day, this tongue of land has its railway, that leads to a pretty checker-work of houses, called Chesilton; and there is a Portland station. Trains roll along, where sea-calves crawled.

The isthmus of Portland, two hundred years ago, was an ass's back, of sand, with a vertebral spine of rock.

The danger had changed in form. What the boy had to fear in the descent was rolling to the bottom of the ridge; on the isthmus, it was tumbling into the holes. Having had to deal with the precipice, he had to deal with the quagmire. Every thing is a trap, on the borders of the sea. The rock

\* Entered, according to Act of Congress, in the year 1869, by D. APPLETON & CO., in the Clerk's Office of the District Court of the United States for the Southern District of New York.

is slippery; the sandy strand is moving. The points of support are ambushes. You are like a person who puts his foot upon panes of glass. All may suddenly crack beneath you; a crack, through which you may disappear. The ocean has its triple under-ground, like a theatre well found in machinery.

The long ridges of granite, on which the double declivity of an isthmus leans, are difficult to tread. You are troubled to find what is called, in setting scenes for the stage, the practicable. Man has no hospitality to expect from the ocean; no more from the rock than from the wave. The bird and the fish are alone provided for by the sea. Isthmuses particularly are bare and jagged. The flood, that uses up and undermines them on either side, reduces them to their most simple expression. Everywhere, sharp prominences, crests, serrated edges, frightful tatters of broken stone, yawnings toothed like the much-indurated jaw of the shark, breaknecks of saturated moss, rapid slopes of rock leading into the foam. He who undertakes to traverse an isthmus, encounters at every step shapeless blocks as large as houses, figuring shin-bones, shoulder-blades, thigh-bones, a hideous anatomy of crags that are flayed. It is not for nothing that these striates of the borders of the sea are called ribs. The pedestrian draws himself as best he may out of this pell-mell of rubbish. To find a way across the system of bones in a gigantic carcass—such is almost his work.

Put a child at this labor of Hercules!

Broad daylight might have been useful; it was night. A guide would have been necessary; he was alone. In lack of a guide a path would have aided him. There was no path.

By instinct, he avoided the rows of jagged points in the rock, and followed the strand as much as he could. It was there that he encountered the quagmires. The quagmires multiplied themselves before him in three forms—the quagmire of water, the quagmire of snow, the quagmire of sand. The last is the most formidable. It swallows one up inextricably.

To know what one affronts is alarming; but to be ignorant of it is terrible. The child combated the unknown danger. He was groping his way in something that was, perchance, a tomb.

No hesitation. He turned the rocks, avoided the crevasses, divined the pitfalls, submitted to the meanderings of obstacle; but he advanced. Unable to proceed straight on, he walked steadily.

He recoiled, at need, with promptness. He knew how to snatch himself in time from the hideous glue of moving sands. He shook off the snow that fell on him. He went into water, more than once, up to his knees. When he got out of it, his wet clothes were frozen all at once by the bitter cold of the night. He walked rapidly in his stiffened garments. He had, however, had the wit to keep dry and warm over his breast his sailor's reefing-jacket. He was, all the time, very hungry.

The accidents of the abyss are in no sense limited; all is possible therein, even safety. The issue is invisible; but it may be found. How did the boy—enveloped in a stifling whirl of snow, lost on that narrow causeway between the two open jaws of the gulf, and unable to see—contrive to traverse the isthmus? This is what he could not himself have told. He had slipped, clambered, rolled, sought, walked, persevered—that is the whole of it. The secret of all triumphs. At the end of a little less than an hour, he felt that the soil was on the ascent; he reached the other side; he got out of Chess-Hill; he was upon firm ground.

The bridge which, to-day, unites Sandford-Cas to Small-mouth Sand, had no existence at that period. It is probable that, in his intelligent groping, he had remounted so far as to be opposite Wyke Pregis, where he then had a tongue of sand, a true natural causeway traversing the East Fleet.

He was saved from the isthmus, but he found himself again face to face with the storm, with the winter, with the night.

Before him was developed anew the sombre uncertainty of plains.

He looked to the ground, searching for a path.

All at once he stooped down.

He saw something on the ground, that seemed to him a trace.

It was, in fact, a trace, the mark of a foot. The whiteness of the snow cut clear the impression, and made it very distinct. He studied it. It was the print of a naked foot, smaller than a man's, larger than a child's.

Probably a woman's foot.

Beyond this footmark there was another, then another. The prints were successive, a step apart, and went far on in the plains toward the right hand. They were still fresh, and but slightly covered with snow. A woman had just passed along.

This woman had been walking, and had gone in the direction where the boy had seen smoke.

The child, his eyes fixed upon the imprints, set himself to follow them out.

## II.

### EFFECT OF SNOW.

HE went on, a certain time, upon this track. Unfortunately, the traces became less and less distinct. The snow was falling thick and fearful. It was the moment when the ork, under this same snow-storm, was agonizing on the high-sea.

The boy, in distress like the vessel, but of another kind, having—in the inextricable intercrossings of the darkness that rose before him—no other resource than the footstep marked in the snow, clung to it, as to the thread of a labyrinth.

Suddenly, either because the snow had at last effaced them, or from some other cause, the footprints ceased. All became smooth, level, of a piece, without spot or variation. There was nothing now but a white covering on the earth and a black covering on the sky.

It was as if the woman who passed had flown away.

The child at bay stooped and sought. In vain. As he rose, he had a sensation of something indistinct which he heard without being sure of hearing. It was like a breath, or the shadow of a voice. It was human rather than bestial, and sepulchral rather than living. It was a noise, but the noise of a dream.

He looked and saw nothing.

The vast solitude was before him, naked and livid.

He listened. What he thought he had heard was lost. Perhaps he had heard nothing. He listened again. Silence everywhere.

The mist was full of delusion. So he started again. Started at random, having no longer this footstep to guide him.

He had scarcely moved when the noise recommenced. This time he could not doubt. It was a groaning, almost a sob.

He turned. His eyes ran over the darkness. He saw nothing.

The noise rose again.

If the souls in prison can cry, they cry thus.

Nothing so penetrating and poignant, and yet so weak, as this voice. For voice it was. It came from a soul. There was the tremor of life in that murmur. And yet it seemed almost unconscious. It was something like a suffering that appealed, but without knowing that it was a suffering and that it made an appeal. This noise, first breath or last sigh as it might be, was equally removed from the death-rattle which closes life and the wail which ushers it in. It breathed, it choked, it wept. Dim supplication in the invisible.

The boy examined attentively everywhere, far and near, high and low. Nobody. Nothing.

He listened. The voice was heard again. He perceived it distinctly. It was something like the bleating of a lamb.

Then he was frightened and thought of fleeing. The groaning began again for the fourth time. It was curiously wretched and plaintive. One felt that after this last effort, more mechanical than voluntary, the cry would probably die out. It was as

expiring call, instinctively addressed to whatever succor might be floating in the universe; a vague stammer of agony, directed to a possible Providence. The child advanced in the direction of the voice. Still he saw nothing.

But he kept on, looking round sharply. The complaint continued. Before, inarticulate and confused, it had now become clear and almost shrill. The child was close to the voice. But where was it?

He was near a complaint. As it trembled into space, it passed alongside him. A human groan floating in the invisible, that was what he had met. At least such was his impression, dim as the fog in which he was lost.

As he hesitated between an instinct impelling him to fly, and an instinct telling him to stay, he saw, in the snow at his feet, some steps before him, a protuberance, the size of a human figure, a small elevation, low, long, and narrow, at the side of a crevice, like a sepulchre in a white cemetery.

At the same moment the voice sounded.

It came thence.

The child stooped, squatted down before the object, and began to clear it away with both hands.

Under the snow which he was removing, the outlines of a form disclosed themselves, and suddenly beneath his hands, in the hollow which he had made, appeared a pale face.

It was not this face that cried. Its eyes were shut and its mouth open, but full of snow.

It was motionless. It stirred not under the child's hand. Though his fingers were numb with frost, he started on touching the cold of this face. It was a woman's head. The dishevelled locks were mixed up with the snow. The woman was dead.

The child went to work again at removing the snow. He liberated the dead woman's elbow, then the upper part of the trunk, the flesh of which was visible under its rags.

Suddenly he felt under his groping touch a slight motion. It was some small thing, wrapped up and stirring. The boy removed the snow briskly, and discovered a wretched abortion of a body, puny, wan with cold, but still alive, naked on the dead woman's naked bosom.

It was a little girl.

She was swaddled, but imperfectly, and had struggled herself out of her rags. Her poor thin limbs under her, and her breath above her, had slightly melted the snow. A nurse would have given her five or six months, but she might have been a year old, for growth in poverty undergoes heart-rending diminutions, which sometimes end in rickets. When her face was exposed to the air she uttered a cry, the continuation of her sob of distress. The mother must have been very dead, not to have heard that sob.

The boy took the little girl in his arms.

The mother, stiff in death, had a sinister aspect. A spectral radiation emanated from her face. Her mouth, gaping and void of breath, seemed beginning, in the doubtful language of the shades, an answer to the questions put to the dead in the invisible world. There was a wan reflection of the frozen plains on this face. One might see the forehead under the brown locks which showed its youth, the almost angry knitting of the brows, the closed nostrils, the shut lids, the eyelashes glued together by the hoar-frost, and, from the corner of the eyes to the corner of the lips, the deep channel of tears. The snow lighted up the corpse. Winter and the tomb do each other no harm. The carcass is the icicle of the man. The nakedness of the breasts was pathetic. They had done their work; they bore the sublime impress of life given by a being whose own life is failing; in them maternal majesty replaced virgin purity. At the extremity of one of the nipples hung a white pearl. It was a frozen drop of milk.

Let us say at once, that a few hours before, a beggar-woman with her sucking-child, she also seeking a lair, had lost herself in these plains where the lost boy was now passing in his turn.

Benumbed, she had fallen under the storm and had been unable to raise herself again. The snow-drift had whelmed her. She had pressed her daughter as close to her bosom as she could, and died.

The little girl had tried to suck the marble body. Dark trust implanted by Nature, for it seems as if a mother might give suck for the last time, even after her last sigh.

But either the child's mouth could not find the nipple, or the drop of milk, stolen by Death, had frozen, and the suckling, more used to the cradle than to the tomb, had cried out.

The little deserted boy had heard the little dying girl.

He had dug her up.

He had taken her in his arms.

When the little girl felt herself in some one's arms, she stopped crying. The faces of the two children touched, and the blue lips of the suckling felt for the boy's cheek as if it was a breast.

She had almost reached the moment when the congealed blood stops the heart. The mother had communicated to her somewhat of her own death. A corpse is catching, it is a chill that spreads. Her feet and her hands, her arms and her knees, were almost paralyzed by the frost. The boy perceived this terrible coldness.

He had on a dry and warm garment, his woollen jacket. He laid the suckling on the breast of the corpse, took off his jacket, wrapped the child in it, lifted her up again, and, now almost naked to the puffs of snow which the gale blew, started again, carrying the little one in his arms.

The girl having succeeded in finding the boy's cheek again, pressed her mouth to it, and recovering her warmth fell asleep. First kiss of these two souls in the darkness.

The mother remained lying there, her back on the snow, her face to the night. But at the moment when the little boy stripped himself to clothe the little girl, perhaps from the depths of infinity where she was, that mother saw him.

### III.

#### EVERY SAD WAY HAS ITS EXTRA BURDEN.

RATHER more than four hours had passed since the ork departed from Portland Creek, leaving this boy on the shore. During those long hours since he was abandoned, during all this time that he had been walking on, he had met, in the human society which he was perhaps about to enter, but three persons, a man, a woman, and a child. A man, that man on the hill; a woman, that woman in the snow; a child, this little girl whom he held in his arms.

He was worn out with fatigue and hunger. With less strength and an additional burden, he advanced more resolutely than ever.

He was now almost without clothes. The few rags that were left on him, hardened by the frost, were sharp as glass and took off his skin. He was growing cold, but the other child was growing warm. What he lost was not lost, she gained it. He observed this warmth, which was a new lease of life for the poor little girl. He continued to advance.

From time to time, without ceasing to hold her firmly, he stooped down, took a handful of snow with one hand, and rubbed his feet with it to keep them from freezing.

At other times, feeling his throat on fire, he placed in his mouth a little of this snow and sucked it, which deceived his thirst a moment, but changed it into fever. The relief was an aggravation.

By dint of its violence the storm had become shapeless; deluges of snow are possible, this was one. In its fury it lashed the shore at the same time that it upturned the sea. It was probably the moment when the lost ork was breaking up in the conflict of the shoals.

Under this blast, always walking eastward, he crossed wide expanses of snow. He knew not the hour. For a long time he

had seen no more smoke. Nocturnal signs are easily effaced; besides, it was past the time when fires are extinguished; finally, he might have been mistaken, and possibly there was neither town nor village in the direction whither he was going.

In this doubt he persevered.

Two or three times the little one cried. Then he imparted to his walk a rocking motion, and she was quieted and hushed. She finished by falling fast and sound asleep. Shivering himself, he felt that she was warm.

Frequently he tightened the folds of the jacket about the little girl's neck, so that the frost could not introduce itself by any opening, and that no melted snow might trickle between the garment and the child.

The plain was undulating. On its descending slopes the snow, heaped up by the wind in the bends of land, was so high for a little fellow like him that he sank into it almost entirely and had to walk half buried. Still he walked, and pushed the snow aside with his knees.

The ravine surmounted, he arrived on highlands swept by the gale, where the snow was thin; there he found a glazing of frost.

The warm breath of the little girl fanned his cheek, restored his warmth a moment, then stopped and froze in his hair, where it made an icicle.

He was sensible of an additional danger; he could no longer fall. He felt that he would not be able to rise again. He was broken down with weariness, the weight of the darkness would have fixed him to the ground, like that dead woman, and the ice would have soldered him alive to the earth. He had lost his way on the slopes of precipices and escaped, he had tripped into holes and crept out of them; but now a simple fall was death. A misstep opened the tomb. He must not slip. He would not have strength even to get on his knees again.

Now every thing around him was slippery, all was hoarfrost and hardened ice.

The little girl whom he carried in his arms made his progress frightfully difficult. Not only was she a weight, and an over-weight for his weariness and exhaustion, but she was an embarrassment. She occupied both his arms, and for one whose road is over glazed frost, both arms are a natural and necessary balance.

This balance he had to do without.

He did without it; and walked on, not knowing what would become of him under his load.

This little one was the drop that made his cup of distress overflow.

He proceeded, wavering at every step, as if on a loose board, and accomplishing miracles of equilibrium, with none to see him. And yet, perhaps, let us say it again, he was followed on his doleful way by two eyes, open in the shadowy distance—the eye of the mother, and the eye of God.

He staggered, lost his balance, reestablished it, kept watch on the child, replaced some part of the garment on her, covered her head, went on, lost his balance again, slipped, then recovered himself. The wind was cowardly enough to jostle him.

Probably he went much farther than was necessary. He was apparently in those plains where the Bincleaves farm was afterward established, between what is now called Spring-Gardens and the Parsonage House. Dairy-farms and cottages now, wastes then. Often less than a century separates a steppe from a city.

Suddenly, as the glacial squall which blinded him had an intermission, he perceived at a little distance before him a group of gables and chimneys, relieved by the snow against the sky, the reverse of a silhouette, a town sketched in white upon the black horizon, something like what one would call now-a-days a negative proof.

Roofs, dwellings, a sleeping-place! He was somewhere, then! He felt the ineffable encouragement of hope. His emo-

tions were those of the lookout of a lost ship, when he cries land! He hastened his steps.

He was reaching men at last. He was going to arrive among the living. Nothing then to fear. He had in him the sudden glow of security. That from which he was escaping had no more existence. There would be no more night now, nor winter, nor storm. It seemed to him that every possibility of evil was thenceforth behind him. The girl was no longer a burden. He almost ran.

His look was fixed on those roofs. Life was there. He never took his eyes off them. The dead might gaze thus at something that appeared through the half-opened lid of the tomb.

These were the chimneys whose smoke he had seen.

But no smoke rose from them now.

He did not take long to reach the habitations. He arrived at a suburb of the town, which was an open street. The fashion of closing streets at night was then going out.

The street began with two houses. In these two houses no candle or lamp was to be seen, no more than in all the street, nor yet in all the town, as far as the eye could reach.

The house on the right was rather a roof than a house; nothing could be meaner; the walls loam, and the roof straw: there was more thatch than wall. A large nettle, springing from the foot of the wall, touched the rim of the roof. This hut had but one door, which looked like a cat-hole, and one garret window. All shut. An inhabited sty alongside showed that the hovel was also inhabited.

The house on the left was wide and high, all of stone, with a slate roof. Shut, too. The rich man's home opposite the poor man's.

The boy did not hesitate. He went up to the large house. The folding-door, a massive oak plank checkered with big nails, was one of those sure to have behind it a stout provision of bolts and locks. There was on it an iron knocker.

He lifted the knocker, and with some difficulty, for his congealed hands were more like stumps; he knocked once.

No answer.

He knocked a second time, two knocks.

There was no stir in the house.

He knocked a third time. Nothing.

He understood that they were asleep, or did not care to get up.

Then he turned to the home of poverty. He took up a pebble from the snow and knocked at the low door.

No answer.

He raised himself on tiptoe and struck with his stone on the window, softly enough not to break the glass, hard enough to be heard.

No voice answered, no step stirred; no candle was lighted.

He thought that there also they did not choose to awake.

There was the same deafness to the appeal of poor devils, in the stone mansion and the thatched hut.

The boy decided to push on farther. He penetrated the defile of houses which stretched before him, so dark that it looked like the opening between two cliffs rather than the entrance of a town.

#### IV.

##### THE DESERT UNDER ANOTHER FORM.

He had just entered Weymouth.

The Weymouth of that time was not the respectable and superb Weymouth of to-day. This old Weymouth had not, like the present one, an irreproachable rectilinear quay, with a statue and an inn in honor of George III. This was owing to the fact that George III. was not born. For the same reason, there had not yet been sketched on the green slope of the west hill, flat on the ground, by means of turf stripped and chalk exposed, that white horse an acre long, carrying a king on his back, and turning tail, still in honor of George III., to the town.

Surely these honors were merited. George III., having lost in his old age the wits that he never had in his youth, is not responsible for the calamities of his reign. He was a harmless madman. Why should he not have statues?

The Weymouth of a hundred and eighty years ago was about as symmetrical as a handful of jackstraws mixed up. The As-taro-th of the legend used to walk about on earth carrying on her back a wallet, in which there was a little of every thing, even good wives in their houses. A jumble of huts fallen from this demon's bag would give an idea of the old, irregular Weymouth. That is, adding the good wives in the huts. There remains a specimen of these buildings, the Musicians' House. A confused mass of wooden sheds, carved and worm-eaten (which is another kind of carving), shapeless, shaky, overhanging buildings—some with columns, leaning one against another to avoid falling before the sea-wind, and leaving between them narrow intervals of crooked and inconvenient streets, lanes, and squares often inundated by the equinoctial tides, a pile of old grandmotherly houses grouped around an ancestral church; such was Weymouth. It was a sort of old Norman village stranded on the English coast.

The traveller, if he entered the tavern, now replaced by the hotel, instead of gallantly paying a pound for a fried sole and a bottle of wine, suffered the humiliation of eating a twopenny chowder, and a good one, for that matter. It was lamentable.

The lost child, carrying the foundling, followed the first street, then the second, then a third. He raised his eyes, looking for lighted windows in the different stories and on the roofs, but all was closed and dark. Occasionally he knocked at the doors. No one answered. Nothing makes people so stony-hearted as lying warm between two sheets. His noises and motions had finally waked the little girl. He knew it because he felt her sucking his cheek. She did not cry, thinking she had a mother.

He was in danger of prowling about a long while in the cross-lanes of Scrambridge, where there were then more crops than houses, and more thorn-hedges than buildings; but just in time he entered a passage which still exists near Trinity School. This passage brought him to a wharf, which was but a rudimentary quay with a parapet, and on his right he made out a bridge.

This bridge was the bridge of the Wey, joining Weymouth to Melcomb-Regis, and under the arches of which the harbor communicates with the Back Water.

Weymouth was then a hamlet, suburb of Melcomb-Regis, town and harbor; to-day, Melcomb-Regis is a parish of Weymouth. The village has absorbed the town. This feat is due to the bridge. Bridges are odd sucking-machines which draw off population, and sometimes make a river quarter grow at the expense of its opposite neighbor.

The boy went to the bridge, which at that time was a foot-way of covered plank. He crossed the footway.

Thanks to the roof of the bridge, there was no snow on the flooring. His bare feet had a moment of comfort in walking on the dry planks.

The bridge crossed, he found himself in Melcomb-Regis.

There he found fewer wooden houses than stone ones. It was no longer the suburb, but the town. The bridge opened upon a tolerably handsome street, which was Saint Thomas Street. He entered it. The houses presented high carved gables, with shop fronts here and there. He began knocking at the doors again. He had not strength enough left to call and shout.

At Melcomb-Regis, as at Weymouth, no one stirred. All the doors had been well double-locked. The windows were covered by their blinds as eyes are by their lids. Every precaution had been taken against the disagreeable start which results from being suddenly awaked.

The little wanderer felt the indefinable oppression of the

sleeping town. A vertigo emanates from the silence of these paralyzed ant-hills. All these lethargies combine their nightmares; you are mobbed by sleepers; a vapor of dreams is evolved from these prostrate human bodies. Sleep has dark neighborhoods outside of life; the decomposed thought of the sleeping floats above them, a half-dead, half-living emanation, and unites itself with all the possible or probable thought in space. Hence strange entanglements. The transparent opacity of the dream-cloud veils the spirit-star. Above those closed eyelids, in which vision has replaced sight, a spectral disintegration of profiles and looks spreads itself in the impalpable. Mysterious scattered existences fuse themselves into our life, through that boundary of death called sleep. These inter-twinings of shades and souls fill the air. Even he who is not asleep feels oppressed by this surrounding of dark and ominous life. The circulating chimera worries him like a guessed reality. The man wide awake, whose road lies across the dreams of others, dimly repels passing forms, has or thinks he has the vague horror of hostile contacts with the invisible, and feels every instant the doubtful jostle of something inexpressible, which vanishes as it meets him. Such progress in the midst of the nocturnal diffusion of dreams is something like walking through a forest.

This is what we call being afraid without knowing why.

What a man experiences, a child experiences still more. This uneasy feeling of nightly terror, augmented by the spectral houses, was an additional aggravation of the sad circumstances against which he struggled.

He entered Conycar Lane, and perceived at the end of this alley the Back Water, which he took for the ocean; he no longer knew which way the sea lay; he retraced his steps, turned to the left by Maiden Street, and went back as far as Saint Alban's Row.

There he knocked violently on the doors of the first houses he met, quite at random and without choice. These knocks, in which he expended his last energy, were irregular and jerky, with intermissions and returns almost wrathful. It was the beating of his fever.

A voice answered.

That of the hour.

Three in the morning sounded slowly behind him from the old belfry of Saint Nicholas.

Then all was still again.

It may seem surprising that not one inhabitant even half-opened a window. But this silence can be in some measure explained. It must be stated that, just before January, 1690, there had been a tolerably severe pestilence in London, and that the fear of taking in sick vagabonds caused a certain diminution of hospitality everywhere. One would not even half-open a window, for fear of breathing the air which they had infected.

The child found the coldness of men more terrible than the coldness of the night. It is a coldness with a will in it. He felt an anguish of heart, a discouragement, which he had not felt in the wilds. Now that he had entered into the life of all the world, he remained alone. He had understood the un pitying waste, but the inexorable town was too much for him.

The clock, whose strokes he had just counted, overwhelmed him still more. On certain occasions, there is nothing that freezes like a clock striking. It is a declaration of indifference; eternity saying, What care I?

He stopped. And it is not certain but that in that melancholy moment he asked himself if it was not the simplest way to lie down and die. But the little girl laid her head on his shoulder and went to sleep again. This vague confidence encouraged him to start again.

He felt that he was a support, he, around whom every thing was giving way. It was a profound call of duty.

Neither his ideas nor his situation were those of his age.

Probably he did not understand them. He acted instinctively. He did what he did.

He walked in the direction of Johnstone Row.

Or rather he dragged himself, for he could walk no longer. He left Saint Mary Street, turned to the right, zigzagged about in the alleys, and, at the mouth of a winding gut between two buildings, found himself in a tolerably large open space. It was doubtful ground, not built up, probably the spot where Chesterfield Place now is. There the houses ended. He saw the water on his left, and scarcely any thing more of the town on his right.

What was to become of him? the country was beginning again. On the east great sloping plains of snow marked the ridges of Radipole. Should he continue his journey, go on, and reënter the waste? Should he turn back and reënter these streets? What could he do between these two silences, the mute wilds and the deaf town? Which repulse should he choose?

There is a last anchor and there is a last look. It was this last look which the poor despairing child cast around.

Suddenly he heard a threat.

## V.

### MISANTHROPY PLAYING ITS PRANKS.

A GNASHING of teeth, doubtful, strange, alarming, reached him through the dark.

It was enough to make one recoil. He advanced. To those who are terrified by silence, a roar is an agreeable variety.

The fearful growl reassured him. The threat was a promise. There was something alive and awake there, even were it a wild beast. He walked in the direction of the gnashing.

He turned an angle of the wall, and behind it, by the reflection of the snow and the sea, which made a kind of vast sepulchral illumination, he saw something sheltered there somehow. It was a cart, unless it was a hut. A carriage, for it had wheels, and a dwelling, for it had a roof. From the roof rose a pipe, and from the pipe a smoke. This smoke was ruddy, which seemed to denote a pretty good fire inside. Behind, projecting hinges indicated a door, and in the middle of this door a square opening allowed gleams of light to be seen in the hut. He approached.

Whatever had gnashed its teeth heard him coming. When he was close to the hut, the threat became furious. It was no longer a growl, but a howl that he had to do with. He heard a harsh noise like that of a chain violently stretched, and suddenly under the door, in the space between the hind wheels, appeared two rows of sharp white teeth.

As the throat showed itself between the wheels, a head peeped out of the window.

— Quiet there! said the head.

The throat was silent.

The head continued:

— Any one there?

The boy replied:

— Yes.

— Who?

— Me.

— You? Who's that? Where from?

— Tired, said the boy.

— What o'clock is it?

— Cold.

— What are you doing there?

— Hungry.

The head answered:

— Everybody can't be as well off as a lord. Get out.

The head retired, and the window closed.

The boy bowed his forehead, hugged the sleeping child tighter, and mustered his strength to start again. He took some steps and was beginning to go away.

But at the same time that the window closed, the door opened. A step was let down. The voice, which had just spoken to the boy, called angrily from the depths of the hut.

— Well, why don't you come in?

The boy turned round.

— Come in, will you? repeated the voice. Who sent me a young scapegrace like that? Cold and hungry, and won't come in?

The child, at the same time repulsed and invited, remained motionless. The voice recommenced:

— Come in, I tell you, you scamp!

He made up his mind, and placed his foot on the first round of the ladder.

But there was a growl under the vehicle. He started back. The gaping throat reappeared.

— Quiet! cried the man's voice.

The throat went back, the growling stopped.

— Up with you! continued the man.

The child ascended the three steps with difficulty. He was impeded by the other child, so benumbed, so wrapped and rolled up in the sou'wester, that no part of her could be distinguished; she was only a little shapeless lump.

He surmounted the three steps, and having reached the threshold stopped there.

No candle burned in the hut, an economy probably due to poverty. The hovel was only lighted by the red air-hole of a cast-iron stove in which a fire of turf crackled. On the stove smoked a porringer and a pot, which certainly looked as if they held something good. The agreeable odor of it was very perceptible. The dwelling had for furniture a chest, a bench, and an unlighted lantern, hung from the ceiling. On the wooden walls were some shelves supported by brackets, and a row of hooks and nails, with all sorts of things hanging to them. There were several stories of glass-ware and copper-ware, an alembic, a receiver much like those jugs for graining wax which are called markers, and a medley of queer objects which the child could not understand in the least, and which were the cooking utensils of a chemist. The hut was of an oblong shape, the stove in front. It was not a small room, it was hardly a large box. The outside was more lighted by the snow than the inside by the stove. Every thing in the hovel was dim and indistinct. Still a reflection of the fire-light on the ceiling allowed one to read there this inscription in large letters, *URSUS PHILOSOPHER*.

In fact, the child was entering the house of Homo and Ursus. He had just heard one growl and the other speak.

Arrived on the threshold, he saw, near the stove, a tall, thin, hairless old man, dressed in gray stuff; he was standing up, and his bald head touched the roof. He could not have risen on his toes; the hut was a tight fit.

— Come in, said the man, who was Ursus.

The boy entered.

— Put your bundle there.

The boy placed his burden on the chest, carefully, for fear of frightening and waking it.

The man continued:

— How softly you put it there! It might as well be a reliquary. Are you afraid of cracking your tatters? Ah, the good-for-nothing wretch! In the streets at this hour. Who are you? Answer. No, don't! Here, this is the first thing; you're cold, warm yourself.

And taking the lad by the shoulders, he pushed him before the stove.

— Well, you are wet enough! and frozen enough! The idea of coming into a house in such a state! Here, take off that rotten stuff, young malefactor!

Clutching the boy with feverish suddenness, he stripped off his rags with one hand, making lint of them in the process, while with the other hand he hooked down from a nail a man's shirt, and one of those knit jackets which are now called kiss-me-quicks.

— There are some duds.

In the heap of rubbish he picked out a woollen rag, and rubbed with it before the fire the limbs of the dazzled and sinking child, who, in this moment of naked warmth, thought he was seeing and touching heaven. Having rubbed his limbs, the man wiped his feet.

— Well, my dead man, you have nothing frozen. I was stupid enough to fear that there was something frozen, a hind-paw or a fore-paw. He won't be disabled this time. Dress yourself!

The child slipped into the shirt, and the man put the knit jacket over it.

— Now then.

The man kicked the bench forward and seated the little boy on it, pushing him by the shoulders as before, then he showed him with his forefinger the porringer smoking on the stove. What the child caught a glimpse of in this porringer was some more heaven.

Namely, a potato and a bit of bacon.

— You're hungry, eat.

The man took from a shelf a crust of dry bread, and an iron fork, and handed them to the boy. The boy hesitated.

— Must I lay the cloth for you? asked the man.

And he placed the porringer on the child's lap.

— Bite into that!

Hunger got the better of stupefaction; the child began to eat. The poor creature devoured rather than fed. The joyous sound of the crunched bread filled the hut. The man kept grumbling.

— Not so fast, you horrid gormandizer! What a glutton the wretch is! These hungry blackguards have a revolting way of feeding. Just see a lord at supper! I have seen dukes eat in my life. They don't eat, that's aristocratic. They drink, though, that they do. Come, you little monkey, stuff yourself!

The want of ears, which characterizes a hungry belly, caused the child to pay small heed to this violence of epithet, modified too as it was by a charity of action, profitable inconsistency for him. For the moment he was absorbed by these two needs and two ecstasies, warming himself and eating.

Ursus continued to himself his half-audible imprecation.

— I have seen King James in person supping at the Banqueting-House where they go to look at the pictures of the renowned Rubens. His majesty touched nothing. This beggar here browses—browses is the word—it comes from brute. What possessed me to come to this Weymouth, seven times devoted to the infernal gods? I have sold nothing since morning, talked to the snow, played the flute to the hurricane, not pocketed a farthing, and at night I have paupers on my hands! Disgusting place! There is a pitched battle between these lounging fools and me. They try to get off with giving me farthings, and I with giving them worthless drugs. Well, to-day not an idiot in the square, not a penny in the box. Eat, you imp of hell! Scrape and crunch! Nothing equals the impudence of spongers now-a-days. Fatten at my expense, parasite. He is more than starved, he is mad, this creature. It's not appetite. It's fever. Who knows? Perhaps he has the plague. Have you the plague, young ruffian? If he were to give it to Homo! God forbid! Let the rabble go, but I don't want my wolf to die. Come to think of it, I'm hungry too. Positively this is a disagreeable occurrence. I have worked to-day far into the night. There are times in one's life when one is hurried. I was in a hurry to-night to eat. I'm all alone, I make a fire, I have only a potato, a crust of bread, a mouthful of bacon, and a drop of milk. I put it to warm, I say to myself, Good! I think I'm going to feast myself. Flop! tumbles in this crocodile upon me. He plants himself solidly between my provision and me, and my larder is devastated. Eat, you pike, eat, you shark; how many rows of teeth have you in your maw, stuffer, young wolf? No, I withdraw the word, out of respect for the wolves. Absorb my provender, boar! I have

worked to-day my stomach empty, my throat crying out, my pancreatic ducts in disorder, and my entrails shattered, far, far into the night, and my reward is to see another eat. Never mind, share and share. He will have the bread, the potato, and the bacon, but I shall have the milk.

And at this moment a lamentable and prolonged cry sounded in the hut. The man pricked up his ears.

— You're crying now, sycophant! What's that for?

The boy turned. He was evidently not crying. He had his mouth full.

The crying did not stop.

The man went to the chest.

— It's the bundle that's bawling! Valley of Jehoshaphat! Here's the bundle vociferating! What's the matter with your bundle that it is croaking?

He unrolled the sou'wester. A child's head emerged, the mouth open and crying.

— Hallo! who comes here? said the man. What's this? Another one. It's not going to stop, then? Who's there? To arms! Corporal, turn out the guard! Second irruption! What have you brought me there, you young robber? You see clearly that she's thirsty. Come, she must drink, this one. Good! No milk for me now.

From a confused heap on a shelf he took a roll of bandage—linen, a sponge, and a phial, growling like a madman.

— Damned country!

Then he looked at the little one.

— It's a girl. Can tell that by her yelping. She's drenched, too.

He tore off her, as he had done off the boy, the rags in which she was knotted rather than dressed, and wrapped her in a bit of coarse linen, shabby but clean and dry. This quick and abrupt toilet incensed the little girl.

— She won't stop mewling, said he.

With his teeth he cut off a large strip of the sponge, tore from the roll a square piece of linen, drew out a bit of thread from it, took from the stove a pot which contained milk, filled the phial with this milk, pushed the sponge half into the neck of the phial, covered the sponge with the linen, tied this extemporized cork with the thread, pressed the phial against his cheek to make sure that it was not too hot, and seized under his left arm the lost swaddling, who continued to scream.

— There, sup, you animal! Take the breast! And he placed the neck of the phial in her mouth.

The little girl sucked greedily.

He held the phial at the proper inclination, muttering:

— They're all alike, the mean creatures! When they have what they want, they keep quiet.

The child had sucked so energetically, and seized with such eagerness the apology for bosom presented her by this surly providence, that she was seized with a fit of coughing.

— You're going to choke yourself, growled Ursus. A nice glutton you are!

He withdrew the sponge which she was sucking, waited till the cough stopped, and then replaced the phial between her lips, saying,

— Suck, you little vagabond.

Meanwhile the boy had laid down his fork. A moment before, when he was eating, his looks expressed satisfaction. Now they expressed gratitude. He saw the girl regaining life, and this consummation of the resurrection which he had begun filled his eyes with an ineffable expression. Ursus continued mumbling angry words between his gums. The poor boy at moments raised to Ursus his eyes, moist with the indefinable emotion which the poor creature, bullied and melted at the same time, felt without being able to express.

Ursus addressed him furiously.

— Well, eat away!

— And you? said the child all trembling, with a tear in his eye. Won't you have some?

— Eat it all, you imp! There is not too much for you, since there wasn't enough for me.

The child resumed his fork, but ate nothing.

— Eat, yelled Ursus. What have I to do with it? Who's talking to you about me? You wretched little barefoot clerk of Nopenny parish, I tell you to eat it all. That's what you're here for, to eat, drink, and sleep. Eat, or I'll pitch you out of doors, you and your brat!

At this threat the boy recommenced eating. It did not take him long to finish what remained in the porringer.

— This building has cracks, muttered Ursus; the cold comes in at the window.

In fact a pane had been broken, by some jolt of the vehicle or some roguish boy's stone. The piece of paper with which Ursus had repaired this damage was loosened. The wind entered there.

He was half-seated on the box. The little girl, at the same time in his arms and on his knees, was voluptuously sucking the bottle in the dreamy beatitude of a cherub before God or a child at the breast.

— She's tipsy, said Ursus.

And he continued:

— Preach sermons on temperance, will you?

While the little girl drank and the little boy ate, Ursus continued to vent his ill-humor.

— Drunkenness commences at the cradle. It is worth while to be Archbishop Tillotson, and thunder against the abuse of liquor! Abominable draught of wind! And my stove is old, too. It lets loose puffs of smoke enough to give one a disease of the eyes. I have the inconvenience of cold and the inconvenience of fire together. I can't see clearly. This being here, who abuses my hospitality—well, I haven't been able yet to distinguish the cur's face. Comfort is lacking here. By Jupiter, I value highly exquisite banquets in well-protected rooms. I have missed my vocation. I was born to be sensual. The greatest of sages was Philoxenes, who wished for a crane's neck, that he might enjoy the pleasures of the table at greater length. Zero of receipts to-day! Nothing sold all day long! What a calamity! Inhabitants, lackeys, and burgesses, here is the doctor, here is the medicine! You're losing your time, old fellow. Pack up your drugs again. Everybody here is well. There's a blessed town for you, with nobody sick in it!—except the sky, which has the diarrhoea. What a snow! Anaxagoras taught that snow was black. He was right, for cold is darkness. Ice is night. What a blast! I fancy those at sea have a nice time of it. A hurricane is the passing of devils, the tumult of ghouls galloping and rolling headlong, above our bags of bones. In the storm-cloud, this has a tail and that horns; one has a flame for a tongue, another claws on his wings, a third a lord-chancellor's paunch, a fourth an academician's pate; you can tell a figure in each sound. Every new word has a different devil; the ear hears them, the eye sees them; the tumult is a face. To be sure, there are people at sea, it's evident. My friends, manage the tempest as well as you can; I've enough to do to manage my life. Bah! do I keep an inn? Why have I travellers arriving? The universal distress has even splashed into my poverty. Hideous drops of the great mud of humanity fall into my hut. I am given up to the voracity of passers-by. I am a prey. The prey of wretches dying of hunger. Winter, night, a pasteboard hovel, a poor friend under me outside, a storm, a potato, a fire as big as your fist, parasites, the wind entering at every crack, not a penny, and bundles that fall a-barking! You open them, and find little beggar-wenches inside. Isn't it like witchcraft! And then the broken laws! Ah, vagabond with your vagabondess! Sly pickpocket, designing abortion! Ah, you go about the streets after curfew! If our good king knew it, he's the man that would plant you nicely in a cell under-ground, to teach you manners! Master takes his walk at night with miss! The thermometer at fifteen, bareheaded and barefooted! That's contrary to law. There

are rules and ordinances, young rioter! Vagabonds are punished, honest folks who have houses of their own are defended and protected, kings are the fathers of their people. I am a householder, I am. You would have been whipped on the public square, if they had caught you; and served you right! There must be order in a state which has police. I have done wrong myself in not reporting you to the constable. But I am like that, I understand the right and do the wrong. Ah the ruffian! to arrive here in that state! I didn't remark their snow when they came in; now it is all melted. Here is my whole house wet. I have an inundation within doors. I must burn an impossible lot of coal to dry up this lake. Coal, at twelve farthings the measure. How will this hovel manage to hold three of us? It's all up with me now, I go into the nursing business, I shall have the future hope of England's beggards to wean. I shall have for employment, office, and function, to shape the abortions of Mother Misery, to polish off the ugliness of gallows-birds in their tender age, and instruct young thieves in the principles of philosophy. The bear's tongue does God's rough-hewing. And to think that if I hadn't been nibbled away for thirty years by such specimens, I should be rich! Homo would be fat. I should have a medical cabinet full of rarities, as many surgical instruments as Doctor Linaire, King Henry VIII.'s surgeon, various animals of all kinds, Egyptian mummies, and other such things! I should belong to the college of doctors, and have the right to use the library built in 1652, by the celebrated Harvey, and to go and work in the lantern of the dome, from which you can see all the town of London. I might continue my calculations on the solar darkness, and prove that a caliginous vapor emanates from that heavenly body. This is the opinion of John Kepler, who was born the year before Saint Bartholomew's day, and who was the emperor's mathematician. The sun is a chimney which smokes sometimes. So does my stove. My stove is no better than the sun. Yes, I should have made my fortune, my appearance would be quite different, I should not be vulgar, I should not abase science in the cross-roads. For the people is not worthy of learning, since it is only a mob of fools, a confused mixture of ages, sexes, tempers, and conditions of every sort, which the wise men of all times have not hesitated to despise, and whose extravagance and fury the most moderate men justly abhor. Ah, I am tired of what is. After all, we don't live long. It is soon over, our human life. Well, no, it is long. At intervals, that we may not be discouraged, that we may be stupid enough to consent to live, that we may not profit by the magnificent opportunities of hanging ourselves furnished by every cord and every nail, Nature makes believe to take a little care of man. Not to-night, though. Cunning Nature! She makes the corn shoot, the grape ripen, the nightingale sing. From time to time a ray of sunshine or a glass of gin, that is what we call happiness. A little fringe of good around the immense shroud of evil. The devil has made the stuff of our life, and God makes the hem. Meanwhile, you have eaten my supper, young robber!

The infant, whom he still held in his arms, and very gently too, despite his anger, closed her eyes drowsily, a sign of repletion. Ursus examined the bottle and growled.

— She has drunk it all, the little impudence!

He rose, and keeping the girl on his left arm, raised, with his right hand, the lid of the chest, and took from the inside a bear-skin, which, it will be remembered, he called "his own real skin."

While doing this he heard the other child eating, and looked askance at him.

— It will be a pretty business if I must in future feed this growing glutton. I shall have a tape-worm in the belly of my trade.

Still, with one hand, he spread as he best could the bear-skin on the chest, pushing with his elbow and managing his motions so as not to disturb the commencement of the child's sleep

Then he laid her on the skin, upon the side nearest the fire. This done, he placed the empty phial on the stove, and exclaimed:

—I know who's thirsty.

He looked into the pot; there remained some good spoonfuls of milk in it; he raised it to his lips. Just as he was going to drink, his eye fell on the little girl. He replaced the pot on the stove, took the phial, uncorked it, poured in what remained of the milk, just enough to fill it, replaced the sponge, and retied the linen over the sponge round the neck.

—I am hungry and thirsty for all that, he recommenced.

And he added:

—When one can't eat bread, one drinks water.

Behind the stove there was a glimpse of a jug with a broken spout.

He took it and offered it to the boy.

—Do you want to drink?

The child drank and resumed his repast.

Once more Ursus took the jug and raised it to his mouth. The temperature of the water which it contained had been unequally affected by the neighborhood of the stove. He swallowed some mouthfuls and made a face.

—Make-believe pure water, thou art like false friends! Lukewarm above and cold below.

By this time the boy had finished supper. The porringer was more than emptied, it was scoured. He picked up and eat, abstractedly, some crumbs of bread scattered in the folds of the woollen garment and on his lap.

Ursus turned to him.

—That's not all. We two have to understand each other now. The mouth is not made alone for eating; it is also made for speaking. Now that you are warmed and stuffed, young animal, look out for yourself! You are going to answer my questions. Where do you come from?

The child replied:

—I don't know.

—How? you don't know!

—I was left on the edge of the sea to-night.

—Ah, the scamp! What's your name? He is such a bad character that his relations have abandoned him.

—I have no relations.

—Please attend to my wishes, and observe that I don't like people to tell me stories which are not true. You have some relations, for you have a sister.

—That is not my sister.

—She is not your sister?

—No.

—What is she, then?

—A little girl that I found.

—Found!

—Yes.

—How? you picked that thing up?

—Yes.

—Where? If you lie, I'll exterminate you.

—From a woman dead in the snow.

—When?

—An hour ago.

—Where?

—A league off.

The frontal arches of Ursus contracted, and assumed the pointed form which characterizes the eyebrows of a philosopher who is moved.

—Dead! there's one that's happy! We must leave her in her snow there. She is well off in it. Which way was it?

—In the direction of the sea.

—Did you cross the bridge?

—Yes.

Ursus opened the back window and examined the prospect outside. The weather had not changed for the better. The snow still fell, thick and gloomy.

He closed the casement.

He went to the broken pane, stopped the hole with a rag, put more turf in the stove, spread out as widely as he could the bear-skin on the chest, took a large book which he had in a corner and placed it under the head to serve as pillow, and on this bolster he laid the head of the little sleeping child.

Then he turned to the boy:

—Lie down there.

The child obeyed, and stretched himself at full length beside the little girl.

Ursus rolled the skin round the two children and tucked it under their feet.

Then he reached down from the shelf and knotted around his body a canvas girdle with a large pocket, probably containing a surgeon's case of instruments and some bottles of elixirs.

Next he unhooked the lantern from the ceiling and lit it. It was a dark-lantern, which, when lighted, left the children in the shadow.

Ursus partly opened the door and said:

—I'm going out. Don't be afraid. I shall come back. Go to sleep.

And lowering the steps he cried:

—Homo!

An affectionate growl answered him.

Ursus descended, lantern in hand. The step went up again, the door closed. The children remained alone.

From without, a voice, the voice of Ursus, asked:

—You boy, who have just eaten my supper, you are not asleep yet, are you?

—No, replied the boy.

—Well, then, if she squalls, give her the rest of the milk.

The clank of a loosened chain was heard, and the noise of a man's step and a beast's, as they went away together.

A few moments, and the two children slept profoundly.

It was a strange, ineffable union of respirations, ignorance rather than chastity, a bridal night before the birth of sex. The little boy and the little girl, naked and side by side, enjoyed during these silent hours a shadowy divine fusion; as many dreams as are possible at that age, floated from one to the other; under their closed lids was probably a starry light; if the word marriage be not out of place here, they were man and wife as angels are angels. Such innocence in such darkness, such purity in such embraces, these anticipations of heaven are only possible to infancy, and no immensity approaches the grandeur of these little beings. Of all gulfs this is deepest; the terrible persistence of a dead man hanged in chains, the vast, unremitting fury of the ocean against a shipwrecked bark, the widespread whiteness of the snow covering buried forms—none of these equals in pathos two children's mouths divinely joined in sleep, whose touch is not even a kiss. Perhaps betrothal, perhaps doom, the unknown overhangs this juxtaposition. It is charming; who knows if it is not terrifying? One feels anguished of heart. Innocence, the offspring of consecrated obscurity, is more supreme than virtue. They slept. They were at rest. They were warm. The nakedness of their intertwined bodies fused the virginity of their souls. They were there as in the nest of the infinite.

## VI.

### WAKING.

THE day began gloomily. A sad paleness entered the hut. It was the icy dawn. Its wan gleams, that brought out in mournful reality the spectral sketches of night, did not wake the children, who were sound asleep. The hovel was warm. Their two respirations sounded alternately like two quiet waters. There was no more hurricane outside. The light of the dawn was slowly taking possession of the horizon. Like candles blown out one after the other, the constellations faded away. Only some large stars still held out. The deep chant of the infinite rose from the sea.

The fire was not quite out. The dawn was gradually becoming day. The boy slept less than the girl. There was something of the watcher and the guardian about him. As a ray brighter than the rest traversed the glass, he opened his eyes. The sleep of childhood ends in forgetfulness; he remained in a half-doze, without knowing where he was, or what he had near him, without trying to remember, looking at the ceiling, and vaguely puzzling his reverie with the letters of the inscription *Ursus philosophus*, which he examined without deciphering, for he could not read.

The noise of a key groping in a lock made him lift his head.

The door turned on its hinges, the stairway swung. Ursus was coming home. He ascended the three steps, his extinguished lantern in his hand.

At the same time there was a patter of four feet lightly mounting the stairs. It was Homo, following Ursus and coming home, too.

The boy, now wide awake, gave a start.

The wolf, probably hungry, had put on his morning grin, which showed all his teeth, and very white they were.

He stopped half-way up, put his two fore-paws into the hut, leaving his legs on the threshold as a preacher leans his arms on the edge of the pulpit. He smelt at a distance the chest which he was not used to see thus occupied. His wolf's figure, framed in the door, stood out black in the morning light. He decided and entered.

Seeing the wolf in the hut, the boy rose up out of the skin and placed himself before the little girl, who slept more soundly than ever.

Ursus had just restored the lantern to its hook on the ceiling. Silently and with mechanical deliberation he unbuckled his girdle, in which his case of instruments was, and replaced it on a shelf. He looked at nothing and seemed to see nothing. His eyeballs were glassy. Something profound was at work in his mind. At length his thoughts came to light, as usual, by a rapid utterance of words. He cried out:

—Decidedly happy! Dead, quite dead!

He stooped down and placed a shovelful of turf on the fire, and, while poking it up, grumbled on:

—I had trouble to find her. Unknown malice had plunged her under two feet of snow. Without Homo, who sees as clearly with his nose as Christopher Columbus did with his mind, I should be there still paddling about in the snow and playing hide-and-seek with death. Diogenes took his lantern and looked for a man; I took mine and looked for a woman; he found sarcasm, and I found mourning. How cold she was! I touched her hand, it was a stone. What silence in the eyes! How can one be stupid enough to die and leave an infant behind! It will not be comfortable keeping three in this box. What a bore! Well, I have a family now. Daughter and son.

While Ursus was speaking, Homo had stolen close to the stove; the hand of the little sleeper hung down between the stove and the chest. The wolf began to lick the hand.

He licked it so softly that the girl did not wake.

Ursus turned round.

—Good, Homo. I shall be father, and you uncle. Then he resumed his philosophical work of arranging the fire, without interrupting his aside.

—Adoption. It's decided. Besides, Homo consents.

He stood up again.

—I should like to know who is responsible for this woman's death. Is it man or...

His eye looked into the air, but above the ceiling, and his mouth murmured:

—Is it thou?

Then his forehead dropped as if under a weight, and he resumed:

—The night has taken the trouble to kill this woman.

As he drew himself up again, his look met the face of the awakened boy, who was listening to him. Ursus addressed him abruptly:

—What's the reason you're laughing?

The boy replied,

—I am not laughing.

Ursus had a sort of tremor, examined him very attentively and silently, for some moments, and said,

—Then you are frightful.

The inside of the hut was so dimly lighted at night, that Ursus had not yet seen the boy's face. The full day showed it to him.

He placed his palms on the child's shoulders, regarded his face with an attention more and more penetrating, and cried to him:

—Don't laugh any more!

—I don't laugh, said the child.

Ursus shook from head to foot.

—You do laugh, I tell you.

Then shaking the child in a grasp which might arise from rage or pity, he asked in a violent tone:

—Who made you so?

The child replied:

—I don't know what you mean.

Ursus resumed:

—How long have you had that laugh?

—I have always been so, said the child.

Ursus turned to the chest, saying in a low tone:

—I thought that business was out of date. He took out very carefully, so as not to wake the little girl, the book which he had put under her head for a pillow.

—Let us look at Conquest, he muttered.

It was a bundle of folio sheets, bound in parchment. He ran through the leaves with his thumb, stopped at one, opened the book wide over the stove and read.

—*De Denasatis*—here it is.

And he went on:

*Bucca fissu usque ad aures, gencivis denudatis, nasoque muredridato, masca eris et ridebis semper.*

—That is it exactly.

And he replaced the book on one of the shelves, growling:

—An incident, the investigation of which would be unwholesome. Laugh away, my boy!

At this moment the little girl woke. Her "good-morning" was a cry.

—Come, nurse, give her the breast, said Ursus.

The little girl had sat up. Ursus took the bottle from the stove and gave it to her to suck. At this instant the sun was rising. He was just level with the horizon. His red rays entered through the glass, and struck the face of the girl which was turned toward him. The child's eyes, fixed on the sun, reflected his crimson roundness like two mirrors. The balls were motionless; the lids also.

—Why, she's blind! cried Ursus.

## THE WOMAN OF BUSINESS.

BY THE AUTHOR OF "THE BACHELOR OF THE ALBANY."

ALEXANDER was pleased with Mr. Evelyn's exterior; he was a tall man, probably over sixty; he seemed to be in feeble health, and stooped considerably; his hair was nearly white, his face long, pale, and intellectual, but its expression was amiable and benevolent, rather than suggestive of mental power or force of character. In these days he would have worn some strange form of hat, and been attired as if he wished to pass for a horse-dealer or a game-keeper, but at that time those fantastic costumes had not been introduced with which Englishmen of later years have supplied the caricaturists with such fair subjects for their pencils. Mr. Evelyn, on the contrary, was dressed with care, and much as he would have been in the same season, had you met him in Pall Mall or Regent Street; a blue frock, trousers of

nankeen (a stuff now only to be seen in the Kensington Museum), and an ordinary white hat, only that the leaf was a little broader than usual.

As to Alexander's outer man, of which as yet we have said nothing, it is enough to say now that it was in the same taste as the old gentleman's, scarcely more juvenile, but of stronger materials, more fit for hard work and vicissitudes of weather. His appearance and bearing had in turn made a favorable impression on Mr. Evelyn, but Hannah had already saved him the trouble of describing the stranger for his daughter. On that lady, however, her maid's account of Alexander, though in terms of exaggerated praise, to repay him for his civility and good offices in the affair of the eggs, was completely thrown away.

"Only think, papa," she exclaimed, advancing to meet her father from the breakfast-table, where she had been making tea, "these provoking tourists are finding out Orta at last; there are actually a pair of them, and English ones too, in the house at this instant."

"Not in the house, at all events," said Mr. Evelyn, smiling and kissing her. "One of them is in the middle of the lake by this time."

"You take it very quietly," rejoined his daughter, with a curl of vexation on her lips; "but I consider it a monstrous intrusion, I can tell you."

"Two, after all, is no such great matter," said the old gentleman, taking his seat.

"Two will bring twenty, sir. Mr. Smith and Mr. Brown are sure to be followed by Mr. Jones."

"Ay," said her father, affecting to be deeply concerned, "and then the Robinsons are inevitable. I presume the young man on the water is Mr. Smith?"

Here Hannah, who was standing by, interposed with fervor to explain that it was a much prettier name than Smith; his name was Mr. Frederick Alexander; she had seen it in the travellers' book, and his companion's name was Mr. Woodville; and Hannah took care to let her master know that but for Mr. Alexander he would have had no eggs for his breakfast.

"Come, Fatima," said Mr. Evelyn, "these are strong points in his favor: he is not Mr. Smith, and we are indebted to him for our eggs."

The outraged lady vouchsafed no reply, but packed Hannah away to inquire about the hours for posting and receiving letters, directing her to bring back the information in black and white.

"She is so inaccurate," added Miss Evelyn, when the maid's back was turned, "so very careless. Only think of her leaving behind, either at Ivrea or Chiavasso, I suppose, one of the account-books, and the Bobbio book of all others; all our disbursements in it for the schools and charities. What shall we do if it is lost?"

"It will vex you," said Mr. Evelyn, "more than it will the good folk at Bobbio. I remember an anecdote of Henry VII., who kept a memorandum-book in which he entered the daily expenses of his palace. His favorite monkey got hold of it one day and tore it up in pieces, to the inexpressible delight of the officers of his household. But your book will be perfectly safe, depend upon it; we shall find it on our way back to Turin."

"I am sure I hope so, papa; for that good old man at Bobbio has no more notion of regularity or keeping accounts, or business of any kind, than Hannah or—"

"Myself, I suppose," interrupted her father.

"Very well, papa, I never contradict you, but really these primitive Christians are very hard to manage; I was obliged to leave Bobbio, after all, without the vouchers, but I do hope the post will bring them to-day."

"You are quite right, my love, to make them mind their p's and q's."

"I am resolved they shall mind them; and now come and see how nicely I have arranged your table for reading and writing until the sun goes down a little; and you see where I am going to fix myself opposite to you."

Mr. Evelyn's table had very little of the air of business; there was a writing-case certainly, but it was not open, as if he seldom used it, and wrote most of his letters by proxy. His books and newspapers, on the contrary, were arranged before him convenient to his hand; among them were several reviews and other new publications, both French and English, all indicating the habits of an easy reading man;

the only business-like phenomenon was a bundle of papers tied with a bit of pink ribbon, but it lay at one side upon the unopened writing-case.

Nor, indeed, was there any thing ostentatiously busy or official about Miss Evelyn's establishment in the opposite corner. On the contrary, the ordinary feminine phenomena predominated. There was a little row of volumes, some of which looked like small editions of the Italian poets, others were perhaps novels. There was a small writing-desk, evidently much more used than her father's, and even a plainer one; but there was a work-basket also. The little red books on the desk labelled with the words "Torre" and "Angrogna," were probably the companions of the green one which was lost or missing.

While Miss Evelyn was carefully arranging the *jalousies*, so as to temper both the light and heat, yet so as to admit whatever air was stirring, which was not much, and also to afford a peep out on the water through the vine, Hannah returned from the post-office, and brought letters and papers with her. Among the former was a fat one from the pastor of Bobbio with the expected documents. The young lady's eye sparkled with triumph.

"You see, papa," she cried, holding them up as if they had been prizes in a lottery, "the effect my letter from Turin has produced."

"I hope it was not too sharp, my love," said the old gentleman, opening a newspaper.

"It has brought the vouchers, papa—that's the great point," she replied, as she seated herself at her little table. Then she added, after a moment's pause, "Really it is most important for their own sakes to teach these poor people a little regularity in money matters. Our fund goes much further now than it used to do, when nobody knew how the money went, as was the case a few years ago. 'On a changé tout cela,' I hope."

From that moment, for two or three hours, there passed but little conversation between father and daughter; he was engrossed with his books and newspapers, she with her Vaudois accounts. It was pretty to mark the ringed and rosy finger run up and down the columns of figures, and the musical murmur with which she carried the tens; it shed a hue of poetry over arithmetic. It was very pretty also to note her momentary embarrassments, for they were only momentary, as if she had carried over a franc or centime too much or too little, or had caught the slovenly accountants of the Protestant valleys tripping; and how the transient difficulty sometimes told on her bright, intelligent brow, clouding it; sometimes on her lips, compressing them the least possible; sometimes, but that was very seldom, going down so low as to affect the foot that peered out from beneath the sweep of her plain morning-dress (not half as smart as Hannah's), making the extreme flounce scarce rustle with its movement. It was pretty, too, when the difficulty was brushed away almost as soon as it occurred, and the light returned to her brow, and foot and flounce were still again, and to reward herself for her successful pains, or her impatience subdued, she smelled vigorously at a vase of roses which Hannah had placed at her side, or jumped up and kissed her father in the middle of his reading.

#### CHAPTER IV.—ON THE WATER.

MR. WOODVILLE was still a martyr to the cold which his stirring friend had given him in pointing out the sublimities not to be seen from the "misty mountain-top," but he was not too ill to keep his breakfast engagement, or play his part at the table with respectable efficiency. Indeed, he thought it necessary once or twice to apologize for his appetite, which he declared was a morbid and hysterical one, and no proof, as it would be with another man, of any strength or stamina in his constitution.

Woodville had the advantage of Alexander, for he had actually got a peep at the enigmatical young lady, but she was a puzzle to him also, for he could neither pronounce confidently either as to her age, or her pretensions to beauty. What he chiefly noticed was a look of decision and an air of originality which tallied with the inferences his friend had drawn.

"In short," said Woodville, "I think we may sum her up tolerably well by saying she is a pretty, clever, odd sort of a girl, with a will of her own, and a specialty for double entry."

As soon as the artist heard the name was Evelyn, he at once re-

membered that he had often heard in Paris of a gentleman of that name, who was noted for his eccentricities, the nature of which, however, he could not recall to mind.

"I doubt very much," said Alexander, "if Miss Evelyn has bestowed as much attention on us as we have upon her."

"I am positive she has not," said Woodville, "so let us follow her discreet example. Shattered as I was—you laugh, but I am quite in earnest—I made an effort this morning to make a sketch of the old man under the fig-tree, while the subject was fresh in my memory. Would you like to see it?"

Alexander thought the drawing beautiful, and truly so it was; it was just the theme which Woodville's wayward pencil handled most lovingly.

"What thought, what feeling, you have thrown into it! And, what is very strange, the old man strongly resembles my father, whom you never saw."

"It is not surprising," said the artist, "as I had your own green old age in my mind's eye. Excuse me for grizzling your hair before your time, but I often amuse myself with speculating on the future of a face or a form; to me there is as great a charm in the autumn of human life as in the autumn of the woods and mountains."

"I shall be fortunate," said his friend, "if I ever arrive at such a mellow October. But come, since you are in such a good vein for sketching, you must go on the lake with me in the cool of the day; the views will be sure to inspire you afresh, and to-night we shall have a moon."

Woodville's face prolonged itself immediately, and he shook his head dubiously; he feared it would be too much for him, that it would affect his trachea, or his uvula, or his bronchial tubes, parts of the animal machinery, of the very existence of which Alexander was in happy ignorance; but the temptation was too strong, and his friend, having prevailed, left him to himself until dinner-time.

When the hour for the water came, the Evelyns, who were also bent on the lake, were the first at the place where the boats lay, but it accidentally happened that the only boat to be had was the one which Alexander had hired.

Here was another *casus belli* against the tourists, who had monopolized the one boat.

"I told you, sir, what it would come to," said Miss Evelyn, with a sort of composed vexation, as if she had made up her mind that she was no more to be lady of the lake.

"Perhaps our hostess will be able to procure a boat for us," said the old gentleman. So they returned to the inn, and were in council with the landlady in the porch just as Alexander and Woodville were

setting out, the latter wrapped up as if the November winds were blowing. Miss Evelyn had an eye for the ridiculous; it was easy to see that, as it twinkled through the half-closed lids for the twentieth of a second upon the artist as he passed, he would certainly have made a different toilet, could he have anticipated the criticism of that rapid but comprehensive survey. With equal rapidity Alexander had perceived the difficulty the Evelyns were in, and to place his boat politely at their disposal was the affair of a moment.

Mr. Evelyn thanked him profusely, as did his daughter also, though in few words and with a little state.

"I am twice your debtor, sir," said the affable old gentleman, "for my breakfast this morning, and again for your present kind offer; but the boat is large enough for us all, and it is not unlikely that our projects coincide."

This suggestion settled the matter, agreeably to Alexander at all events, and the Evelyns led the way to the place of embarkation, where they found Woodville resting.

He was by no means so well pleased as his friend at the arrangement made behind his back; the sparkling criticism of that bright eye of indeterminate color disturbed him, and he would certainly have managed to shuffle off some of his wraps, only that unluckily his shabby old dressing-gown was under them, and to have exhibited that to Miss Evelyn would have been worse still.

"Perhaps we can dispense with the boatman," said the lady, and added, looking at Alexander, "I dare say this gentleman will have no objection to row."

Alexander took the oars not only with complaisance, but pleasure,

"On the Water."

for he was an expert waterman, and the young lady took the tiller, greatly to the artist's satisfaction, for he was afraid for a moment she was thinking of imposing the steerage on him. The young lawyer sat facing the lady at the helm, her father was at her right, and Mr. Woodville on her left, the only member of the party who was not at his ease. And yet, without intending it, he was the first to amuse the party. Mr. Evelyn was sorry to see that Mr. Woodville was an invalid, and hoped he would soon get rid of his cold, which led the artist to give an account of the way in which he caught it, which he accompanied with such a naïve description of his terrible adventures in the storm on the hills, the miseries he endured on the donkey, and the pickle he was in, how his worst apprehensions of Alpine dangers were more than realized, and how his companion only grew more and more elated and triumphant the more the horrors increased, that the Evelyns were extremely diverted—particularly the lady, who laughed heartily—at which Woodville was not at all offended, for he was not sorry to be entertaining, and was never ashamed to confess that he was no hero.

"I am afraid," said Mr. Evelyn, "we do not feel as much as we ought for what you went through; you have related it so agreeably."

"We shall be wishing you, sir, to make the ascent of Mont Blanc, or Monte Rosa," said the young lady, with a flash of pleasantry in her eye, as gracious as possible, and not a bit of the expression which had made Woodville feel uncomfortable at the door of the inn.

"Do you propose any of those gigantic expeditions?" said Mr. Evelyn to Alexander.

"Not at all," he replied; "my heroism only exists in my friend's imagination; we are of the humblest class of tourists; we have crept through Switzerland, and are now creeping through the north of Italy, intending to creep homeward toward the end of September."

"To give you a notion," said Woodville, "of what Mr. Alexander understands by creeping, you have only to look at that enormous mountain yonder, over which we crept, as he calls it."

"The highest positions in life are often gained by creeping," said Mr. Evelyn, whose style of talk was rather pretentious; "I have seen many instances of it in my time; but I venture to predict that is not the way the gentleman rowing will make his way in the world."

Alexander thanked him laughingly for the flattering remark, and he might have thanked his daughter too for the smile with which she supported it. Indeed, she spoke little, though she evidently enjoyed the water and the surrounding beauties extremely, but it was in a reserved and demure way; there was no more of the enthusiastic burst of the morning.

Mr. Evelyn ran on upon the different ways of rising in life; how few rose by straightforward, manly climbing; how many by servile crawling or wriggling, which he illustrated by the fact that even the eel, not a more slippery creature than many an eminent politician, will wriggle itself up a ledge of rocks or a salmon-weir. He had seen men in his time who wriggled themselves into bishoprics, and even higher positions.

Woodville was now so much at his ease that, after looking at his watch, he produced a minute phial of globules, no bigger than the heads of pins, and, having dropped a certain number into the palm of his hand, licked them up with an apology—much called for—for taking medicine in company. He did not see, but Alexander did, how Miss Evelyn looked while he was taking his dose. It was another of those little flashes of sarcasm darting out between the half-shut eyelids, which she had levelled at the artist's wraps.

"You are not a homœopathist," said Alexander, addressing her. The look made that plain enough.

She answered the question only with a slight negative movement of her head, as if she desired to avoid a discussion of the subject; but the old gentleman went off fluently on the virtues residing in molecules and infinitesimals, from which he dashed into the atoms of Epicurus, quoted Lucretius, and displayed a wonderful deal more learning than was level to the comprehension of his audience, or exactly in place in a boat on the lake of Orta. It was evident he plumed himself on his talk, and talked to be admired. The young men soon perceived that they had only to listen respectfully to make themselves perfectly agreeable. When he came to his first pause, Woodville ventured a complimentary remark upon the wide range of his reading. This opened a new theme, on which Mr. Evelyn expatiated again with

the same fluency. He disparaged extensive reading with a fresh outpouring of it.

"Learning, Mr. Woodville, you know as well as I do, is the vainest of all vanities. What signifies being 'deep-versed in books,' if a man is 'shallow in himself,' as Milton puts it? And how well Shakespeare expresses the same thought—

'Small have continual plodders ever won  
Save base authority from others' books.'

But what long ago most thoroughly disgusted me with your prodigies of erudition, was an opinion I met in the works of one of the fathers of the Church, that the most ignorant devil has more learning than the most learned man that ever lived."

This quaint theological dictum made everybody laugh, and, before the laugh was over, Mr. Evelyn had started again on the subject of demonology, with which he seemed also to have the most intimate acquaintance, quoting the Bible, the Koran, and the Talmud, and twenty authors of whose very names Woodville was ignorant, and he knew rather more about books than his friend.

When the demons were exhausted, he stopped to take breath. The young men could see that though his daughter was proud of her father's talents and knowledge, she did not encourage him to talk—probably because he talked a great deal more than was good for him, as he seemed troubled with a dry, short cough. But he wanted no encouragement, only an audience, and, having now that advantage, he seemed determined to turn it to account. Though he had talked so much, he had not yet mounted his hobby, which had been, for some years, the cause of the Vaudois. The moment he got astride of that he became not only fluent but rhetorical, and gesticulated with his hands as if he had been speaking from a platform.

As he spoke of the glorious struggles of the people of the Valleys against the House of Savoy, and of the deeds of their heroic leaders, especially Henri Arnaud and his romantic career, he was really "the old man eloquent" for a few minutes. His eye gleamed with some of the fire of the contest he painted, and Alexander suspended the oar to listen to his impassioned strain. Woodville, always excitable, forgot himself to the point of half-revealing his old *robe-de-chambre*, and, as to Miss Evelyn, she listened with an admiration and a sympathy which she had not vouchsafed to her father's display of learning.

But the pitch was too high to be long maintained, and he was soon in a more prosaic region again, beginning to enlarge on the difficulty of managing charitable enterprises so as not to destroy the spirit of independence in the objects of our benevolence.

"How often," he said, "do we corrupt poverty when we flatter ourselves that we are relieving it! Charity must keep a close hand. We always try to make ours do so in the Valleys. I dare say, gentlemen, it would interest you to know how we manage our fund?"

"But don't you think, papa," interrupted his daughter, biting her lip ever so little, "it would be more interesting just now to land and observe the sunset?"

Alexander instantly pulled toward the island.

"Just as you please, my dear," said Mr. Evelyn. "I will take another opportunity of giving our friends an outline of our system—or rather *your* system."

Miss Evelyn bit her lip again, but it was impossible to arrest his volubility.

"She is our accountant," he pursued; "we leave all the financial department to her. You see a young lady before you unversed by multiplication, unpuzzled by the rule-of-three, and unmaddened by fractions. I wish I could say that business perplexed me as little as it does her."

Alexander, whose eye was as quick as any lady's, saw how little this comical eulogy pleased Miss Evelyn, though she affected to laugh, which was the best thing she could do; so he made as if he was too intent on the oar to pay much attention to what the old man was saying, and, with a few strong pulls, brought the boat to the foot of a flight of steps, and the conversation, at the same time, to a full stop.

As they mounted the marble stairs, Miss Evelyn took her father's arm, and murmured something in his ear, probably a request that he would not resume the subject of her skill in accounts before the strangers.

At least there was no more of it. Mr. Evelyn having talked himself out, now allowed his new acquaintances to talk, possibly wishing to know more about them; and Woodville was as communicative as

the most inquisitive old gentleman could have desired, and left very little untold about himself and his complaints, and then about his friend, and his talents, and his prospects, until Alexander was in the situation which Miss Evelyn had been in before, of feeling himself made slightly ridiculous by excessive praise. But, as he had helped her, so she now helped him in turn, by remarking that they had sat too long on the cold marble; particularly, she added (with a sly hit at the artist's envelopings), as her father was not so well fortified as Mr. Woodville.

"Come away, sir," she said to the old gentleman; "let us be merry and wise; if you catch cold, you will never be able to keep your appointment next week at Turin."

"Don't mention it, don't mention it," said Mr. Evelyn, with a sigh, as if the business alluded to lay heavily on his mind. His daughter folded carefully around him a plaid shawl which she had brought with her, took his arm in hers, and led him away to the boat.

It was full time for invalids and old men to get home, for the twilight was over, and the owls from the old towers of San Giulio were beginning to hoot.

## TO THE CENTRE OF THE EARTH.

**A**MONG the most popular of all the modern writers of France, in his way, is Jules Verne, who, for three or four years past, has been solving that difficult problem of "combining instruction with amusement," in the most adroit and successful manner.

The first of his peculiar books, "Five Weeks in a Balloon," has been translated in America. His second production, entitled "A Trip to the Centre of the Earth," is now before us, and, as a scientific fantasy, we find it sufficiently peculiar, original, and amusing.

Monsieur Verne makes travelling companions of wit and erudition, and, while satirizing the wild vagaries of mere theorists, manages to convey a vast amount of practical instruction and adorn his pages with some of the most vivid and striking descriptions of things known and unknown, possible and impossible, that the imagination can depict.

The wild life and scenery of Iceland he makes a fitting preliminary to the descent of his heroes toward the earth's centre, through the open crater of an extinct volcano, and then follow "hair-breadth 'scapes and ventures perilous" without number in the vast interior world, where they find an electric sky electrically illuminated, and vast seas, plains, and mountains, covered with antediluvian growth, and peopled with monsters who disported on the surface of our planet before the Flood. Then ensue terrific tempests; combats of the pre-Adamitic wild beasts on land and water, and, after nameless vicissitudes, the escape of the travellers upward to the surface again, through an active volcano, in another quarter of the globe.

That M. Verne has secured sufficient room for the play of his imagination, in this work, will hardly be contested, and, at the same time, he has manifested profound scientific erudition, as well as sparkling and playful fancy.

But, in order that our readers may have a foretaste of this curious literary freak, which has amused so vast a host of scientific and unscientific people in Europe, we briefly introduce and quote a few passages. These are taken almost at random, however, for the book is equally bizarre throughout.

The story—for a story is made the graceful connecting thread that holds the incidents together—opens in the queer old city of Hamburg, and introduces us to Professor Lidenbrock, an enthusiastic antiquarian and naturalist, and Axel, his nephew, a roguish youth, whom the professor is trying to train up in the path of science, but who has a much more decided tendency to fine clothes, sunny promenades, and a certain little Graüben, his cousin, and Lidenbrock's niece. Axel and Graüben are both in their teens, and their mutual tenderness has only just reached the pastoral stage when the professor becomes deeply engrossed in some new investigation that upsets all his usual ways and habits, vastly tribulates old Martha, his sexagenarian housekeeper, and overclouds Master Axel's felicity, by giving him musty work to do in the library and study.

"This study," writes Axel, who is supposed to offer us the whole narration, "was a veritable museum. All the specimens of the min-

eral kingdom were there ticketed in the most perfect order, according to the three grand divisions of inflammable, metallic, and lithoid minerals. How well I knew all those epitomes of mineralogical science! How often, instead of frolicking with boys of my age, I had amused myself with dusting those graphites, those anthracites, those fossil coals, those lignites, those fragments of peat and turf! And then there were the bitumens, the resins, and the organic salts, that had to be kept clear of every atom of dust. And the metals, too, from iron to gold, the special importance of which disappeared in the absolute equality of value prevailing among scientific specimens. And all those stones that were in quantity enough to rebuild our old house in Königstrasse, and even add a handsome room to it, which would have suited me so well!"

It will be seen that, after all, Axel had some scientific preparation, but the chief object before him during the visit to the study, which he selects for the above description, is his uncle, Lidenbrock, who is there going into ecstasies over a strange-looking old book that he has just brought home from the stall of the Jew Hevelius; for the professor is a bibliomaniac along with his other accomplishments.

"See," said he, carrying on all the questions and answers himself; "isn't it a beauty? Yes, it is admirable. And what binding! Doesn't that book open easily? Yes, and it stays open at any page you please. And, doesn't it shut well? Yes, indeed; for the cover and the leaves are perfectly secured together in one compact whole, without separating or gaping at any point. And its back without a crack in it, after seven hundred years of use! Ah, there's a binding that would have been the pride of Bozerian, Closs, or Purgold!"

This remarkable old volume, with its tough leather back, and a faded seal dangling to it, turns out to be no less a treasure than the far-famed "Heims Kringla" of Snorre Turleson, the renowned Icelandic author who flourished in the twelfth century. This was his Chronicle of the Norwegian Kings who had reigned in Iceland, and it was, from beginning to end, a manuscript in pure Runic, the characters of which, as tradition runs, were invented by Odin himself.

While overhauling this wonderful tome, the professor sees a great parchment drop from it, and, in a moment, has unfolded it with eager haste. It was a slip of sheepskin, five inches long and three in breadth, with a series of outlandish characters imprinted on it in transverse lines.

These the professor discovers to be Runic also, and identical with the letters of the "Heims Kringla." To decipher them was the next problem, and poor Martha announcing dinner, and Axel pining for Gretchen, are the immediate victims of this scientific passion. The professor will see nobody, listen to nothing, eat not a bite, until that problem shall have been solved. Axel is planted at a table, pen in hand, and ordered to put down, in plain letters, his uncle's first reading of the puzzle, as below:

<i>m.rnlls</i>	<i>esreuel</i>	<i>seecJde</i>
<i>sgtsemf</i>	<i>unteief</i>	<i>niedrke</i>
<i>kt,samn</i>	<i>atrateS</i>	<i>Saodrrn</i>
<i>emtnaeI</i>	<i>nuacct</i>	<i>rrilSa</i>
<i>Atvaar</i>	<i>nascrc</i>	<i>icaabs</i>
<i>ccdrmi</i>	<i>ceutul</i>	<i>frantw</i>
<i>dt,iac</i>	<i>ossibo</i>	<i>Kedilil</i>

The professor finds that this writing is a *cryptogram* written late than the book, since it contains the double *M*, which is of more modern invention, and can be found nowhere in the volume. "At least two centuries' difference in date," he says. On further investigation, he discovers, to his great delight, a signature to the MS., also in Runic hieroglyphics:

1h h + 41K h A 44 + \*

Arne Saknussemm! a celebrated Icelandic sage and alchemist of the sixteenth century. The cryptogram assuredly conceals some remarkable discovery, for those alchemists, after all, were the only true savants of their period—Avicenna, Bacon, Lullius, Paracelsus, and the rest, bearing witness.

The professor finds even his vast erudition a little at fault in the presence of these one hundred and thirty-two letters, embracing seventy-nine consonants and fifty-three vowels, thrown together in apparent disorder, but really arranged with mathematical forethought, and from certain indications believed to be Latin, but illegible without

a key. What is that key? The professor, cudgelling his own brains to find it out, also sets poor Axel to work instead of letting him go to his dinner. His first idea is to write down any sentence, with the letters arranged in perpendicular instead of horizontal lines, and so detect their relations as vowels and consonants thrown into a heap. This he directs Axel to do. That enamoured youth happens at the moment to be thinking more of his pretty Graüben than of Arne Saknussem, and writes, as requested, the first thing that occurs to him. Here is the result:

O, e e, l ü  
I y a l e b  
l o r i G e  
o u l t r n  
v d y t a !

The next process was to write the words as they were thus formed, horizontally, and they read :

O e e, l ü—I y a l e b—l o r i  
G e—o u l t r n—v d y t a !

The professor was delighted. There, he said, was a confusion of consonants, and a mingling of points and vowels, quite Runic. So, snatching the paper, he read the columns up and down, and much to his amazement came upon the following disclosure, which the reader can make out for himself :

"O, I love you dearly, little Graüben !"

This is a new phase of the business, and sets the wise man of Hamburg to thinking ; but the inscription must be made out, at all hazards, and Lidenbrock, after working until his head aches, rushes from the house and leaves Axel to finish. Our youthful friend worries at the MS., turning it in all directions. At last, a fortunate sidelong glance reveals the run of the letters, and there is a general jubilee when the professor returns. They have the key, which is, to read the legend backward ; and here it is in ancient Latin :

"In Sneffels Yoculis craterem kern delibat umbra Scautaris Julii intra kalendas descende, audas viator, et terrestre centrum attinges. Kod feci Arne Saknussem."

And this is the translation :

"Descend into the crater of the Yokul of Sneffels, which the shadow of Scautaris caresses, before the kalends of July, O daring traveller ! and you will reach the centre of the earth. Which I did. Arne Saknussem."

This was enough ! from that moment, no peace in the house until Lidenbrock's trunk was packed, and he, with poor Axel, whom the uncle's inexorable will tore from the arms of the weeping Graüben, was on his way to Iceland, to reach it before the "kalends of July."

At Copenhagen, Uncle Lidenbrock makes Axel "take lessons of the abyss," as he styles them, by causing him to ascend the loftiest steeples and hang over the balustrades.

At length they embark for Reikjavik, and, after a quaint voyage as quaintly told, enter their destination, the bay of Faxa, and see the designated snow-clad mountain towering in the distance.

Iceland life, manners, and scenery, now come in, and the theories on both sides concerning the hollowness *versus* the fiery fulness of our terrestrial globe are laughably disowned. The professor believes in Saknussem's story and determines to equal his achievement, or perish in the attempt, and poor Axel must accompany him.

After a curious trip from Reikjavik to the top of Sneffels, where they arrive at the right time, they discover an ancient monument weather-beaten and gray with time, on which once more in Runic characters is carved the name of Arne Saknussem. Axel is in despair at this confirmatory evidence, but old Lidenbrock is enchanted, and after dismissing all their Iceland guides, excepting Hans, a faithful native boatman, they prepare to descend into the crater.

Here begins the subterranean journey ! Axel describes the first part of the descent from the inner orifice at the centre—or, in other words—the throat of the crater.

"Its sides, which were almost perpendicular, still offered many jutting points that would aid the descent ; but, if the stairs were there, the balustrade was completely lacking. A thick cord attached to the mouth of the hole might, indeed, help us ; but how were we to loosen it again when we got to the end of it ?

"My uncle employed a very simple device to overcome this difficulty. He unwound a small rope about as thick as one's thumb, and four hundred feet long. He ran out about one half of it, and then, fastening it around a projecting point of rock, threw the other half dangling into

the throat of the crater. Each of us then could descend by taking the two halves of the rope in our hands and supporting himself as he passed down along them, since they were securely fastened in the middle. Once safely landed two hundred feet down, it would be easy to recover the whole cord by releasing one half and hauling on the other, and so on *ad infinitum*."

The baggage was divided into three parcels, Axel and the Professor each putting one on his back, Hans the Iclander taking charge of the heavy tools and implements, and the third bundle being simply "dumped," or dropped, from point to point, as it had nothing fragile in it.

The journey, arranged on these highly scientific principles, at once began. The first day was spent in descending to the bottom of the round neck of the crater. This they reach at last, after ten and a half hours of "abyss gymnastics," and discover, at a depth of twenty-four hundred feet, a side gallery of fair dimensions gently sloping downward to the right.—Here they make their first resting-place, and pass a peaceful night.

The professor is charmed, the Iclander quite contented, and even Axel begins to enter into the spirit of the thing.

Their first regular data are noted down, next morning, as follows :

MONDAY, July 1.—*Chronometer* : 8h. 17m., A. M.

*Barometer* : 29p. 7l.

*Thermometer* : 6°.

*Direction* : E. S. E.

To follow the journey fully, one must get the book, and sooth, to say, Jules Verne rivals the Arabian Nights in his descriptions of the innermost subterranean world. The homes of the genii and the caverns of Eblis are totally eclipsed by the natural halls and palaces, grottos and domes, that our travellers find and classify according to pure geologic science.

We can cull but a page or two as we hurry onward :

"The electric light sparkled gorgeously on the schists, the lime crystals and old red sandstone of the walls. We might have fancied ourselves in some excavation in the midst of Devonshire, which has given its name to these peculiar deposits. Specimens of magnificent marbles incrustated the walls, some of gray agate with white veins capriciously etched in them, and others flesh-colored or of bright-yellow speckled with red flakes, and, farther on, varieties of sombre egriot, in which the calcareous formations stood out in vivid tints."

At length, as they press farther on, they plunge down, down by a spiral winding way into the primitive deposits, their gallery growing broader and brighter, but the heat increasing, and their supply of water giving out. The professor, however, has strength and courage for all emergencies, and sustains the drooping spirits of his companions. The desperate hunt for water, the cutting through of a granite wall to reach it, and their wild enjoyment when it is found, are superbly narrated. Hans, the stolid, steady, brave, untiring Iclander, is a great character, in his way, and the reader gets attached to him.

Their road now lies along spirals, horizontals, and verticals, but downward, ever nearer to the centre.

On the 15th of July they were twenty-one miles beneath the level of the surface seas, and in the finest health and spirits. On the 18th they were two hundred and fifty-five miles southwest of the base of Sneffels, and forty-eight miles in perpendicular depth, or at the limit of the crust assigned to our planet by some astronomers. Of course, they were living witnesses of the erroneous deductions that ascribe a heat of fifteen hundred degrees to that depth !

Axel gets lost by branching into the wrong descending gallery, and here the author has an opportunity to put forth fancy and science together, in a series of intensely dramatic episodes. He does it, we need hardly say, with fine effect, and, at length, after thrilling perils, the party is safely reunited.

We cannot refrain from citing a paragraph of description, from the chapter where their arrival in the *interior world* is richly detailed :

"A vast sheet of water, the beginning of a lake or an ocean, extended beyond my range of vision. The shore, which was deeply indented with bays and inlets, received the last caresses of the waves on an expanse of fine sand sparkling with golden light, and bestrawed with those little shells in which the first beings of the creation lived. The billows broke upon it with the sonorous murmur peculiar to immense enclosed spaces, and a light spray, tossed by

the caprice of a playful breeze, flecked my face. Upon this slightly-sloping beach, at about one hundred fathoms from the margin of the waters, the last spurs of enormous rocky ridges shaded off and disappeared in the level, while the gigantic masses behind them ascended to immeasurable heights. Some of them, rending the shore with their sharp crests, formed capes and promontories gnawed by the teeth of the surf. Farther on, the eye could trace their huge outlines clearly profiled against the misty background of the horizon.

"It was indeed an ocean, with the capricious contours of terrestrial coasts, but solitary and fearfully wild of aspect.

"If I found no difficulty in surveying even the distant features of this scene, it was because a very peculiar light illuminated its minutest details. It was not the light of the sun with its brilliant sheaves of glowing beams and broadening golden rays, nor the vague and pallid sheen of the satellite that merely reflects his splendor without his heat! No! The illuminating power of this light; its tremulous diffusion; its clear, dry whiteness; the slight elevation of its temperature; its brightness, in reality superior to that of the moon, indicated a purely electric origin. It was a sort of continuous aurora borealis, or some such cosmic phenomenon, that filled this cavern, huge enough to hold an ocean.

"The vault that hung over my head—the sky, if you will call it so—seemed to be made up of immense clouds, or movable and changing vapors, which, no doubt, by the effect of condensation, descended at stated periods in torrents of rain. I would have thought that under so strong an atmospheric pressure, the evaporation of water could not take place, and yet, by some natural reason that escaped me, there were heavy clouds suspended in the air. But it was 'fine weather' at the time. The electric flashes produced the most surprising play of light on the far-up clouds; intense shadows describe themselves on the lower volutes of these cloudy pillars, and, from time to time, a ray of remarkable power would dart through to us between two disjointed masses. But, still, this was not the sun, for there was no heat with its light, and the effect was dull and profoundly saddening. I felt above me, instead of a glittering firmament of stars, a granite vault beyond those clouds, crushing me down with all its weight, and not yielding space enough, vast as it seemed, for the least ambitious of the satellites."

It was like a weird sojourn in some distant planet, this visit to the central world! But the sky and light were no stranger than the *flora* and *fauna* of the place. Forests of mushrooms, as tall as earthly palm-trees; lycopodia, one hundred feet high; arborescent ferns, as lofty as our pines—in fine, all the plants of the second cosmic period, or period of transition, were there; while the bones of the mastodon and the megatherium lay scattered about.

However, there were living creatures as well as fossils in their neighborhood, and something still more interesting, as we are told in the subjoined paragraphs:

"Suddenly, I halted, and laid my hand on my uncle's arm to hold him back. The diffused electric light enabled me to distinguish the smallest objects in the depths of the thickets. I had thought that I saw—No! really, I *did* see huge shapes moving under the trees. Yes; there were gigantic animals, a whole herd of mastodons, not fossil, but alive, and like those of which the remains were found in the

swamps of Ohio, in 1801. I could perceive the trunks of these enormous creatures twisting in and out under the trees like a legion of serpents, and I could hear the sound of their long tusks, as their ivory points tore the old bolls and branches of the trees. The boughs crackled, and masses of foliage stripped from them rapidly disappeared down the throats of the immense animals."

The uncle, undismayed, as ever, proposes to push on through the antediluvian forest, but is restrained by Axel, who remarks that no human being could brave the wrath of such monsters.

"No human being?" responded the doctor, lowering his voice. "You are mistaken, Axel. Look, look yonder! I think I see a living being, a creature of our own species—a man."

"I looked, with a shrug of the shoulders, however, and determined to push my incredulity to the last extreme. But, in spite of myself, I had to yield to the evidence before me; for there, about a quarter of a mile from us, leaning on the trunk of an enormous cowrie-tree, was a human form, a Proteus of these subterranean regions, a new son of Neptune, tending the numberless troop of mastodons.

"*Immanis pecoris custos, immanior ipse!*"

"Yes, *immanior ipse*. We no longer had before us the fossil man whose remains we had previously discovered among the other bones, but a giant fit to master the monsters around him. His stature surpassed twelve feet. His head, which was as large and massive as that of a buffalo, was nearly hidden by dishevelled masses of unkempt hair. It might have been called a regular mane, like that of the primeval ages. He brandished a huge bough, that seemed a befitting crook for this antediluvian shepherd.

"For a moment we stood there stupefied and motionless. But the giant might see us—prudence dictated immediate flight.

"Come, come!" I exclaimed, dragging my uncle away; and, for the first time, he consented to be overruled.

"A quarter of an hour later, we were out of sight of this very formidable enemy."

But their experience of the antediluvian life was not to be limited to skeletons of the huge creatures that had roamed in those days; having built a raft of fossil wood not yet mineralized enough to sink, the party embark on the interior ocean, and are caught in a terrific electrical storm.

Here comes in a grand description, which the limits of our sketch will not permit us to reproduce. But the most striking episode of all is a fearful combat, of which they were made the unwilling witnesses. They have caught all kinds of antediluvian fish, and had their best iron anchor gnawed by the still harder teeth of submarine monsters, worse than any that have challenged the pen-provess of Victor Hugo. At length, they come to this:

"Tuesday, August 18th.—Evening came, or, rather, the moment when drowsiness weighed down our eyelids, for there is no night on this ocean, and the pitiless light continues to fatigue our eyes as though we were sailing under the sun of the Arctic seas. Hans was at the helm, and during his watch I fell asleep.

"Two hours later, a terrible shock awoke me. The raft had been lifted out of the water with tremendous force, and flung twenty fathoms away.

"What's that?" asked my uncle, hurriedly. "Have we struck?"

"Hans pointed to a blackish mass, rising and falling on the waves, two hundred fathoms from us. I looked and shouted in a breath,

Their Road now lies along Spirals.

"'It's an enormous bear!'

"'Yes,' assented my uncle; 'and there, look! is a monstrous sea-lizard.'

"'And, farther on, a tremendous crocodile! See its huge jaws and the rows of teeth in them! Ah! he's off!'

"'A whale! a whale!' exclaimed the professor. 'I see his immense fins and tail. Look at the air and water he throws from his nostrils!'

"In fact, there were two tall columns of spray shooting up above the surface of the sea. We sat there dumb, astounded and terrified at the sight of this troop of marine monsters. They were of supernatural dimensions, and the least of them could have crushed the raft to atoms with a single touch of his teeth. Hans wanted to put the helm hard down and get out of so dangerous a neighborhood as soon as possible, but, on looking around, he saw, in the other quarter, enemies just as formidable, and, among them, a tortoise forty feet broad, and a serpent thirty feet long, darting his head above the waves.

"It was impossible to escape. The reptiles approached; they whirled about the raft with a speed which the swiftest railway-trains could not rival, tracing concentric circles nearer and nearer as they did so. I had caught up my rifle. But what effect would a bullet have upon the scales that covered the bodies of these animals?

"We were mute with terror. The monsters came closer and closer—on one side the crocodile, on the other the serpent. The rest of the troop had disappeared. I was about to fire, but Hans stopped me with a gesture. The two creatures passed at a distance of fifty fathoms from the raft, rushing at each other, and their fury prevented them from seeing us at all.

"The combat was joined a hundred fathoms from us, and we could distinctly see the two monsters struggling with each other.

"But it seemed to me that now I could observe the other animals coming to take part in the fight—the bear, the whale, the lizard, and the tortoise, for I caught a glimpse of them every moment. I pointed them out to the Iclander. But he shook his head dissentingly and murmured:

"'Tva.'

"'What! only two?' I shouted. 'He says that there are only two animals yonder—'

"'He is right!' exclaimed my

A Proteus of the Subterranean Level.

An Explosion.

uncle, who had kept his spy-glass to his eye all the time.

"'Incredible!' I retorted.

"'Yes! but true; for the first of those monsters has the muzzle of a bear, the head of a lizard, the teeth of a crocodile, and that is why we were mistaken. It is the most formidable of all the antediluvian reptiles—the *ichthyosaurus*!'

"'And the other?'

"'The other is a serpent, concealed in the shell of a tortoise, the first creature's dreaded enemy, the *plesiosaurus*!'

"Hans had been right. There were only two monsters agitating the waters, and I had before me the most frightful denizens of the primitive oceans. I could see the blood-red eye of the *ichthyosaurus* as large as a man's head. Nature bestowed upon that monster an optical apparatus of extreme power, capable of resisting the pressure of the water at the great depths it inhabited. It was very properly called the whale of the saurians, for it had the speed and dimensions of the real whale. The one before me did not measure less than one hundred feet, so far as I could judge of his size when he threw the vertical fins of his tail high out of the water. His jaw was enormous, and naturalists assign to the species not less than one hundred and eighty-two teeth.

"The *plesiosaurus*, a serpent with a cylindrical trunk, had a short tail and claws or flippers, arranged like oars. His body was entirely covered with a shell, and his neck, which was as flexible as a swan's, stood up erect thirty feet above the waves!

"These monsters attacked each other with indescribable fury, throwing up a swell on the surface that reached the raft, and tossed it with such violence, that twenty times we were on the point of upsetting. At last we heard hissing sounds of the most unparalleled intensity. The two creatures were in the death-grapple. They were so twisted together, that we could not distinguish them, and we had every thing to fear from the rage of the victor.

"One hour—two hours passed. The struggle continued with the same fury. The combatants approached the raft and receded from it, by turns, while we remained motionless but ready to fire.

"Suddenly, *ichthyosaurus* and *plesiosaurus* disappeared, making a veritable maelstrom in the waves at the spot where they went down. Many minutes elapsed without our

seeing them again. Was their combat to terminate in the depths of the sea?

"All at once, a huge head darts above the surface. It is that of the plesiosaurus. The monster is mortally wounded, and now we can perceive only his enormous shell, but his long neck rises, falls, comes up again, bends, writhes, and lashes the waves like a tremendous whip. The water was dashed in foam and spray to a great distance. We were blinded by it. But, at length, the agony of the reptile was nearly over, his motions relaxed, his contortions died away and his long serpentine body lay stretched out an inert mass upon the surface of the sea, which was now permitted to subside into its ordinary calm."

After an episode so agreeable as this, the landing upon any shore was not to be despised, and our travellers were in high spirits when they at length reached the farther limit of the great central sea.

They find a continuation there of the arched way that they had left on the other side, and conjecture that it is the proper passage for them to follow. But, it is blocked up by a fallen bowlder, which they proceeded to mine and blast with a tremendous charge of gun-cotton. Professor Lidenbrock and Hans have placed themselves upon the raft close to the neighboring strand, while Axel lights the match of the blast they have prepared. Axel then joins the rest of the party and the raft is swiftly paddled to a distance from the opening. The professor held his watch in his hand.

"Five minutes more!" said he. "Four more. Three more."

"My pulse was 240 per minute!"

"Two more! One! Crumble, ye granite mountains!"

"What occurred at that moment? As for the noise of the explosion, I don't think that I heard it; but the conformation of the rocks suddenly changed while I gazed at them, and opened like a curtain. I saw a fathomless abyss yawn wide in the middle of the shore, while the sea, taken on the instant with a vertigo, was, in a moment, but an enormous billow, on whose crest the raft stood up perpendicularly."

The blast had not only blown away the rock that blocked the passage, but had burst through a partition that separated the waters from some tremendous chasm below, and raft, travellers, sea, and all rush down into it together.

This leads to the last stage of this highly picturesque journey, and in order that such fair beginnings should not end more tamely, the professor and his companions are finally cast forth from the mouth of the active volcano of Stromboli!

When they get back to Hamburg, the general winding-up of the journey is hugely pleasant, and the joyous Axel recounts it in his own fashion:

"From that day forth," says he, "my uncle was the happiest of savants, and I the happiest of men, for 'Graüben,' my pretty Virland girl, abdicating her position as a mere pupil, took her rank in the house in Königsstrasse in the double quality of niece and wife. It is useless to add that her uncle was the illustrious Professor Otto Lidenbrock, corresponding member of all the scientific, geographical, and mineralogical societies of the five divisions of the globe."

Our readers have made many more tedious jaunts and with infinitely less amusing episodes and solid instruction than they would find with such a companion as Jules Verne in a "Trip to the Centre of the Earth."

## RUSSIAN POPULAR LEGENDS.

BY W. R. S. RALSTON.

WHEN the autumn has passed away, and the long winter evenings are at hand, the younger inhabitants of every Russian village begin to organize a series of social gatherings. During the fine weather they are in the habit of meeting out of doors for the strange mixture of grave dance with wailing song, styled the *Akorved*; but when the days become short and the air grows chill, they exchange that diversion for the livelier entertainment of the *Posidylka*. In this all the young men and maidens of the village share, meeting together in each other's cottages by turns, nominally for the purpose of carrying on some description of handiwork, but really by way of passing a sociable evening. Married people are excluded from it, as dull and prosaic companions, and the young folks devote their energies to making the hours fly fast, passing the time in singing, dancing, and story-telling. The Russian peasant seldom indulges in very demonstrative

gayety; but there is no lack of merriment within the cottages in which these *Posidylki* are held, poor as they generally are, and dimly lighted by pine splinters, and depressing as is the scene outside, when the landscape, far as the eye can see on every side, is one dreary waste of level snow, and the only sound which breaks the silence of the night is the melancholy howling of the wolves.

At such meetings as these, the *skazka*, or tale, is in great request, varied by the proverbs, riddles, and sage sayings of which the Slavonic peoples possess so rich a store. Of these tales several collections have been made, which possess no slight interest, especially for students of folk-lore. The stories told at the winter evening gatherings of the young people are for the most part, as might naturally be expected, of a light and lively cast; but those which exist in the memories of their seniors are of a more varied nature, and serve to illustrate many a point in the Russian peasant's career, many a turn in his way of thinking. And in no country have greater pains been taken than in Russia to collect and preserve these fragments of popular fiction, many of them highly valuable relics of a past age, and nowhere has research proved more successful. Some of the collectors, such as MM. Maksimof, Yakushkin, Bezsonof, and others, have carried their enthusiasm so far as to go wandering about the country in the guise of pedlars or of peasants, in order that they might gain the confidence of the common people, and induce them unreservedly to produce their hoarded treasures of legend and of song. For the Russian moujik is of a somewhat suspicious nature, and he is little inclined to open his heart to strangers who do not belong to his own class.

From the stories in prose and in verse thus gathered together, several distinct collections have been made and published. That of the *Builini*, or historic poems, alone fills five large volumes. Another, also in several volumes, is devoted to the songs of the mendicant minstrels who wander about the country, singing them along the high-roads, and in the peasants' huts, and especially at church doors, where they congregate on Sundays and saints' days after the services are over. This work is the more interesting, inasmuch as it contains the music of many of the songs, and faithful portraits of some of the singers. And of the *Skazki*, or prose tales, a collection in eight parts has been published by M. Afanasef, one of the most zealous among the students of this branch of Russian literature.

On the *builina* we do not propose to dwell at present, the subject being one which is chiefly interesting to antiquarians; and of the *skazka* it is not necessary to say much, as it has already been to some extent represented in our literature. Some years ago a number of *skazki* were translated into German by M. Anton Dietrich, and his work, for which Jacob Grimm wrote an introduction, soon afterward appeared in an English dress. But there is another class of popular tales, that devoted to subjects in some way connected with religion, and it is to this that we now propose to call the reader's attention.

The *skazka*, or tale, and the *piema*, or song, date from prehistoric and heathenish times, but the *legenda*, or serious legend, and the *stikh*, or religious poem, have, in most cases, been composed since the introduction of Christianity into Russia. Sometimes, however, the influence of the older form of belief is clearly perceptible in them, their incongruous nature showing that they were moulded or modified during that period in which the Russians were styled by their old annalist a "two-faithed" people. In accordance with the teaching of the Church, the pagan *skazka* sometimes passed into the Christian *legenda*, and the *piema* into the *stikh*; but the utterances of these proselytes were not always either as orthodox or as edifying as might have been desired. For a specimen of the confused ideas they inculcated with respect to sacred history, we may refer to the legend of Just Noah.

Originally, it says, the garden of Eden was placed under the care of a blind man and a man without hands. But the devil came and induced them to rob the apple-tree which was there, telling the handless man to shake it, and the blind man to feel about for the fallen fruit. Then the Lord came and turned them both out of Paradise, and afterward created Just Noah, "that there might be justice in the world." And the dog was set to watch over Noah, and to prevent any one from seeing him. But the devil came and insisted on looking at Noah, saying to the dog, which had been created without hair, "I will give you a warm coat; the winters will come, the frost will set in, but you will not then want a house to live in." So the dog received its coat, and let the devil look at Noah. Then the devil spat over Noah, who became "blue, and green, and miserable—a sight to look at." On that account the dog was cursed, and forbidden ever to enter a

church—a prohibition which holds good to the present day. The legend goes on to relate how Eve was created from one of Noah's ribs, and how she induced him to taste forbidden fruit, and how he and she were in consequence driven out of Paradise; how, afterward, the Lord told Noah that in three years a great flood would take place, and commanded him to make an ark. Noah obeyed, and worked hard for two years and a half, at the end of which time the ark was finished. The devil was completely puzzled, but at last he went to Eve, who was also very curious to know what her husband was doing, and told her how to act. So when Noah came back from his work, and asked for something to drink, she gave him strong kwass, and he became garrulous, and told her what he was engaged upon. The next morning, when he went to look at his work, he found that the devil had knocked it to pieces. So he had to begin all over again. When it was finished, the flood came, and the devil was very anxious to get into the ark. This he knew he could not do unless Noah should happen to swear. So he again enlisted Eve's services, and induced her to be so late in embarking, that Noah lost his temper, and swore. Immediately the devil jumped on board, in the form of a mouse. Getting into a dark corner, he gnawed and gnawed until he had made a hole in the timbers. The ark must have foundered, had it not been for the hedgehog, which stuffed up the leak with its head—on which account it is honored by the people in Russia to this day—and ultimately the whole party, the devil included, came safely to dry land.

If the whole of M. Afanasef's collection had been of as little edifying a nature as this legend, the opposition offered in some quarters to its publication might not have been unreasonable. But the legends included in it seldom deal with sacred history, and they generally convey a tolerably respectable moral. The duty on which they lay most stress is that of being charitable, and their favorite topic is the different manner in which Providence deals with benevolence and churlishness. As a good specimen of the stories of this class, that of "The Poor Widow" may be selected, one which is thoroughly in earnest, and shows no traces of the humorous spirit that pervades many of its companions. According to popular Slavonic tradition, Christ still visits the earth from time to time in human form. Sometimes alone, at other times accompanied by some of the apostles, but always clad in the dress of a beggar, He wanders about the world, punishing the proud and hard of heart, and assisting the poor and afflicted. It is especially between Easter and Ascension-Day that these wanderings take place. During one of them, in the story in question, Christ and the twelve apostles arrive one night at a village, and ask for shelter at the home of a rich peasant. But he refuses, telling them to go to the cottage over the way. "There is a widow living there who takes beggars in; go to her." So they go and ask her for a night's lodging. Now, the widow is very poor, having nothing in the world but a morsel of bread and a handful of flour, and a cow which gives no milk, for it has not yet calved. But she cheerfully admits the applicants, and sets before them the morsel of bread; and they eat and are satisfied, and there remain over ever so many fragments. The next morning the old woman sends for the handful of flour to make pancakes of, and it also becomes miraculously increased. Her guests thank her, and take leave. As they go along, a wolf comes to meet them, and begs for something to eat. "Go to the widow's house," says the Saviour; "kill her cow and eat." Then the apostles wonder and remonstrate, saying, "She received and fed us so kindly; she was looking forward with such pleasure to having a calf from her cow; she would have had milk enough to support the whole family." But Christ replies, "So it must be;" and the wolf breaks into the widow's barn and kills her cow. And, when the old woman hears what has happened, she humbles herself and says, "The Lord gave, and the Lord has taken away; blessed be His will." The seeming beggars go a little farther on, and find a bag full of money. Christ orders it to roll into the rich peasant's farmyard. Again the apostles remonstrate, saying it would be better to send the money to the poor widow. But again they are told that "it must be so;" and the bag rolls to the feet of the churlish peasant, who stores it away with a discontented air, thinking "the Lord might just as well have sent a couple of them." Toward mid-day the apostles grow thirsty, and ask for water. Their Master directs them to a neighboring spring, but when they come to it they find it swarming with frogs and toads and snakes, and its waters foul and fetid. So they come back without slaking their thirst. A little farther on, Christ points out another spring to them, and they find full of pure water, cool and sweet, and around grow won-

drous trees, on which heavenly birds are singing. When they return, they are asked why they have tarried so long. "We have only been away three minutes," is their reply. Then the Lord says, "Not three minutes, but three whole years, have you spent there. As it was in the first spring, so will it be ill for the rich peasant in the next world; and as it was in the second, so will it be well in the next world for the poor widow."

Another striking story, relating to the life to come, is that of Christ's brother, which tells how a young man, who had a very close-fisted mother, went to church one Easter Sunday with a supply of Easter eggs for the beggars. But, after he had given away all his eggs, he found that there still remained one beggar to whom he had made no present, so he invited him home to dinner. But his mother was angry, and refused to sit down to table with the beggar, so he and his guest had to dine alone. After dinner they lay down to rest, and the young man saw that the beggar wore a cross which burnt like fire. So he asked his guest to exchange crosses with him, and to accept him as a "brother of the cross." This the beggar did, and then invited his entertainer to dine with him two days after. Accordingly, on the Tuesday the young man set out on his journey, going on till he came to a certain cross road, and there, in accordance with the beggar's instructions, asking for the blessing of God. On that a path opened before him, which eventually led him to Paradise. Before he had followed it far he heard the voices of many children calling to him, and they said, "O Christ's brother, say to Christ for us—have we to suffer long?" A little further on he saw a band of girls pouring water from one well into another, and they, too, addressed him in the same words. Lastly, he saw a fence, and supporting it were a number of old men, all covered with slime and ooze, and they also cried to him, "O Christ's brother, say to Christ for us—have we long to suffer?" Soon after that he met the old beggar-man who had invited him. "And then only did the peasant perceive that it was the Lord Jesus Christ Himself. 'Why, Lord, do the children suffer?' 'Their mothers cursed them while they were in the womb; it is impossible for them to come into Paradise.' 'And the girls?' 'They used to sell milk, and they put water into the milk; now they will have to draw water forever.' 'And the old men?' 'When they lived in the white world, they used to say, 'Only let us live well in this world, and no matter about the world to come; even if we prop a fence.' And now they will have to support that fence forever.' Then Christ led the young man into Paradise, where a place had been prepared for him, and the peasant did not want to go away." But some time afterward he saw his mother sitting in hell, and he implored that she might be pardoned. So he was told to make a rope out of hemp dust, and when he had gone on making it for thirty years, Christ told him he had worked enough for his mother, and might now take her out of hell. "So the son let down the rope to his mother, who was sitting in boiling pitch. The rope didn't burn, so God willed! The son pulled his mother quite out, and had already got hold of her by the head, when she screamed out at him, 'You hound, you've completely choked me!' Thereupon the rope broke, and the sinner fell back into the boiling pitch. She was not willing," said Christ, "even here to restrain her temper; let her sit in hell forever and ever."

Great stress is always laid in these stories on the necessity of observing the fasts and feasts of the Church. Out of a number of tales bearing on this subject, the following may be selected, being rendered especially noteworthy by the strange impersonation of a day which occurs in it. There was a peasant-woman "who did not pay honor to Mother Friday," but used to spin as usual upon that day. Once, when she had gone to sleep after dinner, the door opened and Mother Friday came into the cottage, dressed in a long white gown, and looking terrible angry. And she took a handful of the dust of flax from the floor, poured it into the sleeper's eyes, and then went away without saying a word. When the woman awoke she could not see. Then the other women came and told her all that had happened. So she began to pray, saying, "Mother Friday! forgive me! have pity on me, sinner that I am; I will offer you a candle, and will not let any one offend you, my mother!" And that night "Mother Friday came back and took the dust out of that woman's eyes." The story ends with the remark, "It is a great sin to offend Mother Friday."

The drunkenness to which the Russian peasant is so sadly addicted naturally forms the theme of many of his popular stories. One of

them tells how a certain man was in the habit of becoming intoxicated, and how one night, when he was coming back from a tavern, he fell into a river and was drowned. Some time after this his son Petrusha was going to church one Easter Sunday, when he heard a peasant-woman, who had stumbled over a stone, exclaim, "Why did the devil put you under my feet?" Whereon he rebuked her for using such bad language on her way to church. This pleased the devil, who considered that the woman had unnecessarily taken his name in vain, so he appeared to Petrusha in the form of a young man, stated frankly who he was, and invited him to dinner the next day, giving him full directions as to which road he must take. Petrusha accepted the invitation, and set out on the morrow, travelling for three days till he found himself in a dark and dreary wood, in the middle of which stood a rich palace. Before he entered it he met a girl who had been carried off thither from her village, and she told him that it was the abode of devils, and that his father was kept there in the shape of a wretched old horse used for carrying wood and water. Having learned from her what he must do, he entered the palace, and was hospitably received and feasted there. At the end of the banquet the devil offered him much gold and silver, but he refused to take any thing except the old horse which was his father. Having obtained it he went his way, and on his arrival at home, still following the friendly girl's instructions, he took off the leaden cross he wore, waved it three times round the horse, and then hung it round the neck of the animal, which immediately became a man. Petrusha recognized his father and led him into the cottage. The old man lived happily after that for many years, but never to his dying day would he touch so much as a drop of brandy.

[TO BE CONTINUED.]

### WHICH?

GRAND Lady Mildred had lovers a score;  
Up at the castle they thronged her door.  
Beauty was hers, and a mine of gold;  
But her smile and her heart were icy cold.

Down at the village, poor little Kate  
Had but one lover, of low estate.  
All that she had of wealth to impart  
Was a pleasant smile and a tender heart.

Came Lady Mildred's suitors—and went;  
Years rolled away, and her charms were spent.  
Haughtier grew she and colder still,  
So that all her splendor was void and chill.

In a humble home Kate passed her life,  
A doting mother, a gentle wife;  
Not without trials and cloudy days,  
But peace was about her in all her ways.

Grand Lady Mildred, wrinkled and old,  
Would still coquet—but can only scold.  
Kate lies buried under the sod,  
Waiting in quiet the mercy of God.

Would you be dragging out life to the last,  
With a hopeless future, a barren past?  
Or in the church-yard tranquilly rest,  
Ceasing from toil, and your memory blest?

### THE "LEVEE" OF NEW ORLEANS.

THE commercial prosperity of Louisiana may be said to date from the transfer of the French colony to the United States Government, in 1803. The population of the province at that time did not exceed fifty thousand inhabitants, scattered far and wide over the immense extent of territory known as the

Louisiana purchase. The commerce of Louisiana was first carried on in Indian canoes, pirogues, *bateaux*, and nondescript known as arks and flat-boats; then followed the great marine triumph, the keel-boat, so constructed, that it might make a return trip from New Orleans up the river to the growing settlements on the Ohio, by being "cordelled," or worked with oars, against the ever-sweeping current of the "Father of Waters." Many months were thus patiently and uncomplainingly consumed in this tedious way to make a trip from New Orleans to Louisville, such as is now performed in four or five days. The wildness of the country in these early times is illustrated by a characteristic advertisement, where the captain of a keel-boat uses as an argument in favor of public patronage the statement that the sides of his boat are proof against musket and rifle balls, and therefore the Indians and desperadoes who line the shores may be set at defiance.

Steamboats, which were absolutely necessary for the perfect redemption of the Mississippi Valley from a wilderness state, were introduced in the year 1812; but they were so imperfectly constructed, that it was five years before they achieved a triumph that created a favorable public attention. After that period of experiment, disaster, and loss, to those engaged in the great enterprise, a success was finally achieved that surpassed the most sanguine anticipations of the friends of the application of steam to the propulsion of vessels, as the great developing agent of the agricultural wealth of the valley of the Mississippi.

At the time of the "transfer," New Orleans contained eight thousand inhabitants; in forty years it became one of the leading commercial cities of the world. The entrepot of a valley unrivalled in extent, and in the rapidly increasing and intelligent character of its population, with a wealth of tributary streams that contain thousands of miles of navigable waters pouring their treasures into its lap, it is difficult to conjecture the future extent and grandeur of this one great Southern metropolis. The poetical name of New Orleans is the "Crescent City;" the title comes from the fact that it is built around one of the great "bends" so characteristic of the river. The consequence is that the city has a crescent-shaped front, which may be said to form a half circle, the diameter of which is six or seven miles. Standing, therefore, at either end of this curve, you see before you the vast sweep of the river front, running off in the distance and then gradually coming back again, thus displaying the merchandise, the buildings, and shipping in the most satisfactory and picturesque manner. No landing before any American city can compare with it for convenience and utility; and if any quay exists in Europe comparable to it, New Orleans would still possess the advantage of being more richly laden with evidences of teeming wealth. One of the peculiarities of the Mississippi River is, that its banks are constantly caving in and being washed away. By a law of its own, the annual deposit, which is enormous, settles in the "bends," and not on the points opposite; consequently, there annually accumulate, in front of the city, immense amounts of earth or sediment that constantly increase the depth of the front—this accumulation is termed the *batture*. The artificial elevation of the land above the highest water-level of the spring floods is called the *levee*, and upon this *artificial ridge*, and the heavy timbers and planks which serve as a connecting link with the water-craft, and the shore, is placed the merchandise that represents the vast and varied commerce of the city. Some of these platforms or stages, which are almost annually enlarged, vary from a hundred to one hundred and fifty feet in width, and often extend, in an unbroken line, a thousand and sometimes fifteen hundred feet—fronting more or less the whole line of the city, a distance, as we have already stated, of six or seven miles.

Congregated at the levee are hundreds of splendid steamers, and thousands of nondescript boats, thickly interspersed with ships of the largest size, and flying the signals of every civilized

people. The merchandise is of cotton, sugar, hemp, corn, pork, and kindred substantials, mixed indiscriminately with "Yankee notions," and with the finest goods from the manufactures of Manchester, and the more delicate looms of France and Italy.

New Orleans levee, more than any other given spot in the world, represents all spoken languages. The popular "levee clerk" is popular because, in a sentence of a dozen words, he can introduce a dozen languages, and could make himself intelligible if he had been at the confusion of Babel.

The German and Irish immigrants attempt to exchange salutations of sympathy with the just-imported Chinese and half-clad North American Indian. The gaunt priest just from Rome and the revival preacher from Puritan Boston jostle each other's elbows and stare curiously and suspiciously at each other.

The sandy, curly-haired sailors of the Neva drink gin cosily with the dark, straight-haired Kanacker from the Sandwich Islands. The agents of the merchant-princes, from every capital in Europe, exchange views with the local magnates, or seek advice from the wealthy representatives of our Northern cities.

The roystering, frank-hearted man of the West boisterously talks and laughs in all familiarity with the cold and awkward man of New England, and both sip a cup of coffee together later in the day, and seem mutually astonished to learn, from experience and the interchange of ideas, how much, in spite of external appearances, they are alike.

Stalwart negroes, whose muscles, from hard labor, have been developed until they rival those of the Farnese Hercules, light their cigars confidently, and without repulse, by the cheroot that is puffed by the aristocratic gentleman from Manila.

Prominent in all the side places, which, like nooks on the banks of swiftly-running streams, are even found on the New Orleans levee, are the old Creole negresses, who, by their culinary charms of "cat-fish gumbo," have about them crowds of hungry people, who appease their gross appetites at small cost, and talk gossip liberally in a thousand tongues. The Western desperado, who professes to have slain a dozen men in bloody fights, with a woman's solicitude, helps the consumptive invalid through the obtruding boxes and bales of merchandise, and carelessly-driven drays.

The brunette from the "Queen of the Antilles" contrasts finely with the blonde of New England, and the light hair of the belles from the Middle States seems more golden beside the massive bands of the dark hair of the Creole beauty.

Away up the river you hear a coughing, bellowing, thundering noise—it is made by the machinery of one of the greatest of our Mississippi River steamers. From its "smoke-stacks" rolls out a long, serpentine cloud that curls interminably along the horizon. The promised appearance of the steamer causes an excitement among the stevedores, hackmen, hotel-runners, and everybody in general. The boat comes up to the levee as gracefully as "a thing of life." Nothing is visible of its external appearance but the top of the tall chimneys and the gigantic wheel-houses—all else is hidden behind walls of cotton-bales—twenty-four hundred of which have been packed upon the decks and guards. In ten minutes after the hawser is made fast, well-trained gangs of laborers are rolling the valuable cargo ashore, and in a few hours the noble vessel is cleared for her up-river freight. Such is the shadowy outline of the history of Louisiana, and a still more vague and unsatisfactory description of its business mart, the Levee of New Orleans.

## SCALING THE MATTERHORN.

By PROFESSOR TYNDALL, LL. D., F. R. S.

**A**N admirable description of the difficulties of the Matterhorn, up to a certain elevation, has been given by Mr. Hawkins, in "Vacation Tourists for 1860." At that time, however, a temporary danger, sufficient to quell for a time the enthusiasm even of our lion-hearted guide, was added to the permanent ones. Fresh snow had

fallen two days before; it had quite oversprinkled the Matterhorn, converting the brown of its crags into an iron gray; this snow had been melted and refrozen, forming upon the rocks an enamelling of ice. Besides their physical front, moreover, in 1860, the rocks presented a psychological one, derived from the rumor of their savage inaccessibility. The crags, the ice, and the character of the mountain, all conspired to stir the feelings. Much of the wild mystery has now vanished, especially at those points which, in 1860, were places of virgin difficulty, but down which ropes now hang to assist the climber. The grandeur of the Matterhorn is, however, not to be effaced.

After some hours of steady climbing, we halted upon a platform beside the tattered remnant of one of my tents, had a mouthful of food, and sunned ourselves for an hour. We subsequently worked upward, scaling the crags and rounding the bases of those wild and wonderful rock-towers, into which the weather of ages has hewn the southern *arête* of the Matterhorn. The work here requires knowledge, but with a fair amount of skill it is safe work. I can fancy nothing more fascinating to a man given by nature and habit to such things, than a climb *alone* among these crags and precipices. He need not be *theological*, but, if complete, he must be religious, with such an environment. To the climber amongst them, the southern cliffs and crags of the Matterhorn are incomparably grander than those of the north. Majesty of form and magnitude, and richness of coloring, combine to ennoble them.

Looked at from Breuil, the Matterhorn presents two summits: the one, the summit proper, a square rock-tower in appearance; the other, which is really the end of a sharp ridge abutting against the rock-tower, an apparently conical peak. On this peak Bennen and myself planted our flag-staff in 1862, and with it, which had no previous name, Italian writers have done me the honor of associating mine. At some distance below it the mountain is crossed by an almost horizontal ledge, always loaded with snow, which, from its resemblance to a white neck-tie, has been called the *Cravatte*. On the ledge a cabin was put together last year. It stands above the precipice where I quitted my rope in 1862. Up this precipice, by the aid of a thicker—I will not say a stronger—rope, we now scrambled, and, following the exact route pursued by Bennen and myself five years previously, we came to the end of the *Cravatte*. At some places the snow upon the ledge fell steeply from its junction with the cliff; deep-step cutting was also needed where the substance had been melted and recongealed. The passage was soon accomplished along the *Cravatte* to the cabin, which was almost filled with snow.

Our first inquiry now had reference to the supply of water. We could, of course, always melt the snow, but this would involve a wasteful expenditure of heat. The cliff at the base of which the hut was built overhung, and from its edge the liquefied snow fell in showers beyond the cabin. Four ice-axes were fixed on the ledge, and over them was spread the residue of a second tent which I had left at Breuil in 1862. The water falling upon the canvas flowed toward its centre. Here an orifice was formed, through which the liquid descended into vessels placed to receive it. Some modification of this plan might probably be employed with profit for the storing up of water in drougthy years in England.

I lay for some hours in the warm sunshine, in presence of the Italian mountains, watching the mutations of the air. But when the sun sank the air became chill, and we all retired to the cabin. We had no fire, though warmth was much needed. A lover of the mountains, and of his kind, had contributed an India-rubber mattress to the cabin. On this I lay down, a light blanket being thrown over me, while the guides and porters were rolled up in sheepskins. The mattress was a poor defence against the cold of the subjacent rock. I bore this for two hours, unwilling to disturb the guides, but at length it became intolerable. The little circles, with a speck of intensified redness in the centre, which spotted the neck of our volunteer porter, prevented me from availing myself of the warmth of my companions, so I lay alone and suffered the penalty of isolation. On learning my condition, however, the good fellows were soon alert, and, folding a sheepskin round me, restored me gradually to a pleasant temperature. I fell asleep, and found the guides preparing breakfast, and the morning well advanced, when I opened my eyes.

It was past six o'clock when the two Maquignazes and myself quitted the cabin. The porters deemed their work accomplished, but they halted for a time to ascertain whether we were likely to be driven back or to push forward. We skirted the *Cravatte*, and reached the

ridge at its western extremity. This we ascended along the old route of Bennen and myself to the conical peak already referred to, which, as seen from Breuil, constitutes a kind of second summit of the Matterhorn. From this point to the base of the final crag of the mountain stretches an *arête*, terribly hacked by the weather, but on the whole horizontal. When I first made the acquaintance of this savage ridge it was almost clear of snow. It was now loaded, the snow being bevelled to an edge of exceeding sharpness. The slope to the left, falling toward Zmutt, was exceedingly steep, while the precipices on the right were abysmal. No other part of the Matterhorn do I remember with greater interest than this. It was terrible, but its difficulties were fairly within the grasp of human skill, and this association is more elevating than where the circumstances are such as to make you conscious of your own helplessness. On one of the sharpest teeth of the Spalla, Joseph Maquignaz halted, and, turning to me with a smile, remarked, "There is no room for giddiness here, sir." In fact, such possibilities, in such places, must be altogether excluded from the chapter of accidents of the climber.

It was at the end of this ridge, where it abuts against the last precipice of the Matterhorn, that my second flag-staff was left in 1862. I think there must have been something in the light falling upon this precipice that gave it an aspect of greater verticality when I first saw it than it seemed to possess on the present occasion. Or, as remarked in my brief account of our attempt in the *Saturday Review*, we may have been dazed by our previous exertion. I cannot otherwise account for our stopping short without making some attempt upon the precipice. It looks very bad, but no climber with his blood warm would pronounce it, without trial, insuperable. Fears of this rock-wall, however, had been excited long before we reached it. At three several places upon the *arête* I had to signalize points in advance, and to ask my companions in French (which Bennen alone did not understand) whether they thought these points could be reached without peril. Thus, bit by bit, we moved along the ridge to its end, where further advance was declared to be impossible. It was probably the addition of the psychological element to the physical; the reluctance to encounter new dangers on a mountain which had hitherto inspired a superstitious fear, that quelled further exertion.

To assure myself of the correctness of what is here stated, I have turned to my notes of 1862. The reperusal of them has interested me, and a portion of them may possibly interest some of the readers of this magazine. Here, then, they are, rapidly thrown together, and embracing our passage from the crags adjacent to the Col du Lion to the point where we were compelled to halt:

"We had gathered up our things, and bent to the work before us, when suddenly an explosion occurred overhead. Looking aloft, in mid-air was seen a solid shot from the Matterhorn, describing its proper parabola through the air. It split to pieces as it hit one of the rock-towers below, and its fragments came down in a kind of spray, which fell wide of us, but still near enough to compel a sharp look-out. Two or three such explosions occurred afterward, but we crept along the back-fin of the mountain, from which the falling boulders were speedily deflected right and left. Before the set of sun, we reached our place of bivouac. A tent was already there. Its owner had finished a prolonged attack upon the Matterhorn, and kindly permitted the tent to remain, thus saving me the labor of carrying up one of my own. I had with me a second and smaller tent, made for me under the friendly supervision of Mr. Whympier, which the exceedingly nimble-handed Carrel soon placed in position upon a platform of stones. Both tents stood in the shadow of a great rock, which sheltered us from all projectiles from the heights.

"As the evening advanced, fog, the enemy of the climber, came creeping up the valley, and heavy flounces of cloud draped the bases of the hills. The fog thickened through a series of intermittences which only a mountain-land can show. Sudden uprushings of air would carry the clouds aloft in vertical currents, while at other places horizontal gusts wildly tossed them to and fro; or, impinging upon each other at oblique angles, formed whirling cyclones of cloud. The air was tortured on its search of equilibrium. Explosive peals above us, succeeded by the sound of tumbling rocks, were heard from time to time. We were swathed in the densest fog when we retired to rest, and had scarcely a hope that the morrow's sun would be able to dispel the gloom. Throughout the night I heard the intermittent roar of the stones as they rushed down an adjacent couloir. Looking at midnight through a small hole in the canvas of my tent, I

saw a star. I rose, and found the heavens without a cloud; while above me the black battlements of the Matterhorn were projected against the fretted sky.

"It was four A. M. before we started. We adhered to the hacked and weatherworn spine, until its disintegration became too vast. The alternations of sun and frost have made wondrous havoc on the southern face of the Matterhorn; cutting much away, but leaving brown-red masses of the most imposing magnitude behind—pillars, and towers, and splintered obelisks, clearly cut out of the mountain—grand in their hoariness, and softened by the coloring of age. At length we were compelled to quit the ridge for the base of a precipice which seemed to girdle the mountain like a wall. It was a clean section of rock, with cracks and narrow ledges here and there. We sought to turn this wall in vain. Bennen swerved to the right and to the left to make his inspection complete. There was no alternative: over the precipice we must go, or else retreat. For a time it was manifest our onset must be desperate. We grappled with the cliff. Walters, an exceedingly powerful climber, went first. Close to him was Bennen, with arm and knee and counsel ready in time of need. As usual, I followed Bennen, while the two porters brought up the rear. The behavior of all of them was admirable. A process of reciprocal lifting continued for half an hour, when a last strong effort threw Walters across the brow of the precipice, and rendered our progress thus far secure.

"After scaling the precipice, we found ourselves once more upon the ridge with safe footing on the ledges of gneiss. We approached the conical peak seen from Breuil, while before us, and, as we thought, assuredly within our grasp, was the proper summit of the renowned Matterhorn. To test Bennen's feelings, I remarked, 'We shall at all events reach the lower peak.' There was a kind of scorn in his laugh as he replied, stretching his arm toward the summit, 'In an hour, sir, the people of Zermatt will see our flag-staff planted yonder.' We went upward in this spirit, a triumph forestalled, making the ascent a jubilee.

"We reached the first summit, and on it fixed our flag. But already doubt had begun to settle about the final precipice. Walters once remarked, 'We may still find difficulty there.' It was, perhaps, the pressure of the same thought upon my own mind that caused its utterance to irritate me. So I grimly admonished Walters and we went on. The nearer, however, we came to the summit, the more formidable did the precipice appear. From the point where we had planted our flagstaff a hacked and extremely acute ridge (the Spalla), with ghastly abysses right and left of it, ran straight against the final cliff. We sat down upon the ridge and inspected the precipice. Three out of the four men shook their heads, and muttered, 'Impossible.' Bennen was the only man amongst them who refused, from first to last, to utter the word.

"Resolved not to push them beyond the limits of their own clear judgments, I was equally determined to advance until that judgment should pronounce the risk too great. I, therefore, pointed to a tooth at some distance from the place where we sat, and asked whether it could be reached without much danger. 'We think so,' was the reply. 'Then, let us go there.' We did so and sat down again. The three men murmured, while Bennen himself growled like a foiled lion. 'We must give it up,' was here repeated. 'Not yet,' was my answer. 'You see yonder point quite at the base of the precipice; do you not think we might reach it? The reply was 'Yes.' We moved cautiously along the *arête* and reached the point aimed at. So savage a spot I had never previously visited, and we sat down there with broken hopes. The thought of retreat was bitter. We may have been dazed by our previous efforts, and thus rendered less competent than fresh men would have been to front the danger before us. As on other occasions, Bennen sought to fix on me the onus of returning, but with the usual result. My reply was, 'Where you go, I follow, whether it be up or down.' It took him half an hour to make up his mind. Had the other men not yielded so utterly, he would probably have tried longer. As it was, our occupation was gone, and hacking a length of six feet from our ladder, we planted it on the spot where we halted. So much is due to the memory of a brave man.

Seven hundred feet, if the barometric measurement can be trusted, of very difficult rock-work now lay above us. In 1862 this height had been underestimated by both Bennen and me. Of the 14,800 feet of the Matterhorn, we then thought we had accomplished 14,600. If the barometer speaks truly, we had only cleared about 14,200. Descending the end of the *arête*, we crossed a narrow cleft, and grappled with

the rocks at the other side of it. Our ascent was oblique, bearing to the right. The obliquity at one place fell to horizontality, and we had to work on the level round a difficult protuberance of rock. We cleared the difficulty without haste, and then rose straight against the precipice. Joseph Maquignaz drew my attention to a rope hanging down the cliff, left there by himself on the occasion of his first ascent. We reached the end of this rope, and some time was lost by the guide in assuring himself that it was not too much frayed by friction. Care in testing it was doubly necessary, for the rocks, bad in themselves, were here crusted with ice. The rope was in some places a mere hempen cord surrounded by a casing of ice, over which the hands slid helplessly. Even with the rope, in this condition it required an effort to get to the top of the precipice, and we willingly halted there to take a minute's breath. The ascent was virtually accomplished, and a few minutes more of rapid climbing placed us upon the crest of the mountain. Thus ended an eight years' war between myself and the Matterhorn.

The day thus far had swung through alternations of fog and sunshine. While we were on the ridge below, the air at times was blank and chill with mist; then with rapid solution the cloud would vanish, and open up the abysses right and left of us. On our attaining the summit a fog from Italy rolled over us, and for some minutes we were clasped by a cold and clammy atmosphere. But this passed rapidly away, leaving above us a blue heaven, and far below us the sunny meadows of Zermatt. The mountains were almost wholly unclouded, and such clouds as lingered amongst them only added to their magnificence. The Dent d'Erin, the Dent Blanche, the Gabelhorn, the Mischabel, the range of heights between it and Monte Rosa, the Lyskamm, and the Breithorn were all at hand, and clear; while the Weisshorn, noblest and most beautiful of all, shook out a banner toward the north, formed by the humid southern air as it grazed the crest of the mountain.

The world of peaks and glaciers surrounding this immediate circle of giants was also open to us to the horizon. Our glance over it was brief, and our enjoyment of it intense; for it was eleven o'clock, and the work before us soon claimed all our attention. I found the *débris* of my former expedition everywhere—below, the fragments of my tents, and on the top a piece of my ladder fixed in the snow as a flagstaff. The summit of the Matterhorn is a sharp horizontal *arête*, and along this we now moved eastward. On our left was the roof-like slope of snow seen from the Riffel and Zermatt, on our right were the savage precipices which fall into Italy. Looking to the farther end of the ridge, the snow there seemed to be trodden down, and I drew my companions' attention to the apparent footmarks. As we approached the place, it became evident that human feet had been there two or three days previously. I think it was Mr. Elliot who had made this ascent—the first accomplished from Zermatt since the memorable one of 1865. On the eastern end of the ridge we halted to take a little food; not that I seemed to need it. It was the remonstrance of reason, rather than the consciousness of physical want, that caused me to do so.

Facts of this kind illustrate the amount of force locked up in the muscles which may be drawn upon without renewal. I had quitted London ill, and when the Matterhorn was attacked the illness had by no means subsided. In fact, this climb was one of the means adopted to drive the London virus from my blood. The day previously I had taken scarcely any food, and, on starting from the cabin, half a cup of bad tea, without any solid whatever, constituted my breakfast. Still, during the five hours' climb from the cabin to the top of the Matterhorn, though much below par, physically and mentally, I felt neither faint nor hungry. This is an old experience of mine upon the mountains. The Weisshorn, for example, was climbed on six meat lozenges, though it was a day of nineteen hours. Possibly this power of long-continued physical effort without eating may be a result of bad digestion, which deals out stingily, and therefore economically, to the muscles the energy of the food previously consumed?

We took our ounce of nutriment and gulp of wine (my only sustenance during the entire day), and stood for a moment silently and earnestly looking down toward Zermatt. There was a certain official formality in the manner in which the guides turned to me and asked, "*Etes-vous content d'essayer?*" A sharp responsive "*Oui!*" set us immediately in motion. It was nearly half-past eleven when we quitted the summit. The descent of the roof-like slope, already referred to, offered no difficulty; but the gradient very soon became more formidable. One of the two faces of the Matterhorn pyramid,

seen from Zermatt, falls toward the Zmutt glacier, and has a well-known snow-plateau at its base. The other face falls toward the Furgge glacier. We were on the former. For some time, however, we kept close to the *arête* formed by the intersection of the two faces of the pyramid, because nodules of rock jutting from it which offered a kind of footing. These rock protuberances helped us in another way: round them an extra rope which we carried was frequently doubled, and we let ourselves down by the rope as far as it could reach, liberating it afterward (sometimes with difficulty) by a succession of jerks. In the choice and use of these protuberances the guides showed both judgment and skill. The rocks became gradually larger and more precipitous; a good deal of time being consumed in dropping down and doubling round them. Still, we preferred them to the snow-slope at our left, as long as they continued practicable.

This they at length ceased to be, and we had to commit ourselves to the slope. It was in the worst possible condition. When snow first falls at these great heights it is usually dry, and has no coherence. It resembles, to some extent, flour, or sand, or sawdust. Shone upon by a strong sun it shrinks and becomes more consolidated, and when it is subsequently frozen it may be safely trusted. Even though the melting of the snow and its subsequent freezing may be only very partial, the cementing of the granules adds immensely to the safety of the footing; but then the snow must be employed before the sun has had time to unlock the rigidity imparted to it by the night's frost. We were on the steepest Matterhorn slope during the two hottest hours of the day, and the sun had done his work effectually. The snow seemed to offer no foothold whatever; with cautious manipulation it regelated, but to so small an extent, that the resistance due to regelation was insensible to the foot. The layer of snow was about fifteen inches thick. In treading it we came immediately upon the rock, which in most cases was too smooth to furnish either prop or purchase. It was on this slope that the Matterhorn catastrophe occurred: it is on this slope that other catastrophes will occur, if this mountain should ever become fashionable.

Joseph Maquignaz was the leader of our little party, and a cool and competent leader he proved himself to be. He was earnest and silent, save when he answered his brother's anxious and oft-repeated question, "*Es-tu bien placé, Joseph?*" Along with being perfectly cool and brave, he seemed to be perfectly truthful. He did not pretend to be "*bien placé*" when he was not, nor avow a power of holding which he knew he did not possess. Pierre Maquignaz is, I believe, under ordinary circumstances, an excellent guide, and he enjoys the reputation of being never tired. But, in such circumstances as we encountered on the Matterhorn, he is not the equal of his brother. Joseph, if I may use the term, is a man of high boiling point; his constitutional *sang-froid* resisting the ebullition of fear. Pierre, on the contrary, shows a strong tendency to boil over in perilous places.

Our progress was exceedingly slow, but it was steady and continued. At every step our leader trod the snow cautiously, seeking some rugosity on the rock beneath it. This, however, was rarely found, and in most cases he had to establish practicable attachments between the snow and the slope which bore it. No semblance of a slip occurred in the case of any one of us, and, had a slip occurred, I do not think the worst consequences could have been avoided. I wish to stamp this slope of the Matterhorn with the character that really belonged to it when we descended it, and I do not hesitate to express the belief that the giving way of any one of our party would have carried the whole of us to ruin. Why, then, it may be asked, employ the rope? The rope, I reply, all its possible drawbacks under such circumstances notwithstanding, is the safeguard of the climber. Not to speak of the moral effect of its presence, an amount of help upon a dangerous slope that might be measured by the gravity of a few pounds is often of incalculable importance; and thus, though the rope may be not only useless but disastrous if the footing be clearly lost, and the glissade fairly begun, it lessens immensely the chance of this occurrence.

With steady perseverance, difficulties upon a mountain, as elsewhere, come to an end. We were finally able to pass from the face of the pyramid to its rugged edge, feeling with comfort that honest strength and fair skill, which might have gone for little on the slope, were here masters of the situation.

Standing on the *arête* at the foot of a remarkable cliff-gable seen from Zermatt, and permitting the vision to range over the Matter-

horn, its appearance was exceedingly wild and impressive. Hardly two things can be more different than the two aspects of the mountain from above and below. Seen from the Riffel, or Zermatt, it presents itself as a compact pyramid, smooth and steep, and defiant of the weathering air. From above, it seems torn to pieces by the frosts of ages, while its vast facettes are so foreshortened as to stretch out into the distance like plains. But this under estimate of the steepness of the mountain is checked by the deportment of its stones. Their discharge along the side of the pyramid was incessant, and at any moment, by detaching a single boulder, we could let loose a cataract of them, which flew with wild rapidity, and with a clatter as loud as thunder, down the mountain. We once wandered too far from the *arête* and were warned back to it by a train of these missiles sweeping past us.

As long as the temperature of our planet differs from that of space, so long will the forms upon her surface undergo mutation, and as soon as equilibrium has been established we shall have, not peace, but death. Life is the product and accompaniment of change, and the self-same power that tears the flanks of the hills to pieces is the mainspring of the animal and vegetable worlds. Still, there is something chilling, if not humiliating, in the contemplation of the irresistible and remorseless character of those infinitesimal forces, whose summation through the ages pulls down even the Matterhorn. Hacked and hurt by time, the aspect of the mountain from its higher crags saddened me. Hitherto the impression it made was that of savage strength, but here we had inexorable decay.

This notion of decay implied a reference to a period of prime, when the Matterhorn was in the full strength of mountainhood. Thought naturally ran back to its possible growth and origin. Nor did it halt there, but wandered on through molten worlds to that nebulous haze which philosophers have regarded, and with good reason, as the proximate source of all material things. Could the blue sky above be the residue of that haze? Would the azure, which deepens on the heights, sink into utter darkness beyond the atmosphere? I tried to look at this universal cloud, containing within itself the prediction of all that has since occurred; I tried to imagine it as the seat of those forces whose action was to issue in solar and stellar systems, and all that they involve. Did that formless fog contain potentially the *sadness* with which I regarded the Matterhorn? Did the *thought* which now ran back to it simply return to its primeval home? If so, had we not better recast our definitions of matter and force; for, if life and thought be the very flower of both, any definition which omits life and thought must be inadequate, if not untrue. Are questions like these warranted? Are they healthy? Ought they not to be quenched by a life of action? Healthy or unhealthy, *can* we quench them? And if the final goal of man has not been yet attained; if his development has not been yet arrested, who can say that such yearnings and questionings are not necessary to the opening of a finer vision, to the budding and the growth of diviner powers? When I look at the heavens and the earth, at my own body, at my strength and imbecility of mind, even at these ponderings, and ask myself, Is there no being or thing in the universe that knows more about these matters than I do, what is my answer? Does antagonism to theology stand with none of us in the place of a religion? Supposing our theologic schemes of creation, condemnation, and redemption, to be dissipated; and the warmth of denial, which, as a motive force, can match the warmth of affirmation, dissipated at the same time; would the undivided mind return to the meridian of absolute neutrality as regards these ultra-physical questions? Is such a position one of stable equilibrium? The channels of thought being already formed, such are the questions, without replies, which could run through the mind during a ten minutes' halt upon the weathered spire of the Matterhorn.

### COLLEGE GOVERNMENT.

**A**N interesting illustration of the progress of education is furnished by the recent change of discipline in Columbia College. Since its incorporation, a hundred and fifteen years ago, it has, in accordance with general usage, regulated the conduct of its students by a body of statutes and by-laws consisting of detailed directions for deportment, and corresponding penalties for their violation. These have doubtless undergone various modifications within the last hundred years; but they

are now all suspended, as a matter of trial, and a few general regulations substituted, the effect of which is to leave the student more in his own care. External government by repressive rules has been replaced by self-government. The students are assumed to be men, and gentlemen; they are to be allowed the freedom which pertains to this character, and held also to its responsibilities. The unwritten rules which govern social life are to be applied to that of the college. So long as the students deport themselves with propriety, they will be allowed the benefits of the institution; when they cease to be fit associates of gentlemen, they will be excluded from the place. The requisitions regarding study are only such as are deemed needful to secure due coöperation in college work: if the student qualifies himself for graduation, he will graduate; otherwise not.

The question at issue between the old policy and the new is more than a mere matter of college expediency; it is nothing less than the vital question, What mode of government is most conducive to the formation of an elevated moral character? or, What course is best calculated to produce that habitual self-restraint and rectitude of conduct which are needed as a preparation for the responsibilities of life? The higher actions of men are the offspring of motives, and motives are of different kinds—good and bad, high and low; while character results from the quality of those which become predominate and determining. It is the office of education in its moral aspect to bring the student under the influence of those higher and nobler motives which shall spontaneously issue in right action.

Current school discipline, borrowing its theory from civil government, assumes that the strongest motive by which human beings are influenced is fear, or the dread of punishment. But the contrasted purposes in the two cases are here quite overlooked. In political legislation, the true function of which is negative, that is, the prevention of wrongs, the appeal is very properly made to the motive of fear. Civil government presupposes criminality—indeed, springs out of it—and is legitimately occupied in dealing with the worst classes of society by punitive measures. But the office of the college, on the other hand, is positive and constructive. It has to direct the agencies which control intellectual and moral growth, to develop the class of feelings which lead to right action.

Can education effect this in the best manner by the pains-and-penalties policy which is directed to the emotion of fear? Obviously not. This motive appeals to the most degraded of the race; it is the meanest that can actuate a human being, and just to the degree in which it becomes operative it calls out the lower qualities and results in a debased type of character. It is a policy of coercive checks and restraints, and takes effect only upon those who combine weakness with evil tendencies—who wish to do wrong, but dare not. But the course which may have a salutary influence upon the craven and cowardly is resented and scorned by better natures. The code of rules and inflictions which is thrust into the student's face upon entering college he too often interprets as a snub and a challenge. He finds the authorities joining the police function with the tutorial, and accordingly the more self-reliant and mettlesome of the students—who are always leaders—accept the tempting situation, and enter upon a system of baffling and tormenting the professors. In a faculty of ten or twenty instructors, there are generally some more vain, dogmatic, and irritable than the rest—men who have an unhappy facility of arousing antagonisms—and these become delicious game. On grounds of dignity, the other officers are compelled to stand by their colleagues, and thus the elements of conflict are ready and abundant. The history of college government under this system has been precisely what it must have been—a history of insubordination, of petty and provoking strifes, often rising into violence, and mitigated or aggravated, as the case may be, by the quality of the students and the character of the governing officials.

The new policy presupposes the existence of higher feelings in the mind of the student, and to these feelings it appeals. It

presses the student back upon his sense of right and justice, and upon his manly and honorable impulses; and, in assuming that they exist and are strong, it does not miscalculate. There is no more controlling sentiment in human nature than that of honor. It may take false directions; but it is all-powerful. In its defence, nations will sacrifice all else; to maintain it, individuals will throw away their lives as worthless; even among thieves it is a power. The college authorities who do not recognize this feeling in the minds of students, or who suffer it to be arrayed against them, instead of using it as a potent agency of moral control, have yet to learn the rudiments of their avocation. But appeals to honor will be of little avail, unless inspired by a genuine trust and confidence which ill comports with a system of petty exactions and threatenings.

Another efficient agency which should be turned to valuable account in school management is public opinion among the students. The wise teacher, who takes counsel of his opportunities rather than of his pride of position, will be cautious how he contravenes the public sentiment of his school. If wrong, he will aim to correct it—he will wait to correct it; but, until changed, he will respect and not defy it. Even in society, men are tried by their peers for alleged offences; can there be a doubt that this method would work with far greater advantage among young men at college? In civil life, we hold public opinion to be the fountain of law, and are fast arriving at the conclusion that enactments are practical nullities, unless supported by it; can there be a question that the principle is equally sound in its application to college government? Backed by the public opinion of his school, a teacher is wellnigh omnipotent; but here again the indispensable prerequisite is a faith in the good intentions, if not in the judgment, of the young men. A student will break rules, but he will not incur the condemnation of his fellows. It is one thing for the officials to dismiss him from college for the infraction of a statute—the chances are high that he will leave with the sympathy of his associates, a martyr to arbitrary authority; but it is another and a far different thing for him to be expelled by the verdict of his fellow-students—the disgrace would be intolerable, and could be incurred only by those who well deserved it.

This movement is, therefore, something more than a mere shift of college tactics for the ends of passing convenience; it is in the highest sense itself educational—it is a practical extension of the curriculum to the department of moral culture. The inculcation of virtuous precepts, fervid exhortations to rectitude, denunciations of evil courses, and threats of punishment, supplemented by the reading of a little ethics in the last year of the course, are far from what is required; in fact, all this has been done, if not overdone, long before in the home and the family. Little is needed in the theory of morality; much in its practice, for it is only to be truly learned by making it the law of action in daily life. The higher faculties of our nature, like all its other faculties, grow into strength and become controlling in conduct only through exercise. It is a narrow notion that the legitimate college work is limited to class-room recitations and the preparation for them, with the accompaniment of enforced decency of behavior. More important in its action upon the student's mind than any formal exercise is the subtle, unconscious influence of the teacher—the pervading feeling—the tone and spirit of the place. In college, even more than in life, it is the contagion of personal influence that touches the deepest springs of action, that inspires the higher feelings and colors the student's life. In entering upon this experiment, therefore, the faculty of a college are but recognizing a higher sphere of educational duty. They are not shirking responsibility, but incurring new and more serious responsibility.

But, besides the personal influence of the instructor, there is an influence of the studies themselves, which must not be overlooked in estimating the governmental agencies of the college. The seriously-occupied students give but little trouble,

and the teacher who can inspire an interest in study has in this a potent element of control. It is generally the young men not much engaged with their work whose activities overflow into the channels of mischief. A great deal depends, therefore, in this matter, upon the attractiveness of the intellectual pursuits. We might infer that scientific institutions which deal with modern and practical subjects having a direct and obvious bearing upon life should have the least difficulty in managing students, and this conclusion we understand to be confirmed in actual experience. On the other hand, classical institutions, which are mainly occupied with drill in dead languages, the advantage of which is not immediate usefulness, but an alleged, indefinite, and remote mental discipline, cannot fail to take a less powerful hold upon the student's feelings, and they are therefore driven to the adoption of an external coercive discipline. The old colleges, therefore, have an intrinsic embarrassment in entering upon this experiment of leaving students to themselves, which will greatly enhance the credit of success, if success be reached.

### MALAYAN FEROCITIES.

THE men are exceedingly jealous and very strict with their wives. A married woman may not accept a cigar or a sirih-leaf from a stranger, under pain of death. I was informed that some years ago one of the English traders had a Balinese woman of good family living with him—the connection being considered quite honorable by the natives. During some festival this girl offended against the law by accepting a flower or some such trifle from another man. This was reported to the Rajah (to some of whose wives the girl was related), and he immediately sent to the Englishman's house, ordering him to give the woman up, as she must be "krissed." In vain he begged and prayed, and offered to pay any fine the Rajah might impose, and finally refused to give her up unless he was forced to do so. This the Rajah did not wish to resort to, as he no doubt thought he was acting as much for the Englishman's honor as for his own; so he appeared to let the matter drop. But some time afterward he sent one of his followers to the house, who beckoned the girl to the door, and then, saying, "The Rajah sends you this," stabbed her to the heart. More serious infidelity is punished still more cruelly, the woman and her paramour being tied back to back and thrown into the sea, where some large crocodiles are always on the watch to devour their bodies. One such execution took place while I was at Ampanam, but I took a long walk into the country to be out of the way till it was all over, thus missing the opportunity of having a horrible narrative to enliven my somewhat tedious story.

One morning, as we were sitting at breakfast, Mr. Carter's servant informed us that there was an "Amok" in the village—in other words, that a man was "running a muck." Orders were immediately given to shut and fasten the gates of our enclosure; but, hearing nothing for some time, we went out, and found there had been a false alarm, owing to a slave having run away, declaring he would "amok," because his master wanted to sell him. A short time before, a man had been killed at a gaming-table, because, having lost half a dollar more than he possessed, he was going to "amok." Another had killed or wounded seventeen people before he could be destroyed. In their wars a whole regiment of these people will sometimes agree to "amok," and then rush on with such energetic desperation as to be very formidable to men not so excited as themselves. Among the ancients these would have been looked upon as heroes or demigods who sacrificed themselves for their country. Here it is simply said—they made "amok."

Macassar is the most celebrated place in the East for "running a muck." There are said to be one or two a month on the average, and five, ten, or twenty persons are sometimes killed or wounded at one of them. It is the national and therefore the honorable mode of committing suicide among the natives of Celebes, and is the fashionable way of escaping from their difficulties. A Roman fell upon his sword, a Japanese rips up his stomach, and an Englishman blows out his brains with a pistol. The Bugis mode has many advantages to one suicidically inclined. A man thinks himself wronged by society—he is in debt but cannot pay—he is taken for a slave, or has gambled

away his wife or child into slavery—he sees no way of recovering what he has lost, and becomes desperate. He will not put up with such cruel wrongs, but will be revenged on mankind and die like a hero. He grasps his kris-handle, and the next moment draws out the weapon and stabs a man to the heart. He runs on, with bloody kris in his hand, stabbing at every one he meets. “Amok! Amok!” then resounds through the streets. Spears, krisses, knives, and guns, are brought out against him. He rushes madly forward, kills all he can—men, women, and children—and dies overwhelmed by numbers amid all the excitement of a battle. And what that excitement is those who have been in one best know, but all who have ever given way to violent passions, or even indulged in violent and exciting exercises, may form a very good idea. It is a delirious intoxication, a temporary madness that absorbs every thought and every energy. And can we wonder at the kris-bearing, untaught, brooding Malay preferring such a death, looked upon as almost honorable, to the cold-blooded details of suicide, if he wishes to escape from overwhelming troubles, or the merciless clutches of the hangman and the disgrace of a public execution, when he has taken the law into his own hands, and too hastily revenged himself upon his enemy? In either case he chooses rather to “amok.”

### TABLE-TALK.

SOME remarks having appeared in print as to the English rendering of the title to Victor Hugo's new romance, “L'Homme Qui Rit,” and on other points, we think that our readers may be interested in the following “Note by the Translator,” which will be prefixed to the first edition in book form:

“There has been so much discussion as to the proper rendering of the original title of this work, ‘L'HOMME QUI RIT,’ that it may be advisable to state why ‘THE MAN WHO LAUGHS’ has been adopted. It is not only literal in version, it expresses at the same time the author's meaning as nearly as the genius of the English tongue allows. Had Victor Hugo intended to convey the idea of ‘*The Laughing Man*,’ or, in fact, of a voluntary laughter, he would have called his book ‘*Le Rieur*,’ or ‘*L'Homme Rieur*,’ just as in his own language the laughing hyena is called *Phyène rieuse*, and not *Phyène qui rit*. ‘The Laughing Man’ cannot be correctly rendered into French by *L'Homme qui rit*; *L'Homme qui rit* is ‘The Man Who Laughs,’ and nothing else.

“Another point may be noticed. The hurry, consequent on the peculiar agreement between the publishers in Paris and in this city, has given rise to an error, more curious perhaps than important. The fifth chapter of Book I., Part I., is headed ‘Human Intervention,’ though the proper and far more significant heading is ‘The Tree of Human Invention.’ The mistake arose thus: The translation was made from slips forwarded hither by mail; and the title of this particular chapter was so torn in transmission, that the imperfect phrase . . . ‘*vention Humaine*’ was alone legible. A filling-up was requisite immediately, and the term ‘Human Intervention’ was adopted at a guess.

“The careful and critical reader will find occasional errors in history and geography, and not a few in Victor Hugo's English nomenclature. These have not been unobserved; but the translator did not deem it his duty to correct them.”

The dramatic season of the present year has been marked by several Shakespearian revivals, in each of which there has been unusual attention both to scenery and accessories. But, in each instance, the play has been translated into a panorama, and far more attention given to the pictorial effect than to the dramatic rendition. We must praise the efforts to render the plays produced perfect historic illusions, but must deplore the neglect of those essential dramatic elements without which a play is a mere show. All the beauty of gardens, palace-halls, Gothic architecture, and “cloud-capped towers,” cannot compensate for the loss of the essential soul and spirit of a play. So far as scenic display sets forth historic periods, adds to the illusion of the story, or enforces dramatic situations, it is entitled to our full acceptance. But, when under its dominant sway, portraiture becomes unnecessary, character unimportant,

language disregarded, passion subordinated; when the assemblage sees rather than hears, and admires rather than feels, it simply extracts from the drama much of its imagination, its poetry, and its humanity. In fact, these Shakespearian revivals have been, in no true sense, revivals at all. There has been no special attempt to illuminate the poetry of Shakespeare, or to illustrate his characters. Instead of having been exceptionally well acted, they have been almost exceptionally poorly acted. There has been no effective dramatic *ensemble*, no noticeable excellence; and that only can be justly considered a revival which, by the perfection of the histrionic array, gives new force, expression, and brilliancy to the characters and poetry of the dramatist.

A project has been broached in London for the organization of a scientific club. There are army and navy clubs, aristocratic and reform clubs, literary, artistic, dramatic, and sporting clubs; but men of science, as such, have hitherto had no rallying-point of social intercourse, such as these organizations afford. Such an institution, besides its local and economical conveniences for members, would have a further value, we apprehend, by bringing into more familiar intercourse and facilitating the exchange of ideas between men of widely-different scientific pursuits. The various scientific societies attract together those who are engaged in special lines of study; and such is the inevitable tendency to division of labor, and so absorbing do special inquiries become, that the disposition to narrowness of views is strong. A wholesome corrective of this tendency would be that free interchange of opinion and mutual criticism which club-life affords. The project to establish a scientific club is further significant as illustrating the gradual growth and differentiation of the scientific element in modern society. Science is every day becoming more and more influential in civilization, and must be more and more recognized as a distinctive and independent agency in human affairs.

One of the greatest difficulties of teaching is the inability of the instructor to enter perfectly into the pupil's state of mind. A teacher knows a thing, sees it clearly, and may have been years arriving at the perception of it in its various bearings and relations. He then undertakes to communicate this piece of knowledge to one who knows nothing about it. Some phase of it, which, at the time, strikes the teacher as most complete, is set before the pupil in language consistent with the teacher's views. Now, the first difficulty occurs in the want of entire correspondence between the ideas attached to the same words by the teacher and pupil. It rarely happens that even any two educated minds will coincide in this particular. To overcome this obstacle, repeated and varying statements must be made, so that one impression may correct another where words have been but imperfectly understood. But the greatest difficulty lies in this, that no teacher can remember the history of the doubts and embarrassments that were overcome in his own gradual progress to a thorough understanding of the matter in hand; and besides, imperfect as is his recollection, only one phase of it occupies his consciousness at a time. And, however much of one's mental history is remembered, it is scarcely probable that the troubles of the pupil will be just those that the teacher experienced.

Again, owing to mental peculiarities, some part of an explanation seizes the attention of the pupil, and quite engrosses it for the time, so that other parts, equally important, are unattended to, and the conception formed is partial and imperfect. The teacher, therefore, who expects a single explanation to end the matter and afford the pupil a fair opportunity, makes a great mistake. The chances are many that the lesson is not understood, and, though a verbal account should be rendered by the pupil that would seem to indicate a correct apprehension of the statement, yet much would be gained by resuming the subject

at another time under different aspects of thought on the part of the teacher, which will lead to fresh explanations, while the same newness of approach would change the mental attitude of the learner, widen his notions, and correct his errors. Every such new attack upon a subject of study should be so conducted by the teacher as to make it a means of revealing the pupil's mental condition.

The Hon. David A. Wells, in an important and seemingly exhaustive letter on the present condition of the working-classes, makes some statements in regard to savings-banks, which, we have reason to believe, are not entirely accurate, at least so far as those of the city of New York are concerned. The assertion had been made that the increase of savings-bank deposits was evidence of the improved condition of the working-people, and Mr. Wells, in disproof of this, charges, first, that the increase of the price of real estate prevents many persons from purchasing homesteads, who otherwise would do so, their savings accumulating in bank instead; and, second, that the exemption of these depositories from tax brings in as depositors a wealthier class than that for which they were designed. In regard to the first charge, we have the assurance of a bank-officer that at no time in his experience has money been so largely drawn from the banks for real-estate investment as it is now. As to the second charge, the statistics of one of our largest banks are before us, and they speak for themselves. Of nearly 27,000 deposits made in 1868, fewer than 400 were of over \$1,000 each; over 20,000 were in sums less than \$100 each; and 12,000 in sums less than \$50 each. Upon referring to the list of classified occupations, published by the same bank, we find the depositors to have been almost entirely working-people. Mr. Wells would seem, by the tenor of his argument, to condemn the exemption of these banks from taxation. It is certainly important that the character of savings-banks, their relation to our working-people, and the service they render to the laborer, should be well understood before any thing should be done calculated to decrease the interest the banks are now paying on deposits, and thereby directly affect the well-being of the working-class. That the great bulk of savings-bank deposits does come from the laboring portions of the community is undoubtedly true; and that this system of savings confers a greater benefit upon the class it is designed to serve than all the charitable organizations united, is the earnest conviction of every one who has studied its history and examined its workings.

### Brief Notes.

MR. GODFREY FRANKENSTEIN, an American painter, is exhibiting in England a picture of the Horse-shoe Fall at Niagara, which has received very marked commendation at the hands of the English press. We do not recall the fact of the picture being exhibited here. The London *Examiner* gives it a favorable notice, remarking that, while the performance does not rise to that "thorough identification with Nature" which doubtless was Mr. Frankenstein's aim, yet "what he has accomplished shows him to be an artist with a soul in him—somewhat of a realistic soul, perhaps—and, if he have not given to us all that our imagination would lead us to expect in presence of the grand phenomenon itself, we are quite confident that he has furnished to us a faithful, albeit literal, transcript of it, and that the picture need not altogether fear being confronted with its great original." Is not this idea of a picture being confronted with its "great original" somewhat new in art and criticism? Let the reader imagine himself carrying Mr. Frankenstein's "Niagara" to the side of the fall itself, for the sake of an exact comparison!

Mr. Elihu Vedder has returned, after a two years' sojourn in Italy, and is exhibiting at Snedecor's Gallery, in the city, a number of his pictures. Mr. Vedder will be remembered by his Egyptian "Sphinx," and the "Sea-Serpent," each of which, a few years ago, was the talk in art circles. Mr. Vedder has always displayed great breadth, character, and force; his conceptions have been striking and original, and his mastery of color remarkable. But he always lacked finish, and we do not see that his sojourn abroad has improved his style in this particular. We have been too familiar with the exquisite finish in the pictures of Gê-

rome, Meissonnier, and Frère, to content ourselves with the almost rude performances of Mr. Vedder. The most striking subject in his present collection is "The Death of Abel," which exhibits the stark and stiff body of the first dead stretched by the side of the altar, which is erected in a hollow among hills of fearful and accursed barrenness. The painter has, of course, attempted, in the desolation of the landscape, to express the sentiment of the tragedy. Whether this is wisely done or not, judgments will differ.

Victor Hugo addressed the following letter to Madame Lamartine on the occasion of the death of her husband: "Madame—Since 1821 I have been closely united in heart with Lamartine. This friendship of fifty years has suffered to-day the momentary eclipse of death. I do not desire, at a moment like this, to cause you anguish by the expression of my sympathy; but, you will allow me, will you not—you who are united to him by blood, you who loved him, and whom he loved—to feel profound sorrow? Lamartine has all the degrees of glory, from popularity to immortality—a magnificent poet, and an orator whose fame is everlasting. To us he seems dead. He is not so! Lamartine has not ceased to shine; he has now a double splendor—in our literature, where he is a spirit, and in the great unknown life, where he is a star. With my kindest respects, VICTOR HUGO."

There seems to be an increasing demand for translations of foreign books. Our own authors are doing so little, that publishers are probably glad to go abroad for material, and, no doubt, the reading public are becoming more cosmopolitan in their tastes. Since the time of Fredrika Bremer, we have had little of Swedish literature. The Messrs. Peterson, of Philadelphia, however, have just reprinted a novel of Victor Rydberg, translated from the Swedish, and called "The Last Athenian," which was pronounced by Miss Bremer "the best and most genial historical novel ever written in the Swedish language." The work, moreover, stands so high in the estimation of Swedish *scenists*, that the professors of two Swedish universities, Upsala and Lund, recommend the work to the students as a faithful portrayal of classical manners and customs.

There are movements making, both in London and New York, looking to the opening of museums and picture-galleries on Sundays. In London, "The Working-men's Lord's Day Rest Association" have met to protest against the movement, and were addressed by Lord Shaftesbury. In New York there is an attempt to induce the trustees of the Mercantile Library to open their reading-room on Sundays; and, a week or two ago, a picture-gallery on Broadway gave sanction to the proposed change by advertising the exhibition as open to visitors on Sunday during daylight hours.

The London *Daily News* protests against the practice of making the observance of Lent an excuse for fresh frivolities in the matter of dress. The Forty Days are made a new motive for changes, coquetties, and caprices in the adornment of our fashionable women; and, not in dress alone—for, during this period, it is quite the thing to invent new forms of amusement, which shall exclude dancing, but which will have some piquant novelty. "Lenten entertainment" nowadays does not mean any limitations in enjoyment, either in eating, drinking, or in amusements, but simply the doing of something different from what is done at other seasons.

In an article on "Ruskin as a writer on art," Mr. W. M. Rossetti contends that the influence of Ruskinism is fast dying out, and that consequently "the pre-Raphaelitism which it brought into fashion is likely to give place to natural art, harmonious colors, and undecaying things of beauty."

Jules Janin, in a recent feuilleton, tells a very amusing story of Liszt, who, together with Rubini, gave a concert in a provincial town, to which only fifty persons came. The audience proving somewhat indifferent to Liszt's playing, the great pianist suddenly ceased performing, saying that he would offer his hearers no more music, but would invite them to supper instead. The invitation, after a little hesitation, was accepted, and Liszt had to pay twelve hundred francs for his joke.

Lord Brougham died without assets. He had made over all his property to his brother, who, in return, provided for all expenses—aversion to trouble about money matters being the reason.

The *Pall Mall Gazette* thinks that, if Lord Macaulay had lived to read Dixon's "Her Majesty's Tower," he would have repented more than he did of the false taste and stilted *staccato* manner which his "Essay on Milton" introduced into English literature.

Birket Foster, famous so long as one of the best landscape draughtsmen on wood, and more recently admired for his delightful water-color pictures, is about to exhibit, at the Royal Academy, his first attempt in oil. It will be a coast scene.

Some original manuscripts of poems by Burns were recently sold at auction in London.

## The Museum.

ONE of the most curious and interesting reptiles which I met with in Borneo was a large tree-frog, which was brought me by one of the Chinese workmen. He assured me that he had seen it come down, in a slanting direction, from a high tree, as if it flew. On examining it, I found the toes very long, and fully webbed to their very extremity, so that, when expanded, they offered a surface much larger than the body. The fore-legs were also bordered by a membrane, and the body was capable of considerable inflation. The back and limbs were of a very deep shining green color, the under surface and the inner toes yellow, while the webs were black, rayed with yellow. The body was about four inches long, while the webs of each hind foot, when fully expanded, covered a surface of four square inches, and the webs of all the feet together about twelve square inches. As the extremities of the toes have

dilated disks for adhesion, showing the creature to be a true tree-frog, it is difficult to imagine that this immense membrane of the toes can be for the purpose of swimming only, and the account of the Chinaman, that it flew down from the tree, becomes more credible. This is, I believe, the first instance known of a "flying frog," and it is very interesting to Darwinians, as showing that the variability of the toes, which have been already modified for purposes of swimming and adhesive climbing, has been taken advantage of to enable an allied species to pass through the air like the flying lizard. It would appear to be a new species of the genus *Rhacophorus*, which consists of several frogs of a

much smaller size than this, and having the webs of the toes less developed.—*Alfred Russell Wallace.*

Bernard Palissy, the great improver of pottery-ware, constructed a curious piece of rustic art, designed to represent an ancient grotto. "It was a large ornamental structure, scooped out of the ground; the walls of it were made to imitate rocks roughly hewn with a pickaxe; the arched ceiling was supported by columns and pilasters; medallions formed projections at intervals, where busts of heroes were raised on small pedestals. In the centre there was a fountain that played, and seemed to lend life and animation to a world of artificial reptiles and fishes lying unperceived until the eye became accustomed to the semi-darkness of the spot. On the gravel, seen through the translucent water of the stream, a carp or two, and a pike, or jack, heave lazily; a snake along the edge pursues a frog, a lizard is watching a butterfly, while a tortoise drags on its weight, and, amidst soft masses and bending reeds, in the bed of the stream, you see a crab and crawfish gliding. In another place he wishes that all the creatures he has sculptured and enamelled should be placed in a spot accessible to nature, so that natural serpents or lizards should often come and admire them."

The earth is nearly as heavy as it would be if its mass were entirely composed of metallic antimony or cast-iron.

The whole character of the face of a child results from the fleshy parts and integuments being calculated, if I may use such a term, for the support of larger bones than they possess in early years. The features are provided for the growth and development of the bones of the face, and hence the fulness, roundness, and chubbiness of infancy.—*Sir Charles Bell.*

## APPLETONS' JOURNAL

OF LITERATURE, SCIENCE, AND ART.

Price 10 cents per number; \$4.00 per annum, in advance.

### CONTENTS OF NO. 5, MAY 1, 1869.

EDITIONS IN BOTH FRENCH AND ENGLISH.

WILL BE PUBLISHED APRIL 24th,

## SEA AND NIGHT;

BEING PART FIRST OF

VICTOR HUGO'S NEW NOVEL,

ENTITLED

### The Man who Laughs; or, by the King's Command.

In one volume, octavo. Paper cover. Price, 50 cents.

VICTOR HUGO's remarkable novel, now publishing in APPLETONS' JOURNAL, will appear in several parts. The first part, under the sub-title of "Sea and Night," completed in the fifth number of the JOURNAL, will be issued on the day announced above. The remaining parts will be printed in book form as rapidly as completed in the JOURNAL.

ON APRIL 24th, IN FRENCH,

LA MER ET LA NUIT,

PREMIERE PARTIE.

## L'HOMME QUI RIT,

PAR VICTOR HUGO.

Un volume, broché. Prix, 50 cents.

The French edition of Victor Hugo's novel corresponds in size with the English edition, and will be sold at the same price.

Orders solicited from the Trade.

D. APPLETON & CO., Publishers, 90, 92 & 94 Grand St., N. Y.

## GORHAM MANUFACTURING CO.,

PROVIDENCE, R. I.,

### STERLING SILVER WARE

AND

### FINE ELECTRO-PLATED WARE.

This Company, having the most extensive and complete Silver-Ware Factory in the world, and employing the best talent in designing, modelling, and finishing, are, with the aid of ingenious and labor-saving machinery, enabled to produce in large quantities, and at the lowest prices, goods beautiful in design and unsurpassed in finish, the fineness of which they guarantee to be of sterling purity, U. S. Mint assay. A certificate is issued with all articles in silver, for the purpose of protecting purchasers from imitations of their designs.

They also continue to manufacture their well-known and unrivalled Nickel-Silver Electro-Plated Ware, which will last twenty-five years with fair every-day usage.

Orders received from the Trade only, but these goods may be obtained from responsible dealers everywhere.

ENTERED, according to Act of Congress, in the year 1869, by D. APPLETON & CO., in the Clerk's Office of the District Court of the United States for the Southern District of New York.

No. 6.—WITH PLATE.]

SATURDAY, MAY 8, 1869.

[PRICE TEN CENTS.]

THE MAN WHO LAUGHS;  
OR,  
BY THE KING'S COMMAND.

BY VICTOR HUGO.

PART II.—BY THE KING'S COMMAND.

BOOK I.—ETERNAL PRESENCE OF THE PAST; MEN THROW  
LIGHT UPON MAN.

I.—LORD CLANCHARLIE.

I.

In those times there was an old tradition.

The tradition of Lord Linnæus Clancharlie.

Baron Linnæus Clancharlie, a contemporary of Cromwell, was one of the few English peers, let us say at the outset, who had accepted the republic. This acquiescence might have been reasonable, and could be explained if necessary, since the republic had triumphed for an instant. It was perfectly simple that Lord Clancharlie should have been on the side of the republic, so long as the republic had the upper hand. But Lord Clancharlie had persisted, after the winding up of the revolution and the fall of the Parliamentary government. It would have been easy for his lordship to reënter the reconstructed upper house; penitents are always well received by restored monarchs, and Charles II. was a kind prince to those who came back to him; but Lord Clancharlie had not understood the moral of events. While the nation was welcoming its king with cheers, as he regained possession of England; while the verdict in his favor was unanimous; while the people were lavishing their salutes upon the monarchy; while the dynasty was raising its head again in the midst of a glorious and triumphal palinode; at the moment when the past was becoming the future, and the future the past, this nobleman had remained contumacious. He had averted his head from all this festivity; he had gone into voluntary exile; he had preferred being an outlaw, when he might have been a peer; and thus his years had rolled on; he had grown old in his fidelity to the dead republic. And, therefore, he was covered with the ridicule which naturally attaches itself to such childishness.

He had retired to Switzerland. He lived in a sort of palatial ruin on the borders of the Lake of Geneva. He had chosen for himself this dwelling in the most rugged recess of

the lake, between Chillen, the dungeon of Bonnivard, and Vevay, the tomb of Luc'low. He was enveloped by the stern Alps, teeming with twilight and wind and cloud; there he lived, lost in the great shadows which mountains cast. Seldom did a traveller meet him. The man was not only out of his country, he was almost out of his age. At that time no resistance to circumstances was justifiable for those who knew and kept up with what was going on. England was happy; a restoration is a reconciliation of man and wife; king and people had ceased to live apart. Nothing could be more graceful and promising; Great Britain was radiant; it is much to have a king, but they had a charming king to boot; Charles II. was amiable, was a statesman and a man of the world, and great after the example of Louis XIV.; he was a gentleman and a nobleman; Charles II. was admired by his subjects; he had made the Hanoverian war, nobody but himself knew why; he had sold Dunkirk to France, a great political measure. The democratic peers, of whom Chamberlayne says, "The accursed republic infected many of the nobility with its foul breath," had been sensible enough to yield to reason, conform to their epoch, and reassume their seats in the upper house. All they had to do for this was to take the oath of allegiance. When one reflected on all these realities, on this beautiful reign, this excellent king, these august princes restored by divine mercy to the love of their people; when one remembered that personages of consequence, like Monk, and afterward Jeffreys, had rallied round the throne; that they had been justly rewarded for their loyalty and zeal by the most magnificent dignities and the most lucrative offices; that Lord Clancharlie could not be ignorant of the fact, that it depended only on himself to be seated gloriously alongside them in all honor; that England, thanks to her king, had again reached the summit of prosperity; that London was all banquets and pageants; that everybody was rich and enthusiastic; that the court was gallant, gay, and proud—then if, by chance, afar from these splendors, in an indefinite, gloomy semi-daylight that resembled the nightfall, one saw this old man dressed in the same garb as the common people, pale, absent, bent with years, probably on the brink of the grave, standing near the lake, scarcely heeding tempest or winter, walking as if at random, his eyes fixed, his gray hairs tossed by the shadowy blasts, silent, solitary, pensive, it would have been hard not to smile.

A profiled sketch of a madman, as it were.

Thinking of Lord Clancharlie, what he might have been and what he was, to smile was charitable. Some laughed out loud. Others were indignant.

\* Entered, according to Act of Congress, in the year 1869, by D. APPLETON & Co., in the Clerk's Office of the District Court of the United States for the Southern District of New York.

It is clear that serious men might have been disgusted with such insolence in holding himself aloof.

One extenuating circumstance there was: Lord Clancharlie had never been a man of capacity. Every one was agreed on that point.

## II.

It is disagreeable to see people make a business of obstinacy. Such imitations of Regulus are unpopular, and provoke irony in public opinion.

These headstrong persons are living reproaches; one has a right to laugh at them.

And then, after all, is this stubbornness, this ruggedness, a virtue? Is there not much ostentation in this excessive show of self-denial and honor? It is more display than any thing else. Why these exaggerations of solitude and exile? To carry nothing too far is the wise man's maxim. Make opposition—well and good; find fault, if you will—but decorously, and without ceasing to cry, "God save the king!" True virtue consists in being reasonable. That which falls ought to fall; that which succeeds, to succeed. Providence has its reasons, and crowns the deserving. Do you pretend to know more about these things than Providence? When facts have spoken, when one government has replaced another, when success has eliminated the true and the false, on one hand ruin, on the other triumph, no more doubt is possible. The honest man attaches himself to the winning side; and, although this benefits his fortune and family, without letting himself be influenced by any such consideration, and thinking only of the public weal, he gives his aid to the conqueror.

What would become of the state, if no one consented to hold office? Is every thing to stop? It is the part of a good citizen to keep his place. Learn to sacrifice your secret preferences. Offices require to be filled. Some one must devote himself. To be faithful to your public functions, is one sort of fidelity. Abandoned by its functionaries, the state would be paralyzed. It is childish to banish yourself. Do you mean it for an example? What vanity! For a defiance? What impudence! What great man do you suppose yourself to be? Know that we are as good as you. We don't desert our posts, not we! If we chose, we too could be inaccessible and untamable—that we could; and we could do worse things than you. But we prefer to be sensible people. Because I am Trimalcion, you don't think me capable of being Cato!

Nonsense!

## III.

NEVER was situation more clear and decided, than that of affairs in 1660. Never had the course to pursue been more clearly marked out to a man of sense.

England was free from Cromwell. Under the republic, many irregular actions had been committed. British supremacy had been created; the English, with the help of the Thirty Years' War, had subdued Germany; with the help of the Fronde, humbled France; with the help of the Duke of Braganza, curtailed Spain. Cromwell had tamed Mazarin; the Protector of England signed his name to a treaty above that of the French king. He had fined the United Provinces eight millions, disturbed Algiers and Tunis, conquered Jamaica, humiliated Lisbon, raised up a French faction in Barcelona and Masaniello in Naples; he had moored Portugal to England, and made a clean sweep of the Barbary pirates, from Gibraltar to Candia. The dominion of the seas had been founded under the double form of victory and trade. On the 10th of August, 1653, the man who had won thirty-three fights, the old admiral who called himself *grandfather of sailors*, the Martin Happestz Tromp, who had beaten the Spanish fleet, had been destroyed by the English fleet; the Atlantic had been wrested from the Spanish navy, the Pacific from the Dutch navy, the Mediterranean from the Venetian, and, by the act of navigation, the sea-coast of the world had been occupied. By means of the ocean, the earth was held in subjection; the Dutch flag hum-

bly saluted the British at sea; France, in the person of her ambassador Mancini, did reverence to Oliver Cromwell; this Cromwell played with Calais and Dunkirk as with two shuttle-cocks; he had made the continent tremble, dictated peace, declared war, planted the English standard on every pinnacle; the Protector's one regiment of Ironsides outweighed an army in the balance of Europe's fears. Cromwell used to say, *It is my will that the English republic shall be respected as the Roman republic was*. There remained no longer any thing sacred; speech was free, the press was free; men said in the open street what they chose, they printed without control or censorship what they wished; the balance of power had been disturbed; all the monarchical institutions of Europe, whereof the Stuarts were part, had been turned upside down. Finally, England had escaped from this odious government and received her pardon.

The indulgent Charles II. had promulgated the Declaration of Breda. He had granted to England oblivion of that epoch, when the son of a Huntingdon brewer placed his foot on the head of Louis XIV. England uttered her *mea culpa*, and breathed again. The expansion of hearts, as we have just said, was complete, the regicides' gibbets adding to the universal joy. A restoration is an affair of smiles; still, a trifle of gallows is not unbecoming, and the public conscience must be satisfied. The spirit of insubordination was scattered; loyalty was reestablishing itself. Henceforth the only ambition was to be a good subject. Men had recovered from their political follies, they scoffed at the revolution, they ridiculed the republic, and the queer times when people had always big words in their mouth, *Right, Liberty, Progress*; how they laughed at these emphatic terms! It was an admirable return of good sense; England had been dreaming. What happiness to be free from these delusions! Was there any thing more crazy? Where should we be, if every vagabond had his rights? Imagine everybody governing! Can you fancy the city directed by the citizens? The citizens are a team, and the team isn't the coachman. Putting a matter to the vote is throwing it to the winds. Would you make states float about like clouds? Disorder does not construct order. If Chaos is the architect, the building will be Babel. And then what a tyranny this pretended liberty is! I want to amuse myself, I do, and not to govern. Voting is a bore; I prefer to dance. What a godsend is a prince, who takes charge of every thing! Surely the king is generous, to take this trouble for us. And then he was brought up to it; he knows what it is; it is his business. Peace, war, legislation, finance—is that the people's business? Doubtless the people must pay and work, but that ought to be enough for them. They have their part in politics; they contribute the two forces of the state, the army and the purse. To be a taxpayer and a soldier, is not that enough? What more do the people want? They are the right arm of the General and of the Treasurer—splendid position! The king reigns for it; surely this service must be recompensed. Taxes and civil lists are the wages which nations pay and princes earn. The people give their blood and their money in return for being led. Wish to direct itself? What a strange idea! A guide is necessary for them. Being ignorant, they are blind. Has not the blind man a dog? Only for the people it is a lion, the king, who consents to be their dog. What goodness! But why are the people ignorant? Because it must be so. Ignorance is the guardian of virtue. Where there is no perspective, there is no ambition; the ignorant man is enveloped in a beneficial darkness, which quenches his desires by quenching his sight. Hence comes innocence. He, who reads, thinks; he, who thinks, reasons. It is our duty and also our happiness not to reason. These truths are incontestable. Society reposes on them.

Thus were sound social doctrines reestablished in England. Thus was the nation restored to virtue. At the same time there was a reaction in favor of fine literature. Shakespeare was

despised and Dryden admired. *Dryden is the greatest poet of England and of the age*, said Atterbury (who translated *Achitophel* into French). This was the time when M. Huet, Bishop of Avranches, wrote to Salmasius, who had done the author of *Paradise Lost* the honor of refuting and abusing him, *How can you occupy yourself with an object so insignificant as this Milton?* Every thing revived and reoccupied its place. Dryden up, Shakespeare down, Charles on the throne, Cromwell on the gibbet. England was recovering from the shameful extravagances of the past. It is a great blessing for nations to be brought back, by monarchy, to good order in the state and good taste in literature.

It is hard to believe that such benefits could be unappreciated. Was it not abominable to turn one's back on Charles II., and repay with ingratitude his magnanimity in reascending the throne? Lord Linnaeus Clancharlie had caused this scandal to respectable persons. What madness to sulk at the happiness of his country!

In 1650, as is well known, the Parliament had decreed this form, *I promise to remain faithful to the republic, without king, sovereign, or master*. Under pretext that he had taken this monstrous oath, Lord Clancharlie remained out of the kingdom, and, in face of the general happiness, thought he had a right to be sad. He had a melancholy esteem for that which no longer existed; a strange attachment to vanished objects.

To excuse him was impossible; the most benevolent gave him up. His friends had for a long time done him the honor to suppose that he had joined the republican ranks, only to see more nearly the weak points in the republic's armor, and to strike it with more certainty, when the time came, to the benefit of the king's holy cause. It is part of a loyalist's duty to wait thus for the fit hour, when he can stab the enemy from behind. And this was hoped of Lord Clancharlie, so predisposed were people to judge him favorably. But, in presence of his strange persistence in republicanism, it was soon necessary to renounce this good opinion. Evidently Lord Clancharlie was sincere, that is to say, an idiot.

The explanations of the charitable hesitated between childish obstinacy and headstrong dotage.

Stern judges went farther. They stigmatized this heretic. Weakness has its privileges, but it has bounds. One may be stupid; one ought not to be rebellious. And then, after all, what was Lord Clancharlie but a deserter? He had left his camp, the aristocracy, to go over to the hostile camp, the people. This faithful disciple was a traitor. To be sure, he was "traitor" to the strongest and faithful to the weakest side; to be sure, the camp rejected by him was the victorious camp, and the camp adopted by him the vanquished; to be sure, he lost every thing by this treason, his political privileges, and his domestic hearth, his peerage and his country; his only gain was ridicule, his sole profit exile. But what did that prove? That he was a blockhead.

Granted.

Traitor and dupe at the same time—such there are.

One may be a simpleton to one's heart's content, on condition of not setting a bad example. It is only required of simpletons that they be honest; with which provision, they can set themselves up as the founders of monarchies. The paucity of this Clancharlie's wits was inconceivable. He had remained dazzled by the revolutionary phantasmagoria. He had allowed himself to be tricked by the republic, at home and abroad. He affronted his country. His attitude was pure felony. To be absent, is to be reproachful. He seemed to hold himself aloof from the public welfare, as from the plague. In his voluntary banishment, there was, as it were, a refuge from the national satisfaction. He treated royalty as a contagion. He was the black flag over the vast monarchical enthusiasm denounced by him as a lazar-house. What! with order reestablished, the nation raised up again, religion restored—throw a shade upon all this serenity! Take amiss contented England! Be the dark

spot in the great blue sky! Resemble a menace! Protest against the national will! Refuse his "yes" to the universal assent! This would be odious, if it were not comical. The Clancharlies had not taken into account that one may go astray with Cromwell, but that one must come back with Monk. Look at Monk! He commands the army of the republic. Charles II., informed of his probity, writes to him. Monk, who combines a virtuous tone with crafty doings, dissimulates at first; then, all at once, at the head of his troops, breaks up the factious Parliament and reestablishes the king. And Monk is created Duke of Albemarle, has the honor of having saved society, becomes very rich, confers undying lustre upon his epoch, and is made a Knight of the Garter, with the prospect before him of being buried at Westminster. Such is the glory of a faithful Englishman. Lord Clancharlie had not been able to raise himself to the comprehension of duty thus put in practice. He had within him the infatuation, and the immobility, of exile. He satisfied himself with hollow phrases. The man was stiffened in the joints by pride. The words "conscience," "dignity," etc., are words, after all. One must look to the substratum.

This substratum Clancharlie had not seen. His was a short-sighted conscience; anxious, before committing an action, to examine it so closely as to inhale its odor. Thence, absurd disgusts. With such refinements, there is no such thing as a statesman: Excessive conscientiousness degenerates into infirmity. Scrupulousness is one-armed before a sceptre to be seized, and a eunuch before a fortune to be espoused. Mistrust scruples. They lead a long way. Unreasonable fidelity has its descents, like a cellar stairway. One step, then another step, then still one more step, and you find yourself in the dark. The shrewd mount up again; the simple-minded remain. One should not too readily allow the conscience to entangle itself in the severe. From transition to transition, you reach the deeply-tinted shades of political bashfulness. Then you are lost. This is what happened to Lord Clancharlie.

Principles, in the end, become a bottomless pit.

He was strolling with his hands behind his back, along the shores of the Lake of Geneva. A pretty step in advance!

Sometimes, in London, they spoke of the absentee. He was, in public opinion, almost in the position of an accused person. There were pleadings for him, and against him. When the cause was heard, the benefit of stupidity was awarded him.

Many of the former zealots of the ex-republic, had given in their adhesion to the Stuarts; for which they merit praise. Naturally, they calumniated him a little. The obstinate are troublesome to the complaisant. Witty folks, well regarded and well placed at court, and annoyed at his disagreeable attitude, volunteered to say: "If he has not joined us, it is because he has not been sufficiently well paid," etc. "He wanted the place of Chancellor, that the king has conferred upon Lord Hyde," etc. One of his "old friends" went so far as to whisper—"He told me so, himself." At times, all lonely as was Linnaeus Clancharlie, some of this tattle reached him, now from exiles whom he encountered, now from old regicides, such as Andrew Broughton who was living at Lausanne. Clancharlie did but shrug his shoulders imperceptibly—a sign of profound stupidity. Once, he gave the finishing touch to this shrugging of the shoulders, by these few muttered words.

— I pity those who believe it.

IV.

CHARLES II., good man, treated him with disdain. The happiness of England, under Charles II., was more than happiness; it was enchantment. A restoration is an old picture blackened with age, that is revivified; all that had passed away reappears. The good old manners made their reëntry; pretty women reigned and governed. Evelyn has noticed this fact; you may read in his diary: "Lewdness, profanation, contempt of God. I have seen the king, on a Sunday evening, with his mistresses, Portsmouth, Cleveland, Mazarin, and two

or three others, all half-naked, in the gallery devoted to play." A certain degree of ill-humor is seen to peer out of this sketch; but Evelyn was a Puritan grumbler, infected with republican reveries. He did not appreciate the profitable example that monarchs give by these grand Babylonian revels, which, after all, are the support of luxury. He did not comprehend the utility of vices. Rule: do not extirpate vices, if you wish to have women charming. Otherwise, you will be like the noodles who destroy caterpillars, while all the while doating on butterflies.

Charles II., as we have just remarked, scarcely perceived the existence of a rebel named Clancharlie; but James II. was more attentive. Charles II. governed indulgently—it was his mode; let us add, that he therefore governed none the worse. A seaman sometimes makes a loose knot in a rope intended to hold fast against the wind, leaving the wind to draw it tight. Such is the senselessness of tempests and of peoples.

This loose knot, speedily converted into a tight one, was the government of Charles II.

Under James II., stifling began—the needful stifling of what remained of the revolution. James II. was laudably ambitious of being an effective sovereign. The reign of Charles II. was, in his eyes, only the rough draft of restoration; James II. desired a return to order more perfected still. He had, in 1660, regretted that the hanging of the regicides was limited to ten. He was a more real reconstructor of authority; he infused vigor into serious principles. He brought about the reign of that justice which is the true one, which ranges itself above sentimental declamations, and which is, in the main, preoccupied with the interests of society. In these protective severities, one recognizes the father of the State. He confided the hand of justice to Jeffreys, and the sword to Kirke. Kirke multiplied examples. This practical colonel had the same man, a republican, hung, and rehung three times, in one day, asking him on each occasion: "Dost thou abjure the republic?" and the wretch, having invariably said "no," was finished off. "I have hung him four times," said Kirke, satisfied. Corporal punishments, recommenced, are a decided sign of strength in the executive. Lady Lyle—notwithstanding that she had sent her son on the campaign against Monmouth—had concealed in her house two rebels, and was put to death. Another rebel, having had the honesty to declare that an Anabaptist woman had sheltered him, was pardoned, and the woman was burnt alive. Kirke, on another day, gave a town to understand that he knew it to be republican, by hanging nineteen of its citizens. Reprisals very legitimate assuredly, when one reflects that, under Cromwell, the ears and noses of saints in stone were cut off in the churches. James II., who had known how to pick out Jeffreys and Kirke, was a prince imbued with true religion. He mortified himself by the ugliness of his mistresses; he listened to Father La Colombière, a preacher who was almost as unctuous as Father Cheminai, but with more fire, and who had the glory of being, in the former half of his life, the counsellor of James II., and in the latter the inspirer of Marie Alacoque. It was owing to this strong religious nourishment that, at a later period, James II. was enabled to bear exile worthily, and to offer, in his retreat at St. Germain, the spectacle of a monarch superior to adversity, touching calmly for the king's evil, and holding converse with Jesuits.

You understand how such a king was compelled, in a certain measure, to preoccupy himself with such a rebel as Lord Linnaeus Olancharlie. Transmissible hereditary peerages involving the future to some extent, it was evident that, if any precaution with regard to this lord was to be taken, James II. would not hesitate.

## II.

### LORD DAVID DIRRY-MOIR.

#### I.

LORD LINNÆUS OLANCHARLIE had not always been old and proscribed. He had had his phase of youth and passion. We know, from Harrison and Pride, that the young Cromwell

had loved women and pleasure, which sometimes (another view of the feminine question) foreshadows sedition. Be on your guard against loose dressing. *Male præcinctum juvenem cavete.*

Like Cromwell, Lord Clancharlie had had his weaknesses and his irregularities. He was known to have had a natural child, a son. This son, brought into the world at the moment when the republic was coming to an end, was born in England as his father was setting out on his exile. This is why he had never seen the father whom he owed. This bastard of Lord Clancharlie had grown up a page at the court of Charles II. He was called Lord David Dirry-Moir; he was a lord by courtesy, his mother being a woman of rank. This mother, while Lord Clancharlie was becoming an owl in Switzerland, made up her mind, being handsome, to look less sour; and obtained pardon for her first wild lover, by means of a second, this latter incontestably a tamed and even a royalist one, for it was the king. She was to some extent the mistress of Charles II.; so much so, that his majesty, charmed at having recaptured this pretty woman from the republic, gave the little Lord David, son of the conquered one, a commission as yeoman of the mouth. Lord David was, for some time, a yeoman of the mouth, one of the hundred and seventy wearers of the long sword; then he entered the band of pensioners, and was one of the forty who carry a gilded halbert. He had besides, being of this noble body, established by Henry VIII. for guarding his person, the privilege of placing the dishes upon the king's table. Thus it was that, while his father was growing gray in exile, Lord David prospered under Charles II.

After which, he prospered under James II.

"The king is dead, long live the king!" is the *non deficit alter aureus*.

It was at this accession of the Duke of York, that he obtained permission to call himself Lord David Dirry-Moir, from a lordship that his lately-deceased mother had bequeathed him, in that vast Scottish forest wherein is found the bird krag, which, with its beak, hollows out its nest in the trunk of an oak.

## II.

JAMES II. was a king, and pretended to be a general. He liked to surround himself with young officers. Willingly did he exhibit himself to the public, on horseback, with helmet and cuirass, and vast overflowing wig, passing out from below the helmet above the cuirass; a sort of equestrian statue of War at child's play. He took a fancy to the graceful air of the young Lord David. He took it kindly of this royalist, the being a republican's son; a repudiated father does not stand in the way of a court-fortune that is starting. The king made Lord David a gentleman of the bedchamber, with a salary of a thousand pounds.

This was fine promotion. A gentleman of the bedchamber sleeps, every night, near the king, upon a bed prepared for him. There are twelve gentlemen. They relieve each other.

Lord David, in this post, was at the head of the king's granary; and his duty it was to supply oats for the horses, having two hundred and sixty pounds for his wages. He had under him the king's five coachmen, the king's five postillions, the king's five grooms, the king's twelve footmen, and the four porters of the king's chair. He had the ordering of the six race-horses that the king keeps at Haymarket, and which cost his majesty six hundred pounds a year. He disposed of every thing in the king's wardrobe, which furnishes state-dresses for the Knights of the Garter. The usher of the Black Rod, pertaining to the king, bowed to the ground before him. This usher, under James II., was the Chevalier Duppa. Lord David received homage from Mr. Baker, who was Clerk of the Crown, and from Mr. Brown, who was Clerk of Parliament. The English court, in its magnificence, is a patron of hospitality. Lord David presided, as one of the twelve, at table and at receptions. His was the glory of standing up behind the king, on days of

offering, when the king presents to the Church the besant of gold, *byzantium*; on the collar-days, when the king wears the collar of his order; and on communion-days, when no one but the king and the prince partakes of the communion. He it was, who, on Holy Thursday, introduced to his majesty the dozen paupers, to whom the king gives as many silver pennies as the years he has lived, and as many shillings as the years he has reigned. It was his function, when the king was ill, to call to his majesty's aid the two grooms of the almonry, who are priests, and to prevent the approach of physicians without permission of the Council of State. Furthermore, he was lieutenant-colonel of the Scotch regiment of the Royal Guard, which beats the march of Scotland.

In this capacity he went through several campaigns, and with much *éclat*, for he was a valiant man of war. A brave nobleman was he; well made, handsome, generous, and very imposing in air and manner. He was tall in person, as he was elevated by birth.

There was a moment when he came near being nominated groom of the stole, which would have given him the privilege of putting on the king's shirt; but, for this office, one must be prince or peer.

The creation of a peer is a great affair. It is to create a peerage; and this causes jealousy. It is a favor; and a favor makes for the king one friend and a hundred enemies, without reckoning that the friend becomes ungrateful. James II., from policy, created peerages rarely; but he readily transferred them. A peerage transferred brings about no scandal. It is only a title continued. Their lordships are little troubled by it.

The royal good-will did not shrink from introducing Lord David Dirry-Moir into the Upper Chamber, provided it was through the door of a substituted peerage. His majesty asked no better than to have an opportunity for making of David Dirry-Moir, the lord by courtesy, a lord by right.

### III.

This opportunity offered itself.

One day came the news that divers things had happened to the old absentee, Lord Linnaeus Clancharlie, of which the principal was that he had died. Death has this of good in it for people—it gives rise to a little talk concerning them. What was known, or what was thought to be known, of the later years of Lord Linnaeus was told over. Conjectures probably, and fables. To believe these stories, doubtless very far-fetched, Lord Clancharlie, toward the close of his life, had experienced such a republican revivification as to be induced to marry—so the tale went—with an exile's strange stubbornness, a daughter of one of the regicides, Ann Bradshaw. They had the name exactly; and reported further, that she too was dead, but in bringing into the world a child, a boy, who, if all the details were exact, would find himself to be the legitimate and legal heir of Lord Clancharlie. These averments, very vague as they were, were more like rumors than facts. That which took place in Switzerland was, for England of that period, as far remote as what takes place in China for the England of to-day. Lord Clancharlie must have been fifty-nine at the time of his marriage, and sixty at the birth of his son, and must have died very soon afterward, leaving behind him this child, an orphan on the father's and mother's side. Possibilities, without doubt, but not probabilities. It was added that the child was "beautiful as the day," which one may read in any fairy tale. King James put an end to these reports, evidently without any foundation, by declaring, one fine morning, Lord David Dirry-Moir the sole and definitive heir of Lord Linnaeus Clancharlie, the natural father, *in default of legitimate issue* and by the royal good pleasure, *the absence of all other relations and descendants being established*, patents to which effect were registered in the chamber of peers. By these patents, the king appropriated to Lord David Dirry-Moir the titles, rights, and prerogatives of the said defunct Lord Linnaeus Clancharlie, on

the sole condition that Lord David should marry, when she was marriageable, a girl, then quite an infant and only some months old, whom the king had created a duchess in her cradle—one did not well know why. Read, if you please, that one did well know why. This little one was called the Duchess Josiane.

Spanish names were then the fashion in England. One of Charles the Second's bastards was called Carlos, Earl of Plymouth. It is probable that *Josiane* was the contraction of *Josefa-y-Anna*. Perhaps, however, there was Josiane, as there was Josias. One of Henry the Eighth's gentlemen was named Josias of Passage.

It was upon this little duchess that the king conferred the peerage of Chancharlie. She was peeress, while awaiting a peer. The peer would be her husband. This peerage was founded upon a double castellany, the barony of Clancharlie and the barony of Hunkerville; besides which, the Lords Clancharlie, in recompense for an old deed of arms and by royal permission, were Marquises of Corleone, in Sicily. The peers of England cannot bear foreign titles. But there are exceptions: thus, Henry Arundel, Lord Arundel of Wardour, no less than Lord Clifford, is a count of the Holy Empire, whereof Lord Cowper is a prince; the Duke of Hamilton is, in France, Duke of Chatelherault; Basil Feilding, Earl of Denbigh, is, in Germany, Count of Hapsburg, of Lauffenburg, and of Rheinfelden. The Duke of Marlborough was Prince of Mindelheim in Swabia, just as the Duke of Wellington was Prince of Waterloo in Belgium. The same Duke of Wellington was Spanish Duke of Ciudad-Rodrigo, and Portuguese Count of Vimeira.

There were in England, and there still are, noble estates, and estates held by mean tenure. The estates of the Lords Clancharlie were all noble. The estates, country-seats, townships, bailiwicks, fiefs, rents, manorial rights, and domains, attached to the Clancharlie-Hunkerville peerages, belonged provisionally to Lady Josiane, and the king declared that Josiane once espoused, Lord David Dirry-Moir should be Baron Clancharlie.

Besides the Clancharlie inheritance, Lady Josiane had her personal fortune. She possessed many valuables, several of which came from the gifts of Madame *sans queue* to the Duke of York. *Madame sans queue* is equivalent to saying simply *madame*. Thus they termed Henriette of England, Duchess of Orleans, the first woman in France, after the Queen.

### IV.

AFTER having prospered under Charles and James, Lord David prospered under William. His Jacobinism did not go to the length of following James II. into exile. Retaining all the while his attachment to his legitimate sovereign, he had the good sense to serve the usurper. He was, moreover, though with some disregard of discipline, an excellent officer; he passed from the army into the navy, and distinguished himself in the White squadron. He became therein what was called then "a captain of a light frigate." The upshot was the making him a finished gentleman, carrying to an extreme point the elegances of vice, something of a poet as every one was, a good servant of the state, a good prince's lackey, assiduous at fêtes, galas, levées, ceremonies, and battles, close-fisted as a man must be, very haughty, near-sighted or far-sighted, according to the object to be looked at, willing to be honest, obsequious, or arrogant on occasion, frank and sincere by impulse, but with privilege to put on his mask again; narrow observer of the royal humor good or bad, before a sword's point quite careless, always ready to risk his life with heroism and unconcern at a sign from his majesty, capable of any wanton insult, but of no impoliteness; a man of courtesy and etiquette, proud of bowing the knee on great monarchical occasions, of brilliant valor, externally a courtier, internally a knight, quite a young man at forty-five.

Lord David sang French songs, a gay accomplishment that had delighted Charles II.

He loved eloquence and fine language. He greatly admired

those celebrated parades of charlatanism that are called the *Oraisons Funèbres* of Bossuet.

From his mother's side, he had almost the wherewithal to live, a revenue of about ten thousand pounds sterling, that is to say two hundred and fifty thousand francs. He got through it, running into debt. In magnificence, extravagance, and novel-  
ties, he was without rival. So soon as any one imitated him, he changed his style. On horseback, he wore easy-fitting boots of calf-skin, turned over, with spurs. He had hats that no one else had, unheard-of lace, and cravats that were specially his own.

### III.

#### THE DUCHESS JOSIANE.

##### I.

ABOUT 1705, although Lady Josiane was twenty-three years of age, and Lord David forty-four, the marriage had not yet taken place, and this for the best reasons in the world. Did they hate each other? far from it. But that which cannot escape you does not excite impatience. Josiane wished to remain free; David wished to remain young. Not to get bound by the chain until the latest possible moment, this seemed to him a prolongation of his youth; young men, determined not to grow old, abounded in those gallant days; they grew gray as fops; the wig was an accomplice, and at a later period powder was an auxiliary. At fifty-five, Lord Charles Gerrard, Baron Gerrard, of the Gerrards of Bromley, filled London with the fame of his successes. The pretty and youthful Duchess of Buckingham, Countess of Coventry, was madly in love with the sixty-seven years of the handsome Thomas Ballasye, Viscount Falcomberg. One recalls the famous line of Corneille, the man of seventy, to a woman of twenty—

*Marquise, si mon visage.*

Women also had their autumnal triumphs; witness Ninon and Marion. Such were their models.

Josiane and David displayed in their coquetry a particular shade. They did not love each other; they pleased each other. To walk by each other's side was enough for them. Why should they hurry themselves to make an end of it? The love-stories of the time carried lovers and engaged people through this sort of probation, which was then much in vogue. Josiane, moreover, knowing herself base-born, felt herself a princess, and looked with some disdain upon these minor details. She had a fancy for Lord David. Lord David was fine-looking; but this was over and above the bargain. She found him fashionable.

To be fashionable is every thing. Caliban, fashionable and magnificent, quite distances Ariel, poor. Lord David was handsome, so much the better; the stumbling-block of being handsome is to be insipid; he was not. He gambled, he boxed, he ran in debt. Josiane made much of his horses, of his dogs, of his losses at play, of his mistresses. Lord David, for his part, submitted to the fascination of the Duchess Josiane, that haughty, unapproachable, and high-spirited girl, without blemish and without scruple. He wrote sonnets to her, which Josiane read sometimes. In these sonnets, he affirmed that to possess Josiane would be to mount up to the stars; but this did not hinder him from always postponing the ascension till next year. He danced attendance at the door of Josiane's heart, and this suited them both. At court, all admired the exceeding good taste of this putting off. Lady Josiane said, "It is provoking that I should be compelled to marry Lord David; I, who ask for nothing better than to be in love with him!"

Josiane was flesh. Nothing could be more magnificent. She was very tall, too tall. Her hair was of that shade which one may call a reddish blond. She was plump, fresh, robust, blooming, with inordinate audacity and wit. She had eyes that were only too easily understood. Lover she had none, and of purity little more. She walled herself round in her pride. Men, pshaw! a god, at the least, only was worthy of her, or a mon-

ster. If virtue consists in ruggedness, Josiane was all possible virtue, without the least innocence. She had had no adventures, through disdain of them; but one would not have offended her by supposing her to have had them, provided they should have been strange and suitable to a personage like herself. She cared little for reputation, and very much for notoriety. To seem facile and to be unattainable, here was the crowning excellence. Josiane felt herself majestic and material. Hers was a cumbersome beauty. She invaded, rather than charmed. She trampled upon hearts. She was earthly. One would have astonished her as much by showing her a soul in her bosom, as by showing her wings upon her back. She discoursed upon Locke. She had great polish of manners. She was suspected of knowing Arabic.

To be flesh and to be woman, are two things. Where woman is vulnerable—on the side of pity, for example, which so easily becomes love—Josiane was not vulnerable. Not that she was insensible. The old comparison of flesh with marble is absolutely false. The beauty of flesh is in being not marble; it is to palpitate, to tremble, to blush, to bleed; it is to have firmness without hardness; it is to be white without being cold; it is to have its starts and its weaknesses; it is to be life; and marble is death. Flesh of a certain degree of beauty has almost the right of nakedness; it covers itself with dazzling lustre as with a veil; he who might have seen Josiane naked would only have seen this piece of modelling through a dilating brilliancy of light. She would willingly have shown herself—to a satyr or a eunuch. She had a mythological composure. To make of her nudity a corporal punishment, to elude the grasp of a Tantalus, would have amused her. The king made her a duchess, and Jupiter a Nereid. Double irradiation of which the strange splendor of this creature was made up. In admiring her, one felt himself becoming a pagan or a lackey. Her origin was bastardy and the ocean. She seemed to rise out of the foam. The first jet of her destiny had threatened wreck, but in the middle portion it was regal. She had in her something of the wave, of chance, of nobility, and of the tempest. She was learned and well-read. Never a passion had approached her, and she had gone to the bottom of them all. She had a distaste for realizations, and a liking for them at the same time. If she had stabbed herself, it would have been, like Lucretia, afterward. All manner of corruption, in a fanciful state, was in this virgin. She was a possible Astarte in a real Diana. She was, by the insolence of high birth, exasperating and unapproachable. Nevertheless she might have found it diverting to get up for herself a fall. She dwelt, a glory in a nimbus, with a passive willingness to come down, and perhaps with the curiosity to tumble out of it. She was a little heavy for her cloud. Sinning is pleasant. The free and easy manner of a prince gives the privilege of the trial, and a ducal person amuses herself where a citizen's wife comes to ruin. Josiane was, on the whole, by birth, by beauty, by irony, and by brilliancy, almost a queen. She had had a moment of enthusiasm for Louis de Boufflers, who broke a horseshoe with his fingers. She regretted that Hercules was dead. She lived in an indefinable longing for an ideal, lascivious and supreme.

As to morality, Josiane made one think of the line in the Epistle to the Pisos—

*Desinit in piscem.*

The lovely form of a woman ends in a hydra.

It was a noble bust, a splendid bosom, harmoniously heaved by a royal heart, a bright, animated look, a countenance pure and haughty, and—who knows?—having under the water, in the dim and confused transparency, a prolongation undulatory, abnormal, perhaps cruel and deformed. Virtue superb, ending in vice, amid the depth of dreams.

##### II.

With all this a prude.

It was the fashion.

Remember Elizabeth.

Elizabeth is a type that has ruled in England for three centuries, the sixteenth, the seventeenth, and the eighteenth. Elizabeth is more than English, she is Anglican. Hence, the profound respect of the Episcopal Church for that queen; respect resented by the Catholic Church, which mixed her up with a little of excommunication. In the mouth of Sixtus Fifth anathematizing Elizabeth, the malediction turns out a madrigal. *Un gran cervello di principessa*, said he. Mary Stuart, less occupied with the Church question, and more occupied with the woman question, was little respectful to her sister Elizabeth, and wrote to her, the queen to the queen, and the coquette to the prude: "Your aversion to marriage proceeds from your not wishing to lose the liberty yourself of compelling people to make love to you." Mary Stuart played with a fan, and Elizabeth with the axe. Unequal match. Again, the two were rivals in literature. Mary Stuart made French verses; Elizabeth translated Horace. Elizabeth, ugly, decreed herself beautiful, loved quatrains and acrostics, caused the keys of towns to be presented to her by Cupids, pinched her lips like the Italians, and rolled her eyes like the Spaniards, had in her wardrobe three thousand gowns and toilettes, of which some were costumes of Minerva and Amphitrite, esteemed the Irish for the breadth of their shoulders, covered her farthingale with tinsel and spangles, doted on roses, swore, blasphemed, stamped with her feet in anger, struck with her fist her maids of honor, sent Dudley to the devil, beat Chancellor Burleigh, who whimpered, the old fool, spit upon Mathew, throttled Hatton, boxed Essex on the ears, showed her thigh to Bassompierre, was a virgin.

What she did for Bassompierre the Queen of Sheba had done for Solomon.\* Wherefore it was correct, Holy Scripture having established the precedent. That which is Biblical may be Anglican. Biblical precedent goes so far even as to create a child who calls himself Ebnehaquem or Melilechet, that is to say, *le Fils du Sage*.

Why not these manners? Barefaced wickedness is better than hypocrisy.

To-day England, who has a Loyola called Wesley, averts her eyes a little from the past. She is annoyed by it, but proud of it.

During the reign of these manners, the taste for deformity prevailed, especially with the women, and, singularly enough, with the pretty women. What was the use of being pretty, if one could not keep a little monster? What was the use of being queen, if one might not be called pet-names by an obese Chinese? Mary Stuart had had her "weakness" for her crooked Rizzio. Maria Theresa, of Spain, had had "a little familiarity" with a negro. Whence the *Black Abbe*s. In the alcoves of the august century the hunch was not much out of place; witness Marshal Luxembourg.

And before Luxembourg, Condé, "that little man who was so pretty."

Pretty women themselves might, without inconvenience, be deformed. This was allowed. Anne Boleyn had one breast larger than the other, six fingers on one hand, and a tusk. La Vallière was bandy-legged. This did not hinder Henry VIII. from being a fool, or Louis XIV. from becoming demented.

In morals, there were the same deviations. Nearly every woman of high rank was a case of monstrous organization. Agnes contained Melusina. One might be a woman by day, and a vampire by night. They went to the place of execution, to kiss the heads just cut off on the iron stake. Margaret of Valois, a grandmother of prudes, wore at her girdle, under padlock, in tin boxes, sewed to the body of her petticoat, all the hearts of her dead lovers. Henry IV. was concealed under this farthingale.

In the eighteenth century, the Duchess of Berry, daughter of the Regent, revived in one obscene and royal type all these creatures.

\* Regina Saba coram rege crura denudavit.—Schickel. in Proemio Tarich Jemici, F. 65.

Besides, the fair dames knew Latin. It was, during the sixteenth century, a feminine accomplishment. Jane Grey pushed this refinement even to the knowledge of Hebrew.

The Duchess Josiane latinized. More than this, another pretty custom, she was a Catholic. In secret, let us say, and more after the manner of her uncle Charles II. than of her father James II. James had sacrificed his kingdom to his Catholicism, and Josiane had no desire of risking her peerage. For this reason, Catholic as she was in her own bosom and among clever men and sharp women, she was externally Protestant for the crowd.

This mode of interpreting religion is pleasant; one enjoys all the privileges that belong to the Established Episcopal Church, and, later, one dies, like Grotius, in the odor of Catholicism, and one has the glory of having a mass said over him by Père Petau.

Plump and in good health as Josiane was, let us insist here, she was an accomplished romanticist.

At times, her sleepy and voluptuous way of drawling her words resembled the stretching out of the paws of a tigress prowling in the jungle.

The advantage of being a prude is that it disturbs the classification of the human race. One no longer does it the honor to belong to it.

Above all, to put the human race at a distance, this is what is of moment.

When one has not Olympus, one takes the Hôtel Rambouillet.

Juno resolves herself into Araminta. An assumption of divinity, that is not recognized, makes a woman pointed at. In default of thunderbolts, one has impertinence. The temple shrivels into a boudoir. Not being able to be a goddess, one is an idol.

There is, moreover, in the male romanticist a certain pedantry that pleases women.

The coquette and the pedant are neighbors. The union of the two is seen in the coxcomb.

The subtle is derived from the sensual. Gluttony affects delicacy; a grimace of aversion is becoming to covetousness.

And the weak side of woman is conscious of being guarded by all that casuistry of gallantry, which takes the place of scruples, with prudes. It is a line of circumvallation with a moat. Every prude has an air of reluctance. This protects her.

She will consent, but meanwhile she treats it lightly.

Josiane had an unquiet conscience. She felt such a proclivity to immodesty, that she was a scold. The fierce recoil backward of our vices carries us into opposite vices. The excessive effort to be modest makes the prude. To be too much on the defensive, this betrays a secret desire to be attacked. The blustering are not severe.

She intrenched herself within the arrogant exclusiveness of her rank and birth, all the while meditating, perhaps, as we have said, some abrupt sallying forth.

It was at the dawn of the eighteenth century. England exhibited in the rough draft what France was under the Regency. Walpole and Dubois were in power, Marlborough was fighting against his ex-king James II., to whom he had sold his sister, Churchill. Bolingbroke then shone, and Richelieu was beginning to sparkle. Gallantry found its convenience in a certain commingling of castes; social equality established itself by vice. It came later to establish itself by ideas. The breaking down of rank, an aristocratic prelude, began what the Revolution came to finish. They were not far from Jélyotte, openly seated in broad day on the bed of the Marquis d'Épinay. It is true, for the manners of the age echo it, that the sixteenth century had seen the nightcap of Smeton over the pillow of Anne Boleyn.

If woman signifies indiscretion, as I know not what council has affirmed, never was woman more entirely woman than at this time. Never, covering her frailty with her charms, and

her weakness with her omnipotence, had she more imperiously given herself absolution. To make the forbidden fruit the permitted fruit, this was Eve's fall; but to make the permitted fruit the forbidden fruit, this was her triumph. She finished with this. In the eighteenth century woman drew the bolt upon her husband. She shut herself up in Eden with Satan. Adam was outside.

All Josiane's instincts inclined her rather to yield herself in gallantry, than in the legal way. To yield ourselves up to gallantry gives a literary tone, recalls Menalcaas and Amarylhis, and is almost a learned act.

Mademoiselle de Scudéry, apart from the affinity that ugliness has for ugliness, had no other motive for yielding to Pelisson.

The young girl a sovereign, and the wife a subject, these are the old customs of England. Josiane postponed, as long as she could, the hour of this subjection. Let it come at last to marriage with Lord David, since the royal good pleasure demanded it, it was a necessity doubtless, but what a misfortune! Josiane accepted and refused Lord David. There was between them a tacit understanding, not to conclude and not to break off. They kept out of each other's way. This fashion of carrying on a love-matter, with one step forward and two steps backward, is expressed in the dances of the time, the minuet and the gavotte. To be married folks, this did not improve the expression of the countenance, this faded the ribbons one wore, this made one grow old. The wedding, mournful eclipse of brilliancy! The handing over of a wife by a notary, what stupidity! The brutality of marriage creates definite situations, suppresses the will, murders the choice, has a syntax like a grammar, substitutes orthography for inspiration, makes love a mere formula, dispels all the mysteries of life, dissipates the illusions of feminine attire, confers rights belittling to him who exercises them as to her who submits, deranges, by throwing the scale all on one side, the charming equilibrium of the robust sex and the all-prevailing sex, of force and beauty, and makes here a master and there a servant, whilst, but for marriage, there had been a slave and a queen. To make the bed so prosaic as to be decent, could there be conceived any thing more gross? That there should be no longer the least harm in loving each other, is not this sufficiently stupid?

Lord David matured. Forty years—it is the striking of an hour. He had not heard it, and, in fact, he had always the air of thirty. He found it more amusing to desire Josiane, than to possess her. He possessed her in others; he had women. Josiane, for her part, had dreams.

Her dreams were the worse.

The Duchess Josiane had this peculiarity, less rare than would be supposed, that one of her eyes was blue and the other black. Her looks were made up of love and hate, of gayety and dejection. Day and night were mingled in her glance.

Her ambition was this, to show herself capable of the impossible.

One day she had said to Swift—

—You imagine, you fellows, that you know what scorn is.

"You fellows" meant the human race.

She was a papist skin-deep. Her Catholicism did not exceed the quantity essential to fashion. It would have been Puseyism to-day. She wore the heaviest robes of velvet, or satin, or watered silk, some of fifteen or sixteen ells' breadth, and fastenings of gold and silver, and around her girdle in profusion knots of pearls alternated with knots of brilliants. She was extravagant in lace. She wore sometimes a bachelor's braided waistcoat. She rode on a man's saddle, notwithstanding the invention of side-saddles introduced into England in the fourteenth century by Anne, wife of Richard II. She washed her face, her arms, her shoulders, and her neck, in sugar-candy beaten up with the white of an egg, after the Castilian style. She had, after any witty saying uttered in her presence, an appreciative laugh of rare grace. Beyond this, no harm in her. Rather good, than otherwise.

## THE WOMAN OF BUSINESS.

BY THE AUTHOR OF "THE BACHELOR OF THE ALBANY."

CHAPTER V.—IN WHICH PLANS ARE DERANGED.

MR. EVELYN had sat too long in the evening air, and he was coughing when he joined his daughter the next day at breakfast. However, the cough got easier after he had eaten something, and then he asked her what she thought of their company of the day before.

"Oh, Mr. Woodville did so amuse me," she answered, "with his oddities, and his globules, and his endless wraps, and the extraordinary old things he had under them, which he thought I did not see; and all the queer organs he seems to have—a great many more, papa, than you have got, although you are pretty well off, too. What a droll place his studio must be, or his surgery! I presume its something between the two. At the same time, I don't deny that he is clever and agreeable, and, though I laugh at him, I like him."

"And what do you say of the lawyer?"

"Well, papa, he is very inferior to his friend in point of organs; there is nothing to laugh at about him at all; no nonsense of any kind; he is no adventurer, I am sure, but, if he was, he would push his way in the world, wouldn't he?"

"A sort of Quentin Durward in a wig; I think you measure them both very correctly. They are both clever young men in their several ways, and much to be liked."

"Certainly, sir; but I must now tell you what I don't like."

"What's that, Fatima?"

"Well, then, I don't like your going on as you do sometimes—as you did last night, for instance—diverting people, and especially strangers, with my book-keeping and arithmetic. You don't intend it, but you put it in a ludicrous way which doesn't make me feel proud of myself, I assure you. If I had not stopped you in time, you would have told those strange gentlemen of my little speculations and dabbling in the funds."

"No, Fatima, I should never have told them a word about that."

"I am not at all sure of it, and even that I once burnt my fingers. All true, no doubt; but people would only see the ridiculous side of it."

The good, vain father was very sorry for what he had done, and promised to be better behaved in future.

"After all," she said, "what signifies it? They did not laugh at me; and if they did?—I am thinking of myself when I ought to be only thinking of you and the cold you have caught. What is to be done if you are laid up? Oh, how I wish there was somebody to do your business at Turin for you!"

"There is no use in talking of that, my love."

"I suppose not; so you must only take great care of yourself."

Meanwhile the two young men were at breakfast, talking of the Evelyns, as the Evelyns had been talking of them, and laughing over the little incidents of the day before.

"A very determined young lady," said Woodville. "She makes everybody do just what she likes. She imposed the labors of a galley-slave on you without the least ceremony. And how soon she put a spoke in the old gentleman's wheel when he began to be too communicative!"

"What a prodigious talker he is; all 'tongue, with a garnish of brains.' I never could see the propriety of that expression applied to Burke, whose brains were surely not inferior to his tongue, as I suspect Mr. Evelyn's are."

"He would prove a bore on longer acquaintance, I am satisfied. We proceed to-morrow, eh? There is nothing more to be done here?"

"By all means. I hope the old gentleman has suffered from the night air as little as I have."

"We ought to call on them in the course of the morning and in quire," said the other.

"It would be the right thing, I suppose," said the artist.

Alexander wrote letters, and Woodville sketched for an hour or two, and then they went to pay their visit. Mr. Evelyn was coughing as they entered his apartment. Things were disposed pretty much as they had been the previous day, only that Mr. Evelyn had the bundle of papers lying before him, and he appeared to be wading through them. Miss Evelyn was reading.

The old gentleman pushed away the papers with the alacrity of a man engaged in some intricate matter not at all to his taste, and which he willingly takes advantage of any excuse to throw aside.

Alexander said he feared they had dropped in at an inopportune moment.

"Not at all," said Mr. Evelyn, "we are only too glad to be so agreeably interrupted."

"I am afraid, sir," said Woodville, "you sat too long *à la belle étoile* last evening."

"Indeed, he did," said his daughter, "and I was to blame in allowing it, particularly with his engagements. When once he takes cold, he is in no hurry to get rid of it."

"Oh, yes, my dear," said Mr. Evelyn, "I shall get rid of it in time, depend upon it."

"*Nous verrons*," said the lady, dryly, as if she was still of her own opinion, and then, addressing Alexander, she added—

"You visit Turin, I presume, before you leave the north of Italy?"

"It was not in our programme," he replied.

"Oh, you ought surely to see Turin—ought they not, papa?"

"It is worth a visit certainly," said Mr. Evelyn, "if you have time to spare—and, by-the-by, you would be within easy reach of the Vaudois country, and a few days there would be well spent."

"Indeed they would," said Miss Evelyn, with emphasis, "both for its natural attractions and its historical interest. What the dear little Orta wants is a tale of heroism interwoven with its beauties. You really ought not to leave Italy without seeing our valleys."

"But you must know," said Woodville, smiling, "that my friend here is a great stickler for his plans; when he has made his programme, he insists on abiding by it. It is a point of conscience with him."

"Is your conscience so very punctilious?" said Miss Evelyn, addressing the young man of the law, with her peculiar look through her half-closed eyelids, the expression of which it was so hard to define.

"Well, Mr. Woodville colors highly," he replied. "I am for adhering to resolutions, but not, I hope, pedantically."

"Just so," said the young lady. "Papa, what was it the Duke of Wellington said of his plans in the Peninsular War? I remember he thought it so wise."

"Something to this effect," said the old gentleman, "that the best plans were those which were rather elastic and admitted of being most easily modified according to circumstances."

"Yes, and it was that which gave his plans the advantage over those of French generals."

"You see, she has great examples to enforce her arguments," said the proud father.

"Great indeed," said Alexander; "so, as I see no reason why we should not go to Turin, and the Valleys, except that we did not originally propose it, I leave it to my friend to decide whether we shall be rigid, like Marshal Soult, or elastic, like the Duke of Wellington."

"Leave it to me!" exclaimed Woodville; "why I have been the advocate for elasticity ever since we set out on our travels; and I think, I may add, the martyr of the opposite system sometimes."

"*Teste Montrone and the donkey*," said Mr. Evelyn, laughing.

"I do owe him some amends," said Alexander.

"You will find the inns rude," said Miss Evelyn, assuming the change of plans to be a settled thing, "but the pastors are hospitable to strangers, and we will give you letters to our friends."

Mr. Evelyn began to cough again, so the young men thought it was time to take leave.

"I hope we shall see you once more before you go," said the lady, very graciously, as they withdrew. "Perhaps you will drop in to tea?"

They were no sooner out of the room, than the artist struck the palm of his left hand with his right, and exclaimed—

"She has a design in sending us off to those Valleys, as sure as my name is Woodville."

Alexander laughed heartily.

"How she settled it all! if they did not settle it between them. Did I not tell you she was the girl to make everybody do her pleasure—even you, who I thought was as firm as a rock. She has her objects: remember my words."

"Nonsense, my dear fellow; what objects could she possibly have?"

"Why really, Alexander, you are sometimes as blind as a bat—don't you see? She knows her father will not be able to travel, or she is determined not to allow him; he will not go to Turin, so you must."

"But why, my sharp-sighted friend, why?"

"To do his business for him, whatever it is."

Alexander laughed till he was obliged to hold his sides.

But Woodville was not much out in his conjecture. If the shrewd young lady had not suggested and urged the departure from their plans on the tourists with the distinct purpose of which Woodville suspected her, she was certainly not long without perceiving how it might be turned to her father's advantage.

He returned, still coughing, to his papers, and coughed and sighed and groaned over them. It was pitiable to see Mr. Evelyn at those papers. He turned them over and over, now read a portion of one, then dropped it as if in despair, then took it up again, and made a mark with a pencil, then tried another; then tied them in a certain order, then untied them, and changed the arrangement, coughing and groaning, and groaning and coughing. It was pitiable. At last the coughing became a fit; he gave a deeper groan than ever, and then his daughter ran over to him, gathered the papers all up, tied them together doggedly, as if she was resolved they should never get loose, and vowed he should not open or look at them again until he was well.

"Very well, my love; I acquiesce," he said, as the cough ceased, leaving his voice so feeble that it was scarcely audible.

When he got a little better, his daughter sat down beside him, and said:

"Now, papa, listen to me. I have got an idea. Mr. Alexander has decided to go to Turin; he is a lawyer, or has been educated for one; he is very obliging, you see, and I am positive he is just the man who may be depended upon to do any thing he undertakes. Now why not ask him to act for you, and put all those plaguy papers into his hands?"

Mr. Evelyn shuffled in his chair, took his spectacles from his nose, and stared at her.

"Why, Fatima, I never heard any thing so monstrous in my life. Here is a young man on a vacation tour, relaxing himself, no doubt, after hard work, and perhaps preparing for harder, and you want me to saddle him with a troublesome piece of business like this—he would have a pleasant time of it with those papers to study. Besides, my dear, they would actually suspect us, and with very good reason, of persuading them to change their plans for our own selfish purposes."

"Pooh, pooh, as to their plans," said Miss Evelyn, curtly, looking vexed at her father's opposition. "There is nothing in that. What other plan had they but the old stupid, cockney dog-trot tour of the lakes? They ought to be greatly obliged to us for giving them something better to do."

"Fatima, the thing is not to be thought of; say no more about it."

"Very well, sir, so be it; but positively you shall not make yourself ill with business, whatever comes of it. What would you think of going to bed? I think it would be the best thing you could do."

"I will," said Mr. Evelyn.

Toward evening, just as the hour of tea arrived, Alexander received a little note from Miss Evelyn, a note with three corners to it, in every one of which Woodville, as he eyed it, saw craft and diplomacy. She was unable to receive him and his friend; her father's cold was worse, he was a little feverish, and keeping his room; in the morning she promised the letters to the Valleys, and hoped to bid them good-by before they went. The note was only remarkable for being couched in the fewest possible words, and written in a bold, yet not unfeminine hand, as legible as printing, the letters were so distinctly formed.

There was nothing very deep or crooked in it, at all events. Yet troubles were near at hand, and poor little Woodville dreamed that the blow was to fall on him first.

He was at his toilet the next morning, when somebody came tapping at his door. When he opened it, behold it was Hannah, to say her mistress would be greatly obliged to him if he would allow her to see him for a few moments.

"Of course," replied the artist, in a flutter, "with much pleasure, as soon as I am dressed."

What could she possibly have to say to him? Why did she not apply to Alexander if she was in any difficulty? It was only when Hannah was going away that he thought of asking how the old gentleman was.

"I am afraid he is seriously ill, sir."

"Has a doctor been sent for?"

"I think, sir, my mistress wishes to consult *son* first."

If Woodville was flurried before, he was twice as flurried now. He cut short some of his operations, shuffled off his old dressing-gown, huddled on the first decent clothes that came to his hand, and obeyed the lady's summons with as much composure as he could muster.

He found her sitting coolly at her breakfast. While she agitated others, she was composed enough herself. It never occurred to him that the most loving and devoted of daughters must have her breakfast, even with the author of her being in bed with a cold. He thought her a monster—but he was not very long under that impression.

When she rose to receive him, which she did with warmth, thanking him cordially for coming to her, he observed that her face was pale, her eyes solicitous, and he inferred from her *deshabillé*, and the hasty arrangement of her hair, that the monster of the moment before had probably been sitting up during the night with her father.

"I hope you will excuse me, Mr. Woodville," she said, fixing her earnest eyes on her visitor, "but I am in a very great difficulty. It is most unfortunate that my father should be taken ill in this out-of-the-way place."

"I am very much concerned indeed—very sorry," said Woodville, his trepidation for himself rapidly giving way to interest in the lady; "but surely the place is important enough to have a physician."

"No doubt it has; but, you must know, that both my father and I have the greatest horror of the Italian doctors; they always bleed."

"They certainly do," murmured Woodville, his uneasiness reviving, but unable to dispute the fact.

"And my father is not a subject for bleeding, sir—should you say that he was?"

"I certainly should not," said Woodville, conscientiously forced to acquiesce in premise after premise, though dreading the conclusion to be drawn from them; "but why should you allow the doctor to bleed?"

To that she had a ready answer.

"We know something of the doctor here, Mr. Woodville, and he can do nothing but bleed; if there is a Sangrado in Italy, he is one; so, under these circumstances, it occurred to my father, or to me—I hardly know which of us thought of it first"—"I have no doubt you did," thought Woodville—"that as you are not very strong yourself, and have probably a few simple medicines with you, you might have something that would give him temporary relief, and give us time to send to Milan for a doctor whom we know there."

This was letting him off very easily indeed. With this weight taken off his mind, Woodville brightened up so suddenly, that the lady very naturally thought he was flattered by her application; he placed all his treasury of remedies heartily at her disposal, mentioned one or two things which might possibly be of use, and was hastening to his room for them, when Miss Evelyn, thanking him with great feeling, made a rapid little supplementary request, in the form a suggestion, that perhaps he would be kind enough to see her father. He consented, for he was no longer on the defensive, and it was only as he unlocked his medicine-chest, that he felt himself already playing the part of "*le médecin malgré lui*."

He saw Mr. Evelyn, felt his pulse, and, finding it very low, returned to his daughter with so long a face that he alarmed her very unnecessarily. He tried to undo the effect by repeated assurances that there was no manner of danger, but she placed much less faith in what he said than in the signs of uncertainty and agitation which his countenance exhibited.

"You go to-day," she said, anxiously—"you *must* go to-day?"

It was easy to embarrass poor Woodville, but nothing embarrassed

him so much as a question put to him point-blank as to his intentions in a given set of circumstances.

"Well," he replied, "if I thought—really—I hardly know what to say."

That was just the truth; he did not know what to say, and what he did say further on that occasion he could never distinctly remember; only it ended in his promising to stay until the arrival of the doctor. Whether the offer originated with himself, or was suggested by Miss Evelyn, he was never perfectly certain, but that was a point of no consequence. He promised to remain, and Miss Evelyn's gratitude knew no bounds.

"It is so kind, so very kind," she said; "and my father will be so obliged. I must let him know at once how kind you are."

And she ran to her father's room.

Woodville ran to look for Alexander, who had been out for a long walk, and was now vigorously eating his breakfast, wondering what had become of his friend.

Woodville rushed in, dashing his hands through his hair, and as pale as if he had just seen a spectre. He flung himself down on a sofa.

"What on earth is the matter, my dear fellow?"

"Every thing's the matter—I'm in for it—that's all. If you go to-day, you must go alone—at all events, I must stay—there's no help for it."

"But why? you don't tell me why."

"Because the old gentleman has taken it into his head to be ill, and he won't see the doctors of the place, and Miss Evelyn saw me taking that confounded globule in the boat, and thinks I am a doctor in disguise, or at least an apothecary. She began by asking me for something to relieve him, then she asked me to see him, and then—I really don't well know how the rest of it came about, but here I am planted, Heaven knows for how long, until some physician or another arrives from Naples or Milan, or God knows where."

"Is he dangerously ill?"

"No, not dangerously—but I would give just a thousand guineas to be back again in my quiet attic."

"Calm yourself, old fellow, and try to eat your breakfast. Every thing will come right if you only take things quietly."

"What will you do?"

"Exactly what I intended to do, when I got up this morning. I have ordered a *calèche* and packed my portmanteau. Miss Evelyn does not want me."

"Not here?"

"Nor anywhere else. At all events, I will be before her, and volunteer whatever services I can render. What else can I do?"

"You are a bold fellow."

"Well, do you eat your breakfast while I go and take leave of this terrible young lady, and know the worst."

Woodville was now getting calm, and beginning to sip his coffee. As Alexander was leaving the room, he called him back.

"Though I abuse her," he said, "she interests me in spite of myself. Say all you can to encourage her: tell her from me that there is no danger whatever in her father's situation; there will be ample time to get the best advice; and impress upon her also, my dear fellow, that it is only on condition of not being held at all responsible that I consent to stay."

"Yes, yes—I shall explain every thing as well as you could yourself."

"Much better, I hope," said the artist.

## A SKETCH OF THE STREET-GAMIN OF NEW YORK.

THAT glorious Frenchman, Victor Hugo, has immortalized the *gamin* of Paris; but as curious specimens of little humanity may be found in our own metropolis among those classed as "the out-door poor." There seems to be something amphibious in the nature of these children, as they hop about the docks, not exactly in the water, and not quite out of it. A moderate rain is no disturbance, and a hard one only causes a brief eclipse. When it is over, they are out of their mysterious hiding-places, as brisk as ever, and, seemingly, as dry. Their delight is to watch the flight of pigeons, and, when one white or black or mottled bird touches another, they look upon it as

a celestial game of "tag." The gold-dealers on Wall Street are not half so earnest in following or calling the erratic motions of their god, as are the children at the foot of the same street, in looking with bated breath as some pigeon nears another, and then, at the touch of the wing and the dart into space, a dozen will shout, "He's it! he's it! The white one is the tag!"

These little things—innocent from ignorance, and not old enough for perfect iniquity—are generally partly clothed and partly fed from some of the institutions of charity. The children consider that they render value received for what they get, by attending some form of Sunday-school or divine service. The surest way to trap them is to distribute food or clothing on the Sabbath. Consequently, they all have dim ideas of Providence. Only the other day, the writer passed a little German boy of some six years, who had the *clean* streaks running down his cheeks that told of recent punishment and more recent tears. Poor little things—rain and tears are the only washings their faces often know! He was gravely explaining the matter to a sympathetic little girl, and closed with, "I likes God better nor my fadder." In the adjacent alley, another boy had discovered a free show, and was dancing with delight as he shouted, "Run here quick, everybody! Run quick, or you won't see it!" It was a woman whipping a child.

Four of these children—John and Pete Maginnis, and Willie and Susan Roberts—were among the "outside" children of a city mission; that is, they had a shelter which saved them from Randall's Island, and some theoretical relatives who would not permit the House of Industry to take control, and get them homes in the West.

John and Pete had fallen in love with the great card of pocket-knives, tweezers, and corkscrews, that hung in the window of a hardware store on Broadway, not far from the City-Hall Park. To save enough pennies for a purchase would have involved starvation; and yet the boys' longing for a bright pocket-knife was none the less ardent. The incongruity of pearl handles and polished steel in the pockets of the rolled-up and dirty men's trousers they wore, did not strike them, and by a unanimous vote John and Pete resolved themselves into a committee of two on ways and means. What they wanted was in the custody of their natural enemy and prey, a "Broadway dress-up," and guarded by those watch-dogs in blue, the police. To smash the thick plate of glass with a paving-stone or a lump of coal, was out of the question. Equally impossible to get inside unseen, for they tried it.

A new building was going up on the lot next to the store, and the ladders used by the hod-carriers during the week stood unused on Sunday. The roof-timbers of the new building reached as high as the roof of the store. With that generosity we all feel in the property of others, the two discoverers offered Willie an equal share in the speculation.

He was willing enough, but his little sister, Sue, was his confidante.

She was consulted, and her objections were very decided. Yet, to all her arguments and childish logic, the two older tempters had equally ready replies. She knew of the text, "Thou, God, seest me;" but they said they would go at night, when He couldn't see, and there was no gas on the top of the store. She was not informed enough to meet that difficulty. To her argument that the penknives did not belong to them came the answer, "What do they put them in the outside winder for, then?" When she insisted that the ladies at the Mission would be offended, and their anger would close the avenue to shoes and bread, the little rogues said, "They won't know it." She urged the danger, and they replied, "If it ain't safe, we kin come down agin." To her climax, the terror of the police, they responded that "perlecemens don't leave they beat to go into new buildings," and that she was the very one to stay below and watch. She could have some flowers to sell, and would not be taken up.

This was conclusive to Willie, and, perforce, was so to his devoted little sister.

Sunday night came, starlight but dark, and, by the time the crowd, which is always thin on Sunday, was reduced by the lateness of the hour, the four adventurers had found out the locality of the night-watch, on the front and back streets, and were safe in the shadow of the basement brickwork. That once achieved, they concluded to take the flower-girl with them, and all four began the ascent of the steep and perilous ladders. This was bad enough in daylight, but worse in the dark, amid the pitfalls of loose lumber and scattered masonry.

At last they were all safe on the top of the building, only to meet a new difficulty. There was a trap-door, as they had supposed, but so securely fastened as to defy all efforts to raise it. The flat tin of the roof was not more impervious.

The building, however, ran through from street to street, and, as the central part would be almost dark, if only dependent for light from the street windows, there was the usual remedy. An opening like a great well led from the roof to the basement, and light went down and rain was kept out by a skylight of large panes of glass. Other and thicker glass intervened between the first and second floors and the basement; but that was three stories below.

To break and remove a pane of the glass of the skylight, and make an opening large enough for a small boy, was easily and quickly done. But that only made a hole over a dark gulf of unknown depth.

Probably, if there is any thing which a New-York street-boy is afraid of, that something is not yet discovered; and so they were not afraid of the chasm beneath them. They knew that the most of stores only protected such holes by a railing, breast-high from the floor, and they took this for an average store.

John was the oldest and strongest, a boy of about twelve years. He let himself down by the hands, and hung suspended. Then he gave his body a swinging motion as a preparation for the leap, and, without a thought how to get back, he let go. With a slight jar he safely cleared the opening, and landed on his feet on the floor beyond. Pete next made the attempt, and was equally successful. As Susan's dress did not suit for such a feat, she was not to try it. Her brother came next, and again she begged him to give it up and go home; but his pride and boyish reputation were at stake, and he let himself down for the swing. Then came the leap—he struck the railing, and there was a heavy fall, far below. The sister was with some difficulty persuaded not to follow him in the same way, and then the two who were safe hurried down to see if the other was dead.

The back part of the store, opening on the back street, was used for a clothing-store, and a pile of coats on the glass of the second floor had broken the fall and saved life. As it was, a leg was broken, and he was bruised all over. The larger boy took him on his back, and slowly and painfully bore him up the stairs, often pausing to rest. The other one succeeded in unbolting the trap-door from the inside, and then the little sufferer was laid at his sister's feet on the high roof. It would not do to lose the fruits of the expedition on account of the accident, and away the two boys scampered below for the coveted pen-knives. An abundance of these were found without venturing to the window, and, with pockets distended with treasure, they sought and found access to the clothing-store in the rear.

The department for boys suited them exactly, and the soiled rags of the docks were soon exchanged for cloth and velvet, with the full glory of buttons. Some things were still lacking. The shoes had been left at home, as likely to be in the way; and there were none to be had. There were no hats or caps, and they kept the old ones. They did not wash their faces. Then the pockets stuck out alarmingly.

They were in no hurry, and spent more than an hour at their investigation. Susan was in a hurry, for Willie had fainted from pain, and might die, for all she knew. It must ever be an unexplained mystery, how terror or excitement can lend unnatural strength, and give a child the endurance of a man. She did not pause to question of possibility, but began the task of carrying a boy, almost as large and heavy as herself, down the ladders that were so difficult alone and unencumbered. How she succeeded, often requiring one hand for a guide, while she held him with the other, avoiding the pitfalls, walking on the open timber, saving him from hurt as much as possible, and not saving herself at all—this she could not have explained to herself or to others. Yet, by the time the two others had finished their robbery and were at the top of the ladders, she was at the bottom, and resting, sick and half-conscious, beside her insensible brother. As they came down and called her, she was not able to answer, and they passed on. A policeman was on the sidewalk as they emerged and undertook to pass him with the air of well-bred city boys. Probably it was overdone. Then the glossy clothes and full array of buttons did not exactly correspond with the bare feet, old hats, and dirty faces. There was a brief chase, and then both were marched off under arrest. The result of all the labor and peril was hard labor in the shoe factory of the House of Refuge, up the river.

Susan knew from the noise what had happened, and the absence

of the policeman was her chance. Again her arms enfolded her brother, and soon she was across the street and into the narrower one which led to her home. The boy became conscious, and began to groan; but a whisper of the danger hushed that, and she toiled on, avoiding the lamp-light when she could, resting often from necessity, and fancying the flat cap and long coat of the police in every shadow. Of all things, she feared most these representatives of the law. A greater fear in that it was vague and not defined or limited. At last, one did come up the street; but she cowered in the shadow of a door-step, and he passed her in the darkness. Another was at a corner, and they had to wait many long minutes before he went away. No part of the stolen property was with them, and she was glad of that. Still she avoided arrest. Prison or hospital—it was all one to them. The street was liberty, and beggars were free.

At last came the darkness and filth and smell of the alley-way—worse than the hospital or prison to others, but home and safety to them. The mother was sober, and there were a bed and a doctor before daylight.

Susie was not afraid of the ladies of the Mission, and the next morning early she had told them the whole story. No one doubted it; and if they had, the bruised and half-dead boy, and the report of the robbery in the morning papers of the next day, was proof enough.

The little sister was sore and exhausted, so as scarcely to be able to walk, but insisted on being the nurse. As there was little prospect of income from the boy for many months to come, and as his condition and the act which led to it was a lesson on the perils of the streets, the mother was persuaded to let both children be sheltered from the out-door temptations within the walls of the Mission.

Poor Willie had a hard time of it, as some of his injuries were internal; but his soul and his body were nursed at the same time, and knowledge of sin with repentance grew with his returning strength. It is hard for those who know Bible truths so well, to understand how utterly ignorant children can be, who hear Sabbath bells and see open churches from birth. It was hard for Willie to understand why little Susan could not go out and steal an apple from the nearest stand for him, while he was sick; and harder still for pious people to understand that he knew no better. He certainly knew that stealing was punished, but failure of success in begging had also been, and he knew of as little reason for one as for the other. The two other boys, who were arrested, had to guess at morals from the tender mercies of the State House of Correction; but the little boy who was saved by his sister, and the sister who saved him, have comfortable homes amid the green prairies of the West.

Both would blush to-day, did any one there know that they had once been little burglars.

## HUNTING THE ORANG-UTAN IN BORNEO.

ONE of my chief objects in coming to stay at Simunjon was to see the orang-utan (or great man-like ape of Borneo) in his native haunts, to study his habits, and obtain good specimens of the different varieties and species of both sexes, and of the adult and young animals. In all these objects I succeeded beyond my expectations, and will now give some account of my experience in hunting the orang-utan, or "mias," as it is called by the natives; and as this name is short, and easily pronounced, I shall generally use it in preference to *Simia satyrua*, or orang-utan.

Just a week after my arrival at the mines, I first saw a mias. I was out collecting insects, not more than a quarter of a mile from the house, when I heard a rustling in a tree near, and, looking up, saw a large red-haired animal moving slowly along, hanging from the branches by its arms. It passed on from tree to tree till it was lost in the jungle, which was so swampy that I could not follow it. This mode of progression was, however very unusual, and is more characteristic of the hylobates than of the orang. I suppose there was some individual peculiarity in this animal, or the nature of the trees just in this place rendered it the most easy mode of progression.

About a fortnight afterward I heard that one was feeding in a tree in the swamp just below the house, and, taking my gun, was fortunate enough to find it in the same place. As soon as I approached, it tried to conceal itself among the foliage; but I got a shot at it, and the second barrel caused it to fall down almost dead, the two balls having entered the body. This was a male, about half-grown, being scarcely

three feet high. On April 26th, I was out shooting with two Dyaks, when we found another about the same size. It fell at the first shot, but did not seem much hurt, and immediately climbed up the nearest tree, when I fired, and it again fell, with a broken arm and a wound in the body. The two Dyaks now ran up to it, and each seized hold of a hand, telling me to cut a pole, and they would secure it. But although one arm was broken and it was only a half-grown animal, it was too strong for these young savages, drawing them up toward its mouth notwithstanding all their efforts, so that they were again obliged to let go, or they would have been seriously bitten. It now began climbing up the tree again; and, to avoid trouble, I shot it through the heart.

Only four days afterward some Dyaks saw another mias near the same place, and came to tell me. We found it to be a rather large one, very high up on a tall tree. At the second shot it fell rolling over, but almost immediately got up again and began to climb. At a third shot it fell dead. This was also a full-grown female, and, while preparing to carry it home, we found a young one face downward in the bog. This little creature was only about a foot long, and had evidently been hanging to its mother when she first fell. Luckily it did not appear to have been wounded, and after we had cleaned the mud out of its mouth it began to cry out, and seemed quite strong and active. While carrying it home it got its hands in my beard, and grasped so tightly that I had great difficulty in getting free, for the fingers are habitually bent inward at the last joint so as to form complete hooks. At this time it had not a single tooth, but a few days afterward it cut its two lower front teeth. Unfortunately, I had no milk to give it, as neither Malays, Chinese, nor Dyaks ever use the article, and I in vain inquired for any female animal that could suckle my little infant. I was therefore obliged to give it rice-water from a bottle with a quill in the cork, which after a few trials it learned to suck very well. This was very meagre diet, and the little creature did not thrive well on it, although I added sugar and cocoa-nut milk occasionally, to make it more nourishing. When I put my finger in its mouth it sucked with great vigor, drawing in its cheeks with all its might in the vain effort to extract some milk, and only after persevering a long time would it give up in disgust, and set up a scream very like that of a baby in similar circumstances.

When handled or nursed, it was very quiet and contented, but when laid down by itself would invariably cry; and for the first few nights was very restless and noisy. I fitted up a little box for a cradle, with a soft mat for it to lie upon, which was changed and washed every day; and I soon found it necessary to wash the little mias as well. After I had done so a few times, it came to like the operation, and as soon as it was dirty would begin crying, and not leave off till I

took it out and carried it to the spout, when it immediately became quiet, although it would wince a little at the first rush of the cold water and make ridiculously wry faces while the stream was running over its head. It enjoyed the wiping and rubbing dry amazingly, and when I brushed its hair seemed to be perfectly happy, lying quite still with its arms and legs stretched out while I thoroughly brushed the long hair of its back and arms. For the first few days it clung desperately with all four hands to whatever it could lay hold of, and I had to be careful to keep my beard out of its way, as its fingers clutched hold of hair more tenaciously than any thing else, and it was impossible to free myself without assistance. When restless, it would struggle about with its hands up in the air trying to find something to take hold of, and, when it had got a bit of stick or rag in two or three of

its hands, seemed quite happy. For want of something else, it would often seize its own feet, and after a time it would constantly cross its arms and grasp with each hand the long hair that grew just below the opposite shoulder.

After five weeks it cut its two upper front teeth, but in all this time it had not grown the least bit, remaining both in size and weight the same as when I first procured it. This was no doubt owing to the want of milk or other equally nourishing food. Rice-water, rice, and biscuits were but a poor substitute, and the expressed milk of the cocoa-nut which I sometimes gave it did not quite agree with its stomach. To this I imputed an attack of diarrhoea from which the poor little creature suffered greatly, but a small dose of castor-oil operated well, and cured it. A week or two afterward it was again taken ill, and this time more seriously. The symptoms were exactly those of intermittent fever, accompanied by watery swellings on the feet and head. It lost all appetite for its food, and, after lingering for a week a most pitiable object, died, after being in my possession nearly three months. Exactly a week after I had caught this interesting little animal I succeeded in shooting a full-grown male orang-utan. I had just come

Orang-Utan attacked by Dyaks.

home from an entomologizing excursion when Charles \* rushed in out of breath with running and excitement, and exclaimed, interrupted by gasps, "Get the gun, sir—be quick—such a large mias!" "Where is it?" I asked, taking hold of my gun as I spoke, which happened luckily to have one barrel loaded with ball. "Close by, sir—on the path to the mines—he can't get away." Two Dyaks chanced to be in the house at the time, so I called them to accompany me, and started off, telling Charley to bring all the ammunition after me as soon as possible. The path from our clearing to the mines led along the side of the hill a little way up its slope, and parallel with it at the foot a wide opening had been made for a road, in which several Chinamen were working,

\* Charles Allen, an English lad of sixteen, accompanied me as an assistant.

so that the animal could not escape into the swampy forest below without descending to cross the road or ascending to get round the clearings. We walked cautiously along, not making the least noise, and listening attentively for any sound which might betray the presence of the mias, stopping at intervals to gaze upward. Charley soon joined us at the place where he had seen the creature, and, having taken the ammunition and put a bullet in the other barrel, we dispersed a little, feeling sure that it must be somewhere near, as it had probably descended the hill, and would not be likely to return again. After a short time I heard a very slight rustling sound overhead, but on gazing up could see nothing. I moved about in every direction to get a full view into every part of the tree under which I had been standing, when I again heard the same noise, but louder, and saw the leaves shaking as if caused by the motion of some heavy animal which moved off to an adjoining tree. I immediately shouted for all of them to come up and try and get a view, so as to allow me to have a shot. This was not an easy matter, as the mias had a knack of selecting places with dense foliage beneath. Very soon, however, one of the Dyaks called me and pointed upward, and on looking I saw a great red hairy body, and a huge black face gazing down from a great height, as if wanting to know what was making such a disturbance below. I instantly fired, and he made off at once, so that I could not then tell whether I had hit him.

He now moved very rapidly and very noiselessly, for so large an animal, so I told the Dyaks to follow and keep him in sight while I loaded. The jungle was here full of large angular fragments of rock from the mountain above, and thick with hanging and twisted creepers. Running, climbing, and creeping among these, we came up with the creature on the top of a high tree near the road, where the Chinamen had discovered him, and were shouting their astonishment with open mouth: "Ya Ya, Tuan; orang-utan, Tuan." Seeing that he could not pass here without descending, he turned up again toward the hill, and I got two shots, and following quickly had two more by the time he had again reached the path; but he was always more or less concealed by foliage, and protected by the large branch on which he was walking. Once while loading I had a splendid view of him, moving along a large limb of a tree in a semi-erect posture, and showing him to be an animal of the largest size. At the path, he got on to one of the loftiest trees in the forest, and we could see one leg hanging down uselessly, having been broken by a ball. He now fixed himself in a fork, where he was hidden by thick foliage, and seemed disinclined to move. I was afraid he would remain and die in this position, and as it was nearly evening I could not have got the tree cut down that day. I therefore fired again, and he then moved off, and going up the hill was obliged to get on to some lower trees, on the branches of one of which he fixed himself in such a position that he could not fall, and lay all in a heap, as if dead, or dying.

I now wanted the Dyaks to go up and cut off the branch he was resting on, but they were afraid, saying he was not dead, and would come and attack them. We then shook the adjoining tree, pulled the hanging creepers, and did all we could to disturb him, but without effect, so I thought it best to send for two Chinamen with axes to cut down the tree. While the messenger was gone, however, one of the Dyaks took courage and climbed toward him, but the mias did not wait for him to get near, moving off to another tree, where he got on to a dense mass of branches and creepers, which almost completely hid him from our view. The tree was luckily a small one, so when the axes came we soon had it cut through; but it was so held up by jungle ropes and climbers to adjoining trees that it only fell into a sloping position. The mias did not move, and I began to fear that after all we should not get him, as it was near evening, and half a dozen more trees would have to be cut down before the one he was on would fall. As a last resource we all began pulling at the creepers, which shook the tree very much, and, after a few minutes, when we had almost given up all hopes, down he came with a crash and a thud like the fall of a giant. And he was a giant, his head and body being full as large as a man's. He was of the kind called by the Dyaks "Mias Chappan," or "Mias Pappan," which has the skin of the face broadened out to a ridge or fold at each side. His outstretched arms measured seven feet three inches across, and his height, measuring fairly from the top of the head to the heel, was four feet two inches. The body just below the arms was three feet two inches round, and was quite as long as a man's, the legs being exceedingly short in proportion. On examination we found he had been dreadfully wounded. Both legs were bro-

ken, one hip-joint and the root of the spine completely shattered, and two bullets were found flattened in his neck and jaws! Yet he was still alive when he fell. The two Chinamen carried him home tied to a pole, and I was occupied, the whole of the next day, preparing the skin and boiling the bones to make a perfect skeleton, which are now preserved in the Museum at Derby.

About ten days after this, on June 4th, some Dyaks came to tell us that the day before a mias had nearly killed one of their companions. A few miles down the river there is a Dyak house, and the inhabitants saw a large orang feeding on the young shoots of a palm by the river-side. On being alarmed he retreated toward the jungle which was close by, and a number of the men, armed with spears and choppers, ran out to intercept him. The man who was in front tried to run his spear through the animal's body, but the mias seized it in his hands, and in an instant got hold of the man's arm, which he seized in his mouth, making his teeth meet in the flesh above the elbow, which he tore and lacerated in a dreadful manner. Had not the others been close behind, the man would have been more seriously injured, if not killed, as he was quite powerless; but they soon destroyed the creature with their spears and choppers. The man remained ill for a long time, and never fully recovered the use of his arm.

Three days after I had shot this one and lost it, Charles found three small orangs feeding together. We had a long chase after them, and had a good opportunity of seeing how they make their way from tree to tree, by always choosing those limbs whose branches are intermingled with those of some other tree, and then grasping several of the small twigs together before they venture to swing themselves across. Yet they do this so quickly and certainly, that they make way among the trees at the rate of full five or six miles an hour, as we had continually to run to keep up with them. One of these we shot and killed, but it remained high up in the fork of a tree; and, as young animals are of comparatively little interest, I did not have the tree cut down to get it.

The orang-utan is known to inhabit Sumatra and Borneo, and there is every reason to believe that it is confined to these two great islands, in the former of which, however, it seems to be much more rare. In Borneo it has a wide range, inhabiting many districts on the southwest, southeast, northeast, and northwest coasts, but appears to be chiefly confined to the low and swampy forests.

It is a singular and very interesting sight to watch a mias making his way leisurely through the forest. He walks deliberately along some of the larger branches, in the semi-erect attitude which the great length of his arms and the shortness of his legs cause him naturally to assume; and the disproportion between these limbs is increased by his walking on his knuckles, not on the palm of the hand as we should do. He seems always to choose those branches which intermingle with an adjoining tree, on approaching which he stretches out his long arms, and, seizing the opposing boughs, grasps them together with both hands, seems to try their strength, and then deliberately swings himself across to the next branch, on which he walks along as before. He never jumps or springs, or even appears to hurry himself, and yet manages to get along almost as quickly as a person can run through the forest beneath. The long and powerful arms are of the greatest use to the animal, enabling it to climb easily up the loftiest trees, to seize fruits and young leaves from slender boughs which will not bear its weight, and to gather leaves and branches with which to form its nest. It forms a peculiar nest when wounded, and it uses a similar one to sleep on almost every night. This is placed low down, however, on a small tree not more than from twenty to fifty feet from the ground, probably because it is warmer and less exposed to wind than higher up. Each mias is said to make a fresh one for himself every night; but I should think that is hardly probable, or their remains would be much more abundant; for, though I saw several about the coal-mines, there must have been many orangs about every day, and in a year their deserted nests would become very numerous. The Dyaks say that, when it is very wet, the mias covers himself over with leaves of pandanus, or large ferns, which has perhaps led to the story of his making a hut in the trees.

The orang does not leave his bed till the sun has well risen, and has dried up the dew upon the leaves. He feeds all through the middle of the day, but seldom returns to the same tree two days running. They do not seem much alarmed at man, as they often stared down upon me for several minutes, and then only moved away

slowly to an adjacent tree. After seeing one, I have often had to go half a mile or more to fetch my gun, and in nearly every case have found it on the same tree, or within a hundred yards, when I returned. I never saw two full-grown animals together, but both males and females are sometimes accompanied by half-grown young ones, while, at other times, three or four young ones were seen in company. Their food consists almost exclusively of fruit, with occasionally leaves, buds, and young shoots. They seem to prefer unripe fruits, some of which were very sour, others intensely bitter, particularly the large red, fleshy arillus of one which seemed an especial favorite. In other cases they eat only the small seed of a large fruit, and they almost always waste and destroy more than they eat, so that there is a continual rain of rejected portions below the tree they are feeding on. The durion is an especial favorite, and quantities of this delicious fruit are destroyed wherever it grows surrounded by forest, but they will not cross clearings to get at them. It seems wonderful how the animal can tear open this fruit, the outer covering of which is so thick and tough, and closely covered with strong conical spines. It probably bites off a few of these first, and then, making a small hole, tears open the fruit with its powerful fingers.

The mias rarely descends to the ground, except when, pressed by hunger, it seeks for succulent shoots by the river-side; or, in very dry weather, has to search after water, of which it generally finds sufficient in the hollows of leaves. Once only I saw two half-grown oranges on the ground in a dry hollow at the foot of the Simūnjon hill. They were playing together, standing erect, and grasping each other by the arms. It may be safely stated, however, that the orang never walks erect, unless when using its hands to support itself by branches overhead or when attacked. Representations of its walking with a stick are entirely imaginary.

The Dyaks all declare that the mias is never attacked by any animal in the forest, with two rare exceptions; and the accounts I received of these are so very curious that I give them nearly in the words of my informants, old Dyak chiefs, who had lived all their lives in the places where the animal is most abundant. The first of whom I inquired said: "No animal is strong enough to hurt the mias, and the only creature he ever fights with is the crocodile. When there is no fruit in the jungle, he goes to seek food on the banks of the river, where there are plenty of young shoots that he likes, and fruits that grow close to the water. Then the crocodile sometimes tries to seize him, but the mias gets upon him, and beats him with his hands and feet, and tears him and kills him." He added that he had once seen such a fight, and that he believes that the mias is always the victor.

My next informant was the Orang Kaya, or chief of the Balow Dyaks, on the Simūnjon River. He said: "The mias has no enemies; no animals dare attack it but the crocodile and the python. He always kills the crocodile by main strength, standing upon it, pulling open its jaws, and ripping up its throat. If a python attacks a mias, he seizes it with his hands, and then bites it, and soon kills it. The mias is very strong; there is no animal in the jungle so strong as he."

## RUSSIAN POPULAR LEGENDS.

### SECOND ARTICLE.

THE feeling with which Russian peasants regard the devil is a strange compound of horror and something approaching sympathy. They believe in him religiously, but the terrible idea they ought to have of him appears to have been considerably modified by their natural kindness and their keen sense of humor. Now and then even an almost friendly sentiment may be traced in the allusions to him contained in the popular legends. In one of them, for instance, a little devil robs a peasant of the bread he had intended for his dinner. Coming to the spot where he had left the loaf, the peasant finds it has vanished. "Here's a wonder!" says the moujik, "I've seen nobody, and yet some one has taken my bread. Well, good luck to him! I dare say I shall not starve." The little devil goes and tells Satan, who feels uncomfortable at the idea of a man having been robbed who not only does not curse the thief, but even wishes him good luck. So he tells the inferior demon to go back and work for the peasant, so as to recompense him for the loss of his bread. The demon returns and manages so well that the peasant becomes a pros-

perous agriculturist. From such stories as these it seems as if the devil was supposed sometimes to assist the honest and sober, but he has the character of being always on the lookout for drunkards and ever ready to do them a bad turn. In one of the stories a man is described as being so poor that he is driven to take to sorcery. This brings him much into contact with devils, and he becomes on very friendly terms with them. Eventually he seeks a wife for his son amongst them, and they offer him a young female drunkard whom they have carried off to live with them. He accepts the proposal, but at the wedding-feast he hears Satan condemn a disobedient devil to the "gossip's bedstead." "What is that?" inquires the peasant. "It's a bedstead," is the reply, "intended for us devils and for all who have any thing to do with us. It's all on fire, and it goes running round and round on wheels." On hearing this, the peasant turns pious on the spot, and repents him of his unholy practices.

But perhaps the most curious of the stories of this class is that of "The Blacksmith and the Devil." There was once a blacksmith who was greatly struck by the figure of the devil—jet black, with horns and tail—as it appeared in the picture of the Last Judgment which hung in the village church. So he hired an artist to paint just such a devil for him on the doors of his smithy; and, every day, before beginning his work, he used to look at it and say, "Good-day, fellow-countryman!" At the end of ten years he died and was succeeded by his son, who never would say a civil word to the devil. On the contrary, he branded the image on the door every morning, and spat in its face on every church-festival. The devil bore this for a long time, but at the end of three years he could stand it no more. So he took the form of a youth and offered himself as a journeyman to the blacksmith, who accepted his services and soon found them invaluable. A month passed by, and one day the journeyman found himself alone in the smithy, just as an old lady came by in her carriage. Immediately he began crying aloud in the street, "There's a new business set up here; old people can be made young." The next moment the old lady was in the smithy, asking how much the process cost. "Two hundred rubles," was the reply. "There, take the money, and make me young again." So the devil took the money, and sent the old lady's coachman in quest of a bath of milk. Meanwhile he seized the old lady by the feet with his pincers, and dropped her into the furnace, where she was burned up, so that only her bones remained. These he threw into the milk when it arrived, and three minutes afterward the old lady emerged from the bath—alive, and young, and beautiful. The first thing she did on arriving at home was to send her husband to be made young also. The old gentleman went to the smithy and found the proprietor there alone, for the journeyman had disappeared. The blacksmith was naturally astonished at being desired to make the seigneur young again; but, when the process employed by his journeyman had been explained to him, he thought he might as well subject the old gentleman to it, especially as he was threatened with punishment if he refused to do so. So he placed him on the fire and consumed all but his bones, and these he flung into the bath of milk. But nothing came of these proceedings; the milk remained untroubled, and no old gentleman made his appearance either old or young. Down came the lady in her carriage after a time to ask, "Will my husband soon be ready?" When she heard what had taken place, she ordered her husband's murderer to be hanged at once. Immediately a gibbet was prepared, and the blacksmith was on his way to execution, when the journeyman suddenly reappeared. Going up to his unfortunate master, he made known who he really was, and then offered to set every thing right again if the blacksmith would promise to treat him respectfully for the future. A bargain was struck on the spot. The journeyman performed some mystical ceremonies over the milk, and the old seigneur was immediately restored to life, youth, and beauty. The lady was satisfied, and the smith was released. From that day forward he never ventured to maltreat the devil's picture in any way whatever.

One of the strangest characteristics of the Russian peasant is that, while he has the profoundest reverence for his religion, he very often has but little for its ministers. He is ready enough to bow down to the ground before a priest, but it is the office he reveres, and not the man. The ordinary Greek pope possesses little of the personal influence which the Roman priest generally enjoys, and even the prelates of his church do not always strike any great awe into the mind of the moujik, devout as he really is, and ever delighted to receive their benediction. Under these circumstances, it is not surprising to find

ecclesiastics described in very uncomplimentary terms in the stories which best please the common people in Russia. Here is a good specimen of the satires on priests, one which was found current, with slight variations, in different provinces: A certain pope served St. Nicholas for many years, but at last he found himself on the brink of starvation. So he tied all the church-keys together, and soundly thumped his patron's picture with them. Then he left the church, and wandered away where chance led him. After a time he met an old man, and agreed to become his companion. When they halted at night, it appeared that the pope had some biscuits with him, and the old man had two consecrated loaves. So the pope proposed they should first eat the loaves and then the biscuits. The old man consented, but it turned out that the loaves were miraculous, for they did not diminish, although the two companions supped heartily off them. This greatly astonished the pope, and, in the middle of the night, he got up and stole them. When the old man awoke and found his loaves had gone, he accused the pope of stealing them; but the thief denied any knowledge of the theft, and the old man put up quietly with his loss. The two companions continued their journey, and eventually came to a country where the king had a daughter who was so ill that he had promised great riches to any one who could cure her. The old man went with the pope to the king, said that he and his friend were foreign doctors, and undertook to cure the princess. So the invalid was handed over to him, and he took a sharp knife and cut her into little pieces, apparently without hurting her, for she uttered no cry. Then he washed the fragments in water, and afterward put them together and breathed on them. And, after he had breathed on them three times, the princess came to life, all safe and sound. The king was delighted, and offered the two doctors as much gold and silver as they liked. The old man took only a handful, but the pope stowed away as much as he could possibly carry. After a time the two companions came to another country, in which the king's daughter lay ill. But this time the greedy pope thought he would perform the cure alone, and reap all the reward. So he went to the palace, and obtained leave to operate on the princess. But, when he began to cut her into little bits, she screamed terribly, and continued to do so in spite of his remonstrances. At last, however, he succeeded in cutting her up, but, when he tried to bring her back to life, he failed utterly. So when the king came to look for his daughter, and found her turned into minced meat, he ordered the impostor to be hanged. When on his way to the scaffold, the pope was met by the old man. "Help me, old man!" he cried. "Who stole my loaves?" said the old man. "Not I, Heaven help me!" replied the pope. When he was mounting the steps he was again asked by the old man, "Who stole my loaves?" "Not I, Heaven help me!" was again his reply. As they put the noose round his neck, he a third time heard the question, "Who stole my loaves?" and he still replied, "Not I, Heaven help me!" Then the old man besought the king to postpone the execution, promising to cure the princess himself. The king consented, and the old man soon produced the princess in perfect health, whereupon the king was so delighted, that he not only pardoned the pope, but gave him much gold and silver. "Let us go and divide our money," said the old man. So they went away, and presently they stopped, and put all their gains together. These the old man divided into three portions. "Why so?" said the pope; "there are only two of us. For whom is the third heap?" "That is for him who stole my loaves!" said the old man. "I stole them," instantly exclaimed the pope. "There are the two portions for you, then, and take mine too. Go and serve faithfully in your parish; don't be greedy; and don't thump Nicholas with the keys." Thus spake the old man, and suddenly vanished.

It is generally St. Nicholas who comes to the aid of the distressed, sometimes assisting them even at the expense of a brother saint. In one of these legends, for instance, he is described as walking with the prophet Elijah through the fields of a peasant who held the saint in great reverence, but treated the prophet with marked disrespect. Elijah observes that he is going to punish the fellow soundly. So Nicholas privately warns the peasant, who, by the saint's advice, sells the crop as it stands to the priest of Elijah's church. A few days later, Elijah points with glee to the peasant's ruined crop—Elijah, as the peasants are well aware, directs the storms, the sound of the thunder being caused by the rumble of his fiery chariot, and the lightning by its blaze. Then Nicholas tells him that it is his own priest who has suffered, not the peasant. Elijah is sorry, and says he will

make the crop twice as good as before. Nicholas tells the peasant, who cancels the bargain with the priest, paying back half the purchase-money. Elijah soon after shows to Nicholas with delight the waving crop on the peasant's land. Then Nicholas tells him that his priest has no longer any interest in the matter. Elijah is very angry, and threatens some terrible reprisals, the nature of which he will not disclose. Nicholas perceives the matter is becoming serious, so he advises the peasant to get reconciled with the angry prophet. The next day, as the holy companions are walking along, they meet the peasant, who is carrying two candles—one very big, the other very small. "What have you got there?" asks Nicholas, pretending not to know. "Why, I've got a ruble candle for Elijah the prophet," says the peasant; "he's been so good to me. The hail ruined my crop, but he has managed to make it twice as good as it was at first; and I've got a kopeck candle, too, for Nicholas." This pleased Elijah so much that he gave up all idea of punishing the peasant, who, on his side, ever after honored the prophet's day as well as the saint's.

We are approaching the limits of our allotted space, and several of the stories we had marked for extraction still remain unnoticed. One of the most striking of these is "The Soldier and Death," which has many points in common with corresponding German traditions. A soldier, who had served for five-and-twenty years without getting his discharge, deserted. And, as he went, he met the Lord, to whom he told his story. Then the Lord said, "As thou hast served faithfully for five-and-twenty years, enter into Paradise." So the soldier went into Paradise, and at first he was delighted, but, after a time, he went up to the Holy Fathers, and asked, "Do they sell tobacco here?" "How, soldier, tobacco? this is Paradise." The soldier held his peace, and went back and walked about Paradise. Then he returned a second time to the Holy Fathers, and asked, "Is there any one near here who sells brandy?" "Ah, soldier, how could there be brandy here? This is Paradise, the kingdom of heaven." "What sort of Paradise is this? neither tobacco nor brandy!" said the soldier, and walked out of Paradise. Then the Lord sent him into Hell, and, as soon as he got there, he called for brandy and tobacco. So the devils brought him a pipe and half a bottle of spirit of peppermint, and he smoked and drank and enjoyed himself, saying, "This is Paradise indeed!" But, after a little time, the devils began to annoy him terribly. So he made a long wand, and began measuring, first one way, and then the other. "What are you about, soldier?" asked the devils. "Can't you see? I am going to build a monastery." Then the prince of the devils was frightened, and desired to get rid of him, but didn't know how. At last, however, he seized a little devil, skinned him, and made a drum out of his skin. Then he stood just outside the gates of Hell, and beat the alarm on the drum. The soldier came running out at once, and the devils immediately slammed the doors to, and shut him out. So the soldier went back to the Lord, and obtained the post of a sentry. While he was on guard, Death came to the gates, in quest of orders. The soldier went in to ask the Lord, and was told to command Death to go about killing the old people for three years. But the soldier thought of his aged parents, and told Death to go and kill the old trees for three years. Death went away to carry out this unexpected order, weeping bitterly. At the end of the appointed time, she returned, and was again tricked by the soldier, who sends her back to the forest. This occurred three times, and, when Death reappeared, was so reduced, that she could scarcely drag herself along. Then, at last, she obtained an interview with the Lord, who ordered the soldier to carry her for nine years on his shoulders. The story goes on to describe a number of other tricks played off on Death by the soldier before he succumbed to her himself.

One more story, and we will conclude. A certain toper dies, and his soul flies up to Paradise, and begins knocking at the gates. Then the apostle Peter comes to see who is there, and orders the noisy applicant to be off, saying, that perpetual torments are reserved for drunkards like him. But the toper bids the saint to remember how he denied his Master, and adds, "If it hadn't been for your tears and repentance, you wouldn't be now in Paradise—but I always drank on all holydays, and, at each gulp, I blessed the name of the Lord, and never denied Him." So St. Peter retires disconcerted. The next day a similar scene takes place, only, this time, it is David who comes to the gate, and him the toper discomfits by bidding him remember how he had served Uriah. On the third day the toper returns to the gate, and is met by St. John the Evangelist, who wishes to consign him to unquenchable fire. But the toper says, "Oh, my Lord John the Evan-

gelist, didn't you write in your Gospel that we should love one another? but now you hate me, and won't let me live in Paradise. Either deny your own handwriting, or else tear that leaf, which you wrote yourself, out of the book." On hearing this, St. John goes away and tells St. Peter to let that man enter into Paradise.

The specimens we have here given will be sufficient to convey some idea of the branch of folk-lore to which the Russian legends belong. Before very many years have elapsed they will probably, for the most part, have died out of the rustic mind, and will be treasured up only by the learned. The Russian peasant is still sufficiently superstitious, but he is beginning to evince a desire to emerge from that state of total ignorance which, in other days, favored the growth of various strange forms of belief, generally grotesque, but sometimes dignified by a touch of poetry and pathos. With the progress of that enlightenment by which it is to be hoped that Russia is about to benefit, the unsubstantial figures in which morbid forms of faith found apparent embodiment will naturally fade away and disappear. Then such stories as those we have quoted will possess an added interest, serving, as they will, to illustrate the state of popular belief in Russia in those dark ages of her history when her common people were little better than slaves, and the religion of the masses was a somewhat heathenish form of Christianity.

## LETTERS OF BISMARCK TO HIS WIFE.

THE second volume of the so-called "Bismarck Book," a very clever biography of the illustrious Prussian premier, by George Heseckiel, for which Bismarck himself furnished most of the materials, and the first volume of which achieved, a few months ago, a great popularity in Germany, will be published this spring in Berlin. It will contain a number of letters written by Count Bismarck to his wife, some of which we are now enabled to lay before our readers. We believe these letters, which Bismarck penned in the year 1852, during a diplomatic mission to the imperial court at Buda-Pesth, will excite the more interest as they show us the great Prussian statesman in an entirely new light—that of a brilliant and graceful writer, evidently endowed with much wit and humor, and a very lively and fervid imagination.

### *Bismarck to his Wife.*

"OFEN, June 28, 1852.

"I have just stepped from the steamboat, and do not know how to turn to better account the few moments remaining to me, until Hildebrand overtakes me with my luggage, than by sending you a little sign of life from this very eastern, but withal very beautiful, part of the world. The emperor has been gracious enough to assign to me quarters at his palace, and here I am sitting in a spacious arched hall at the open window, listening to the sweet evening bells of Pesth. The view is perfectly delightful. The palace is situated at a considerable elevation; underneath me there is, in the first place, the Danube, with its splendid chain bridge; behind it, I see Pesth, and farther on, beyond Pesth, the endless plain bathed in a flood of bluish-red evening hues. To the left of Pesth, I can look up the Danube; at a great distance on my left, that is to say, on the right bank, it is fringed, in the first place, by the city of Ofen; then follow mountains, blue and bluer, and finally brownish-red, in the evening sky glowing behind them. Between the two cities, there lies the broad sheet of water, as at Linz, broken by the chain bridge and a wooded island. The journey to this city, too—at all events, that from Gran to Pesth—would have delighted you. Imagine the Odenwald and Taunus moved close together, and the interval between them filled with the water of the Danube. The most unpleasant feature of the journey was the sun, which was as scorching as if Tokay were to grow on board the steamboat; and the number of passengers was enormous, but—can you believe it?—there were among them no English tourists whatever. I suppose they have not yet discovered Hungary. For the rest, there were among the passengers plenty of queer-looking fellows—representatives of all Oriental and Occidental nations, dirty ones as well as clean ones. My principal fellow-traveller was a very amiable general, with whom I sat and smoked almost all the time on the paddle-box. I am gradually growing impatient in consequence of Hildebrand's non-

arrival; I am lying in the window, gazing sentimentally at the moon and waiting for Hildebrand as eagerly as if he were a dearly-beloved sweetheart; for I am longing for—a clean shirt. I wish you were here for a few moments, and could now see the glimmering silver mirror of the Danube, the dark mountains upon the pale-red ground, and the countless lights gleaming up from Pesth. As the Hungarians have it, you would not sell Vienna, when compared with Buda-Pesth, at a very high price. You see, I am also an enthusiastic admirer of fine scenery. Hildebrand has arrived at last; I shall now soothe my excited blood by means of a cup of tea, and then go to bed.

"Last night I got but four hours' sleep; but the court consists of very early risers, the young emperor always rising already at five; so I should be a bad courtier if I should sleep much longer. Therefore, with a sidelong glance at a gigantic teapot, and a tempting tray with cold meats and preserves which I see is ready for me, I bid you good night from this distant place. I wonder where I heard the song which I have been thinking of and humming all day long to-day—'Over the blue mountain, over the white sea-foam, come thou, beloved one, come to thy lonely home!' I do not know who may have sung it to me 'in auld lang-syne.'

"JUNE 28th.

"After sleeping very well, though on a 'cuneiform' pillow, I bid you good-morning. The whole landscape before me floats in such a flood of burning sunlight, that I can hardly look out without getting dazzled. Until the time for paying my visits is at hand, I shall sit here, breakfasting and smoking, in a very spacious suite of four rooms, all of them arched and solidly built. Two of them are about as large as our dining-room; they have walls as thick as those of our house at Schoenhausen; they contain gigantic black-walnut clothes-presses, and the furniture is covered with blue silken stuff. On the floor I see a profusion of very large black spots, which an imagination more heated than mine might take for blood, but which I most decidedly declare to be ink; an incredibly awkward and clumsy scribe must have lived here, or another Luther may have repeatedly flung large ink-stands at the Evil One.

"A very pleasant old servant in a light-yellow livery assists Hildebrand in waiting on me. For the rest, everybody here is exceedingly amiable. In honor of the king's ambassador, the steamboat sailed yesterday under the large Prussian flag; and, thanks to the telegraph, a royal equipage was waiting for me at the landing. Do not mention it to N. N.; otherwise he would write newspaper articles about it. Below I see the queerest and wildest brown figures, with broad-brimmed hats and immense trousers, floating on long rafts down the Danube. I am sorry that I am no limner; these wild, mustached, long-haired faces, with the flashing black eyes, and the picturesque drapery hanging around them, I should like to have sketched for you, as I saw them all day long yesterday. But now I must close, and attend to my visits. I do not know when you will receive these lines; I shall probably send to-morrow, or day after to-morrow, a courier to Berlin, who may take them along.

"In the evening.

"I have not yet had an opportunity to forward these letters. The lights are gleaming up again from Pesth; lightning is flashing in the horizon toward the Theiss; but the sky above us is clear and starlit. I have worn my uniform nearly all day; at a private audience I presented my credentials to the young sovereign of this country, who made a very agreeable impression on me. After dinner the whole court made an excursion into the mountains—to the 'Beautiful Shepherdess'; she has, however, been dead for ever so long; King Matthias Corvinus loved her several hundred years ago. We had there—beyond the wooded heights, resembling those on the banks of the Neckar—a fine view of Ofen, its mountains, and the plain. A national festival had attracted thither a concourse of thousands of people; they were thronging around the emperor who mingled with them, while they cheered him with deafening *eljen's*, danced csardas and waltzes, sung, played, climbed the trees, and crowded around the members of the court. On a grassy slope there had been set a supper-table of about twenty covers, which, however, were laid on only one side of the table, that the prospect of the forest, castle, city, and plain, might be left free. Above us, there were tall beeches, with Hungarians climbing in the branches; behind us, and, moreover, very close by, a crowded, surging mass of people; farther on, buglers playing plaintive airs, and singers performing wild gypsy melodies. The illumination, the moonlight, the reddish hues left behind by the sun, the torches in the

forest—all might have figured, without any change whatever, as a very effective scene in a romantic opera. Beside me sat the white-haired Archbishop of Gran, the Primate of Hungary, in his black silken robe and red surplice; on the other side I had a very amiable and elegant cavalry officer. The picture, you see, abounded in contrasts. We then rode home in the moonlight, escorted by torch-bearers. Tell Mme. de V—— that her brother is a very amiable man; what I knew of his two sisters caused me to expect this. I just received a telegram from Berlin, containing only the word 'No.' A momentous word! They have told to me to-day all about the assault which the insurgents made, three years ago, upon this castle, on which occasion the gallant General Hentzi and the whole garrison, after a marvellously intrepid defence, were put to the sword. The black spots on my floor are, in great part, burns; and where I am now writing to you exploding shells were bobbing around at that time, and there was a terrible hand-to-hand fight on the smoking ruins. It was not until a few weeks since that the castle was fitted up again for the reception of the young emperor. Now, every thing up here is very quiet and comfortable; I hear only the ticking of a large clock and the distant roll of carriages below. I hope angels may be watching over you; as for me, a grenadier with a busby on his head is performing that duty; I see six inches of his bayonet, at two arms' lengths, protruding above my window-board. He stands on the terrace above the Danube, and is probably thinking of his 'Nanni.'

"SZOLNOK, June 27, 1862.

"In our atlases you will find a map of Hungary, and on it the Theiss River; and, if you will follow that up to its source, beyond Szegedin, you will see a place named Szolnok. I rode, yesterday, on the cars from Pesth to Alberti-Josa, where a Prince W——, who is married to a Princess of M——, has his headquarters. I waited upon the princess, in order to be able to inform——how she was doing. The place is situated on the edge of the Hungarian steppes, between the Danube and Theiss, which I was anxious to see. I was not allowed to travel without an escort, inasmuch as gangs of mounted robbers, who are here called Betyares, infested that part of the country. After dispatching an excellent breakfast, in the shade of a lime-tree like ours at Schoenhausen, I mounted a very low country wagon, with straw sacks, and drawn by three steppe-horses. The lancers loaded their carbines, vaulted into the saddle, and we set out at the full gallop. Hildebrand and a Hungarian valet occupied the front sack, and the driver, a dusky peasant with a mustache, a broad-brimmed hat, long, glossy-black hair, and a shirt terminating above the stomach, and leaving visible six inches of his dark skin, up to the place where the trousers commence; each leg of these trousers is large enough to serve as a woman's petticoat, and they reach down to the knees, where the spurred boots commence. Fancy a very solid, grassy plain, as level as a table, on which you see, for many miles, up to the horizon, nothing but the tall, naked poles of the wells dug for the half-wild horses and oxen—thousands of brown-and-white oxen, with horns as long as our arms, and as fleet-footed as game—of shaggy, repulsive horses, guarded by mounted, half-naked herdsmen with lance-like sticks—immense herds of swine, among which there may always be discerned a donkey bearing the swineherd's fur-robe (*bunda*), and occasionally himself—then large numbers of bustards, hares, and mole-like shrew-mice—now and then a small pond with brackish water, at which are to be seen flocks of geese, ducks, and plovers—such were the objects which darted past us, and which we darted past, during the three hours in which we performed the thirty-two miles to Ketskemet, stopping a short time at a *csarda* (a wayside inn). Ketskemet is a village, whose streets, when one does not see any of the inhabitants, reminded me of the small end of Schoenhausen, only it has forty-five thousand inhabitants, unpaved streets, and low houses, closed, in the Oriental style, toward the sun, with large cattle-yards. A foreign ambassador was such an unusual visitor there, and my Magyar valet alluded to me so often as 'His Excellency,' that a guard of honor was immediately furnished to me; the authorities waited on me, and fresh horses were ordered to be put to my carriage. I passed the evening with the very amiable officers of the garrison, who insisted on my taking along an escort for the remainder of my trip, and told me a great many stories about highway robbers and murderers. The part of the country which I was bound for, they said, was most infested by robbers in the swamps and deserts on the bank of the Theiss, where it was well-nigh impossible for the government to exterminate them. They are splendidly mounted and armed, these Betyares, and attack travellers and

farm-houses in gangs of from fifteen to twenty men, and next day they are already seventy or eighty miles away. Decent people they always treat very politely. Most of my funds I had left with Prince W——; I had taken with me only some linen, and, to tell you the truth, I was rather anxious to form the acquaintance of these mounted robbers in their long fur robes, with double-barrelled rifles in their hands, and pistols in their belts, whose leaders are said to wear black masks, and not unfrequently belong to the petty country nobility. A few days ago some gendarmes had fallen in a skirmish with them; but, in return, two of the robbers had been caught, and, after a trial by a drum-head court-martial, shot. Such things never occur in our tedious country. At the time you awoke this morning, you hardly imagined that I and Hildebrand were speeding at a terrible gallop at that very moment across the steppe in Kumania, between Telegyhaza and Csonygrad. Beside me sat an amiable, sunburnt officer of the lancers; our loaded pistols were lying in the hay before us, and a squad of lancers, with their cocked carbines in their hands, were galloping behind us. Three fleet-footed little horses were drawing our vehicle; they are always called *Rosa Csillack* (Star), and *Betyare* (Vagabond). The driver incessantly calls them by name, and speaks to them in a beseeching tone, until he holds the handle of his whip obliquely over his head, and shouts, '*Mega, mega!*' (stop!), when the gallop grows more furious than ever. Oh, such a ride is splendid! The robbers did not make their appearance; my nice, amiable lieutenant told me they must have known already before daybreak that I was travelling with an escort; but he was quite sure that there were some of them among the dignified-looking peasants who gravely contemplated us at the stations in their long and sleeveless sheepskin cloaks, and saluted us with an unctuous '*Isten adiamek!*' (God be praised!). The heat was very oppressive all day, and my face is, as red as a crayfish. I performed nearly eighty miles in twelve hours, from which from two to three hours, and perhaps more, have to be deducted on account of the changing of the horses—the twelve horses which I and the escort needed having to be caught in the plain. One-third of the road, moreover, was as sandy as the downs at Stolpmünde. At five I arrived at this place, where a motley throng of Hungarians, Slavonians, and Wallachians enlivens the streets (Szolnok is a village of about six thousand inhabitants, but a railroad and steamboat station on the Theiss), and the wildest and craziest gypsy melodies fall on my ears as I am sitting in my room. They sing through their noses, and with their mouths distended to their utmost, in sickly, plaintive strains, stories about black eyes and the gallant death of a robber, in tones reminding me of the storm-howling Lettish airs in the chimney. The women, in the main, are well-proportioned, and some of them are surpassingly beautiful; all of them have very black hair, bound in braids behind, and interwoven with red ribbons. What with their bright-green and red handkerchiefs, or gold-embroidered caps of red velvet on their heads, very beautiful yellow shawls, a silken handkerchief around their shoulders and breasts, very short black or deep-blue petticoats, and high red-morocco boots, and, with their dark complexion, and large and flashing black eyes, a group of these women always presents a variegated spectacle which would please you, every color of their dress being as striking and bright as it could be. After my arrival at five o'clock, while waiting for my dinner, I bathed in the Theiss, saw the people dance the *csarda*, and regretted that I was no limner so as to be able to sketch for you the wild figures I saw here; then I dined on *paprika háhorde! stírl* (fish) and *tick*, drank some Hungarian wine, wrote to you, and now want to go to bed, if the gypsy music will allow me to sleep. Good-night. *Isten adiamek!*"

"PESTH, June 28, 1862.

"Again I see the Ofen Mountains, but this time from the Pesth side, that is to say, from below. In the plain which I have just left, the blue outlines of the Carpathian Mountains were seen only now and then, and, when the air was very clear, at a distance of from twelve to fifteen geographical miles. Toward the south and east the plain remained seemingly endless; and, in the former direction, it extends far into Turkey; in the latter into Transylvania. The heat was terrible again to-day; it has perfectly scorched the skin of my face. Now there is a warm hurricane, sweeping so impetuously across the steppe that it causes the houses to tremble. I have bathed in the Danube, looked at the magnificent chain bridge from below, paid some visits, heard very excellent gypsy music on the promenade, and will soon go to bed. The scenery of the *Puszta*, where it begins to be little more cultivated, reminded me of Pomerania, especially of the country in the

neighborhood of Rommelow, Romaher, and Coseger. The faces of the gypsies are grayish-black; their costumes are perfectly fabulous. The children go entirely naked, except that they wear strings of beads around their necks. Two of the women had beautiful, regular features, and they were cleaner and better dressed than the men. When the Hungarians wish to encore a dance, they exclaim, in seeming astonishment, '*Hody wol? Hody!*' (How was that? How?), and look at one another inquiringly, as if they had not understood it right, although they know the music by heart. They are a singular people in every respect, but I like them very well. My escort of lancers was not so bad after all. At the same time when I left Ketskemet, in a southern direction, sixty-three wagons set out for Körös, in the north. Two hours afterward they were stopped and plundered. The robbers fired a few bullets after a colonel who happened to drive at the head of this caravan, and refused to halt; one of his horses was shot through the neck, but it did not fall; and, as the colonel and his servants, as they drove away at the full gallop, returned the fire, the fellows preferred to content themselves with what booty they might obtain from the other travellers. They did not hurt anybody, but robbed some persons; they do not take every thing from their victims, but demand of every one a sum corresponding with his fortune and their own wants. For instance, when asking for forty florins, they allow the traveller to pay them that sum from a wallet containing one thousand florins, without touching the remainder. So they are not such very bad robbers after all."

### THE CULTURE OF THE SILK-WORM.

IN Louis Figuier's "*Insect World*" there is a collection of the most valuable known facts in regard to the rearing of silk-worms, and the preparation of silk in its earlier stages. These caterpillars, which become moths, have gained the designation of "the dog of insects," because they have been domesticated from the most ancient times, and have lost a great part of their strength in the process. The cultivated moth is not strong enough to sustain itself in the air, nor even on the leaves of the mulberry, when they are agitated by the wind. The female, always motionless, seems ignorant that she has wings. The male, when on the ground, flutters around his companion, but no longer flies. After three generations of rearing in the open air, the males recover their lost power.

The history of silk cultivation loses itself in antiquity; but China is generally given the credit of possessing the first knowledge on this subject. The name of the Empress Ti-ling-chi is even mentioned as the one who first succeeded in rearing the worms and in unwinding the silk. This is said to have been two thousand six hundred years before our era; and it is also said that, prior to that discovery, the Celestials wore the skins of beasts for clothes. It is questionable if this empress is not a myth, and only a Chinese Ceres who represents the birth and growth of this important agricultural or insect industry. It is certain that the old emperors protected the mulberry-trees by stringent decrees, which encouraged their cultivation and punished their destruction. The exportation of the eggs of the silk-worm was strictly forbidden.

Babylon and India had their silks at very early dates, but probably obtained the material from China.

In the time of Alexander the Great, silk was worth its weight in gold, and was woven so thin, that the women of Greece were scarcely covered by the delicate tissues. Julius Caesar introduced it into Rome, and sometimes replaced the coarse cloth, used to keep sun and rain from the amphitheatres, with the silks of the Orient. The populace murmured at the taxes involved in the cost, but applauded the greatness which could provide such shows.

Constantinople and Greece furnished Europe with silk-worms for centuries. In the eighth century the Arabs introduced them into Spain. From Greece the caterpillars were taken to Sicily during one of the frequent wars, and thence the art of making silk spread over Italy. France saw this element of her national wealth grow up in the reign of Henry IV.

The silk-worm has nothing alluring in its appearance; it is like an humble workman in a white blouse, with nothing brilliant in its own dress, but giving the whole world its most beautiful and gorgeous array. The body of the silk-worm has thirteen distinct segments. In the front are three pairs of articulated legs; in the middle and

toward the posterior part are five pairs of membraneous legs, furnished with a circle of very fine bristles, which assist the animal to hook itself on to leaves and stalks. On the two sides of its body are eighteen stigmata, or respiratory mouths. Its process of gnawing and absorbing the mulberry-leaf is very peculiar. The mouth is provided with six small articulated pieces; a hollow in the upper lip receives the edge of the leaf, and beneath two large jaws cut the leaf as a pair of scissors. Underneath, weaker jaws divide the fragments, and a small organ, articulated on each jaw, pushes them back toward the mouth, and prevents the smallest fragment of the leaf from falling. The leaf, passing into glands, is converted into silk by processes unknown to man. Efforts have been made to obtain silk directly from the mulberry-leaf, but without success, the organs of the insect being laboratories which art cannot substitute. It was once hoped that, by taking from the body of the worm the viscous matter in the glands, silk could be formed. A very inferior, almost worthless, thread was obtained; but it was evident that the silk must not only be elaborated, but emitted by the worm itself. The worm moults several times; in each successive stage it changes its color, and is always remarkably voracious just before the time for moulting. The last interval is the longest, and just before the termination of its caterpillar existence it eats with extraordinary activity. Where there is a large collection of them, the noise their jaws make is like a heavy shower of rain. When the time draws near for its metamorphosis into a chrysalis, the worm becomes restless, wanders away from its food, which it never did before, and seeks for a suitable place in which to establish its cocoon. It begins this task by throwing from different sides threads destined for fixing the cocoon; the proper space having been ascertained by this means, the worm begins to unwind its thread, which it arranges around its body, describing ovals with its head. About the fourth day, after having expended all its silk, the worm, shut up in the cocoon, becomes of a waxy white color; the skin wrinkles; very soon it is detached and pushed downward, and the chrysalis appears under the rents in the skin. In fifteen or sixteen days the moth appears, and escapes from its silken prison by moistening the threads with a liquid, by which they are disunited, but not broken, and through the threads thus separated the insect makes its way to the light of day.

The rearing and culture of the silk-worm is of course an important industry. After procuring good eggs, the most essential point is to possess premises in which the air is easily renewed. The worms must have all the air possible, and yet must never be chilled. This is usually attained by keeping a constant fire in an open room, and by letting air into the room from another chamber which separates it from the open air. In the rearing-room are arranged racks, by the side of which are placed frames made of reeds. These frames are placed in such a manner that one can easily pass round them to place and remove the worms, and to distribute the leaves uniformly. A cellar, or cool room, is necessary in which to stow away the leaves as soon as they are brought in from the country. In large rearing establishments there is a special chamber for incubation. The eggs are spread out on sheets of paper, placed on a table in a room having a southern aspect, taking care that the rays of the sun shall not reach them. After three or four days a fire is lighted, and day by day the heat gradually increased. As soon as the worms are hatched, the eggs are covered with a net, and over them are placed mulberry-boughs, covered with tender leaves, on which all the little worms congregate. They are then lifted off with a hook made of thin wire, and the worms are placed on a table covered with paper. They are given as their first meal tender leaves cut into small pieces. During the first age, the period preceding the first moult, they are fed six or eight times a day, care being taken to distribute the food as equally as possible. When the moult approaches, the young ones are made to climb on to boughs having tender leaves, so that they can be moved to litters as thin and clean as possible, and there sleep in a good state of health. When the mass of worms is well awake again, a net is spread over them, the meshes of which are broad enough for them to pass through. On this net are spread young leaves, and the worms, immediately leaving the old food, proceed to the new. This process is repeated through each successive age. When the last age approaches its termination, and the chrysalis state is near, sprigs of heather are placed so that the worm—which at this period has a great disposition to mount—can ascend into them, and spin its cocoon.

The conditions most important in rearing the silk-worm are, proper and equable heat and thorough ventilation. The most precarious

A Silk-worm Rearing Establishment.

period is the time after the last moult. When the worms awake from their sleep they are liable to various diseases, and hence require the utmost care and watching.

When the cocoons are completed, the person in charge separates

them from the heather, and sells them to the silk-spinners. But the chrysalis within the cocoon must first be destroyed, in order to prevent the moth from piercing its silken covering. This is done by exposing the cocoon to steam, in which the chrysalide is stifled.

Silk-winding Establishment.

The cocoons which are retained in order to produce eggs for the next year are fixed on sheets of brown paper, covered with a slight coating of paste. Male and female cocoons, ascertained by the fact that the female is always the heavier, are kept on separate sheets. When the moths appear, they are seized by the wings and placed on cloths stretched out for the purpose. They presently evacuate a red liquid; the males and females are then placed together; after copulation they are separated. Sheets of paper are placed on screens, suitably inclined, on which the females are laid. Here the moths lay their eggs. The sheets of paper, covered with eggs, are then hung on wires in a room which is never warmed. Here they remain until the hatching-season returns.

Having thus given a rapid survey of the method of rearing the silkworm, a few words in reference to the winding of the cocoon may be of interest. This is an operation requiring great experience, unremitting attention, and an almost exceptional delicacy of touch. The woman who is spinning stands before a sort of loom which is called *tour*. Under her hand is a copper containing water, which she heats to the required degree by opening the top of a tube, which brings a current of steam. She plunges the cocoons into hot water, and moves them about in it, to soften the gummy substance which sticks the silken threads of the cocoon together. Then she beats them with a light hand, with a small birch broom. She now attempts to make up a staple, or *brin*, by uniting together the ends of five cocoons. The five ends are held in a mass, and introduced into the hole of a frame, suited for the purpose. Two staples are made at once, one on the right hand, the other on the left. The worker then brings them together, crosses them, rolls them, and twists them, the one on the other, several times, after which she separates them from above and keeps them well apart, making each of them pass into a hook at a distance from which they are going to twist round into a hank, separately, on a wheel. The two threads thus twisted are drawn close together, compressed, and become one, getting round by rolling on each other, and being kept in continual motion, drawn out as they are by the rapid motion of the wheel.

## FLAG OF MY COUNTRY.

AN UNPUBLISHED POEM, BY FITZ-GREENE HALLECK, WRITTEN IN CAMP AT GREENWICH, 1814.

FLAG of my country! proudly wave  
High to the favoring breezes of heaven,  
The rallying-point that forms the brave  
Whene'er the battle-word is given.

As when at evening on the deep,  
From their loved firesides distant far,  
Their anxious eyes the sailors keep,  
Fixed on their guide, the Northern star:

So on thy stars, in danger's day,  
The warrior turns his daring eye,  
And dauntless treads the crimsoned way,  
Through honor's path, to victory.

When first their eagle met the gale,  
Our fathers bade these shores be free,  
And long, where slaughter strewed the vale,  
They fearless fought and bled for thee,

Till England's banner-cross was furled,  
And Peace her olive-branch displayed;  
Then, 'mid the plaudits of a world,  
They sheathed the consecrated blade.

Yet once again the trump of War  
Has bade the dream of Peace be o'er,  
Again Invasion's crimson car  
Drives threatening round our hallowed shore.

But shall that flag which on the billow  
So late has won Fame's laurel-wreath,  
Which formed a hero's \* dying pillow,  
And wrapped his pallid corse in death—

Say, shall that flag e'er share the fate  
Of Gallia's fallen *tri-color*;  
Shall History say, "It once was great,  
But soon it fell to rise no more?"

No! while within each manly breast  
Burns one faint spark of valor's flame,  
While Glory lifts its glittering crest,  
And Honor points the path to fame,

While spring adorns with flowerets fair  
The grass where low our fathers lie—  
So long its stars shall blaze in air,  
So long to heaven's breezes fly.

Flag of my country! proudly wave,  
Nor dread the invaders' bold command,  
While nobly fight the good and brave  
For Freedom and their native land.

## SKETCHES OF EARLY LIFE IN BOSTON.

### No. III.

#### HOW THEY CONDUCTED PUBLIC WORSHIP IN BOSTON.

THE religious phraseology of the first settlers in Massachusetts was carefully constructed, with the view of avoiding, not only every thing which in itself savored of superstition, but also, as it would seem, of disengaging themselves, as far as possible, from all the associations that were connected with a communion which they had renounced. They were always scrupulous in designating the *place* of worship as a meeting-house, and not as a church—the days on which divine services were held, they called lecture-days—and the clergyman was known as a teacher, or a teaching-elder, in distinction from the ruling-elder, as there were usually two such officials presiding over each congregation. These were, at first, not only elected by the people, but also set apart for their work, or ordained to the ministry, by delegates chosen from the congregation.

The first meeting-house erected in Boston was a humble structure, of which nothing is known except that the walls were of mud and that the roof was covered with thatch. This, however, remained standing only for nine or ten years, when it was replaced by a building of wood, which stood for seventy-one years in Washington Street, opposite to the head of State Street, when it was destroyed by fire.

There is nothing to indicate what was the precise style of architecture adopted in those days, unless it may be inferred from the character of a small building now to be seen in the city of Salem, which has recently been discovered and restored, as far as practicable, to its original condition, and is supposed to be the edifice in which Roger Williams formerly preached. One thing we may be sure of, that, in these structures, there was a careful avoidance of every thing bordering upon ecclesiastical symbolism. What the old divines, who once thundered against the pomps and vanities of the church, as well as of the world, would say, if they should now get a glimpse of the gorgeous temples in which their children worship, may be readily imagined.

In 1676 we find the following singular enactment: "Ordered, that hereafter no pew shall be built *with a door into the*

\* Captain James Lawrence, of the *Chesapeake*.

street; and if the builder of the pew leave the house, before the close of the exercises, the pew shall revert to the church."

We get a clew to the meaning of this law by referring to another, passed some years before, whereby "all Christian people are forbidden to have lectures, during the week, before one o'clock; it being prejudicial to the public good to *lose a whole day*." "There were so many lectures now in the country," writes Mr. Winthrop, "and many poor persons would usually resort to two or three in a week, to the great neglect of their affairs, and the damage of the publick. The assemblies also were held till night, and sometimes within the night, so as such as dwelt far off could not get home in due season, and many weak bodies could not endure so long in the extremity of the heat or cold, without great trouble and hazard of their health. Whereupon the General Court ordered, that the elders should be desired to give a meeting to the magistrates and deputies, to consider about the length and frequency of church assemblies. This was taken in ill part by most of the elders and other of the churches—they alleging that *liberty for the ordinances* was the main end of our coming hither." Considering the infirmities of human nature, it is not very strange that the less godly among the people should have caused these private doors to be cut in the side of the meeting-house, and occasionally escape thereby, for an hour or two, from the long services inflicted upon them.

Good Mr. Winthrop writes thus in his journal, 1639: "Mr. Hooker being to preach at Cambridge, the governor and many others went to hear him (though the governor did very seldom go from his own congregation upon the Lord's day). He preached in the afternoon, and having gone on, with much strength of voice and intention of spirit, about a quarter of an hour, he was at a stand, and told the people that God had deprived him both of his strength and matter, etc., and so went forth, and, about half an hour after, returned again, and went on, to very good purpose, *about two hours*." This must have been quite a moderate performance, so far as its length was concerned; but, when it came to prayers and sermons stretching through a whole day, and never ceasing till the going down of the sun—*relays* of ministers being on hand to take up the doctrine, as one after another gave out—and when we consider still further that all able-bodied persons were obliged to be present at public worship, under severe penalties for unnecessary absence, it is difficult to avoid having some little sympathy with those feeble folk, who "built their pews with a door into the street."

How the young people and children managed to live through these interminable performances, and behave with any sort of propriety, is a great marvel; especially when we remember that the services consisted of nothing but prayers and sermons, most of which it must have required a well-trained theologian to comprehend. No public reading of the Scriptures was ever allowed, and, for nearly a century, there was no singing to relieve the dreary monotony of the service.

In Drake's History of Boston we are told that, in 1722, "the subject of singing in churches was making considerable talk both in town and country." Some thought it to be a great innovation, and not to be tolerated. The Rev. Thomas Symmes wrote this year a tract in favor of "regular" singing. It was accompanied by a recommendation as follows: "We, the subscribers, willing to countenance and promote regular singing, or *singing by note*, do signify our approbation of the substance and design of the ensuing dialogue." We are not surprised that singing in churches was not popular when it was first introduced, if every one lifted up his voice at discretion, as would seem to be implied by the fact that singing *by note*, or "regular singing," was unknown previous to the year 1722.

It is, however, proper for us to allude to one custom, growing out of the necessity of the times—when there were no newspapers, and no other mode of communicating public intelligence existed—which must, in a measure, have tended to re-

lieve the tediousness of the services. At a certain interval of worship, the appointed officer rose in his place, and proclaimed aloud such items of general moment as it was important for the congregation to know. How often, in our childhood, have we waited for the town-clerk to stand up in his pew and publish, in like manner, "the intentions of marriage" between A and B! On the records of the court there had been a special provision to this effect: "Any swine caught at large, without a keeper, must be cried out at the two next public lectures. Even in those quiet days there was probably some sense of the ludicrous still lingering in the nature of the people, and we can easily imagine that the minute descriptions which would sometimes necessarily attend these "cryings out," in order to the due identification of the straying animals, might somewhat interfere with the gravity of worship; and, accordingly, the law was afterward so altered as to provide for affixing to the meeting-house door the notice of all errant swine, instead of publishing them in meeting.

We may remark that the legislation of the General Court, bearing in various ways upon this description of animals, is uncommonly copious, and, after a while, became so troublesome that the whole matter was committed to the several towns, the last entry on this subject being as follows: "Thomas Starr is accused of saying that the law about swine is against God's law, and he would not obey it." What the particular enactment was, which Mr. Starr regarded as contravening the Scriptures, does not appear; we only know that his appeal to the "higher law" did not save him from punishment.

Returning to the subject more immediately before us, we observe that the first ministers of Boston were, in certain respects, very scrupulous in the administration of Christian ordinances. The Rev. John Cotton arrived in Boston in 1633. "On Saturday evening the congregation met in their ordinary exercise, and Mr. Cotton, being desired to speak to the question (which was of the church), he showed, out of the Canticles, that some churches were as queens, some as concubines, some as damsels, and some as doves. He was then propounded to be admitted as a member. The Lord's day following he exercised in the afternoon, and, being to be admitted, signified his desire and readiness to make his confession according to order, which he said might be sufficient in declaring his faith about baptism, which he then desired for his child, born in their passage, and therefore named Seaborn. He gave two reasons why he did not baptize it at sea (not for want of fresh water, for he held sea-water would have served): 1. Because they had no *settled* congregation there; 2. Because a minister hath no power to give the seals but in his own congregation."

One of the popular sermons of the day is thus entitled "On the impropriety of children's asking their parent's blessing on *their knees*." Certainly, in our day, there is no special call for enlarging upon such an evil as this; children are no much given to asking their parent's blessing in any attitude.

It is a great mistake to suppose that the preaching in those times was confined to the elaborate unfolding of dogmatic theology; nothing could be done in the community of any moment that did not attract the notice of the pulpit. Alas, for the man who speculated in flour, or gave short measure, or sold inferior goods, in those days! A case in point occurred in 1639, when Mr. Robert Keiane, who kept a shop in Boston, ventured to sell his wares for a larger profit than was considered equitable by the community; his offence being aggravated by these especial circumstances: "1. He being an ancient professor of the Gospel. 2. A man of eminent parts. 3. Wealthy and having but one child. 4. Having come over for conscience sake, and for the advancement of the Gospel here." This speculative gentleman, having been first cited to appear before the magistrates, and fined two hundred pounds—what a source of revenue to-day lies undeveloped!—was then summoned before the church, "where, as, before, he had done in the court he did, with tears, acknowledge and bewail his covetous and

corrupt heart"—what an *acknowledging* and *bewailing* would now fill the land, if all our overreaching traders and speculators were called to make public confession of their sin!—"yet making some excuse for many of the particulars which were charged upon him, as partly by pretence of ignorance of the true price of some of his wares, and chiefly by being misled by some false principles, as: 1. That, if a man lost in one commodity, he might help himself in the price of another. 2. That if, through want of skill or other occasion, his commodity cost him more than the price of the market in England, he might then sell it for more than the price of the market in New England," etc. These things gave occasion to Mr. Cotton, in his public exercise on the next lecture-day, to lay open the error of such false principles—and "very faithfully does he appear to have discharged his duty." After this came up the question of Mr. Keiane's excommunication, but, upon the whole, as he was not in general reputed to be a covetous person, and had always been liberal in his hospitality and in his contributions to the church, he was let off with an admonition. There are "various points of application," in view of the present aspect of things, which the reader will probably make for himself.

The power of the pulpit, in the early days of Boston, was almost unlimited. And when we consider the intellectual superiority of the men who filled the position of "lecturers"—for, at the time, this was the only field open where persons of high ability could exercise their power—when we remember that there were few books to be had, and that no periodical literature existed; that the government was virtually a theocracy, where, without the priestly name, priestly prerogatives were exerted without limit; when we recall the fact that, two or three days in every week, the people were called to listen to the preacher hour after hour, and that his dictum was law, his review of public or private acts final, his condemnation the verdict of Heaven—our only wonder is that such an agency was not more widely abused. It was absolute and tyrannical; but it was a *well-intended* despotism. It aimed at good results, although it was relentless in its modes of reaching them. It sought to win men from the world, and, one way of doing this was, to make the world as disagreeable an abode as possible.

The modes of worship adopted by a people are always significant of the national character. Applying this rule to the case before us, we should say that the prominent characteristics of the early settlers of Boston were earnestness, rigid conscientiousness, sobriety, exclusiveness, and narrowness. They may have cultivated flowers, but it could not have been because of their beauty and fragrance—most probably it was in order to extract their medicinal properties.

We shall next proceed to show how they treated heretics and schismatics in Boston.

IMAGINATION IN THE PROGRESS OF MORALS.

By W. E. H. LECKEY.

IT is sufficiently evident that, in proportion to the high organization of society, the amiable and the social virtues will be cultivated at the expense of the heroic and the ascetic. A courageous endurance of suffering is probably the first form of human virtue, the one conspicuous instance, in savage life, of a course of conduct opposed to natural impulses, and pursued through a belief that it is higher or nobler than the opposite. In a disturbed, disorganized, and warlike society, acts of great courage and great endurance are very frequent, and determine, to a very large extent, the course of events; but, in proportion to the organization of communities, the occasions for their display, and their influence when displayed, are alike restricted. Besides this, the tastes and habits of civilization, the innumerable inventions designed to promote comfort and diminish pain, set the current of society in a direction altogether different from heroism, and somewhat emasculate, though they refine and soften, the character.

Asceticism again—including, under this term, not merely the mo-

nastic system, but also all efforts to withdraw from the world, in order to cultivate a high degree of sanctity—belongs naturally to a society which is somewhat rude, and in which isolation is frequent and easy. When men become united in very close bonds of coöperation, when industrial enterprise becomes very ardent, and the prevailing impulse is strongly toward material wealth and luxurious enjoyments, virtue is regarded chiefly, or solely, in the light of the interests of society, and this tendency is still further strengthened by the educational influence of legislation, which imprints moral distinctions very deeply on the mind, but, at the same time, accustoms men to measure them solely by an external and utilitarian standard. The first table of the law gives way to the second. Good is not loved for itself, but as the means to an end. All that virtue which is required to form upright and benevolent men is, in the highest degree, useful to society, but the qualities which constitute a saintly or spiritual character, as distinguished from one that is simply moral and amiable, have not the same direct, uniform, and manifest tendency to the promotion of happiness, and they are accordingly undervalued. In savage life, the animal nature being supreme, these higher qualities are unknown. In a very elaborate material civilization the prevailing atmosphere is not favorable either to their production or their appreciation. Their place has usually been in an intermediate stage.

On the other hand, there are certain virtues that are the natural product of a cultivated society. Independently of all local and special circumstances, the transition of men from a barbarous or semi-civilized to a highly-organized state necessarily brings with it the destruction or abridgment of the legitimate sphere of revenge, by the transfer of the office of punishment from the wronged person to a passionless tribunal appointed by society; a growing substitution of pacific for warlike occupations, the introduction of refined and intellectual tastes which gradually displace amusements that derive their zest from their barbarity, the rapid multiplication of ties of connection between all classes and nations, and, above all, the strengthening of the imagination by intellectual culture.

This last faculty, considered as the power of realization, forms the chief tie between our moral and intellectual natures. In order to pity suffering, we must realize it, and the intensity of our compassion is usually and chiefly proportioned to the vividness of our realization. The most frightful catastrophe in South America, an earthquake, a shipwreck, or a battle, will elicit less compassion than the death of a single individual who has been brought prominently before our eyes. To this cause must be ascribed the extraordinary measure of compassion usually bestowed upon a conspicuous condemned criminal, the affection and enthusiasm that centre upon sovereigns, and many of the glaring inconsistencies of our historical judgments. The recollection of some isolated act of magnanimity displayed by Alexander or Cæsar moves us more than the thought of the 30,000 Thebans whom the Macedonian sold as slaves, of the 2,000 prisoners he crucified at Tyre, of the 1,100,000 men on whose corpses the Roman rose to fame. Wrapped in the pale winding-sheet of general terms, the greatest tragedies of history evoke no vivid images in our minds, and it is only by a great effort of genius that an historian can galvanize them into life. The irritation displayed by the captive of St. Helena in his bickerings with his jailer affects most men more than the thought of the nameless thousands whom his insatiable egotism had hurried to the grave. Such is the frailty of our nature, that we are more moved by the tears of some captive princess, by some trifling biographical incident that has floated down the stream of history, than by the sorrows of all the countless multitudes who perished beneath the sword of a Tamerlane, a Bajazet, or a Zenghis Khan.

If our benevolent feelings are thus the slaves of our imaginations, if an act of realization is a necessary antecedent and condition of compassion, it is obvious that any influence that augments the range and power of this realizing faculty is favorable to the amiable virtues, and it is equally evident that education has in the highest degree this effect. To an uneducated man, all classes, nations, modes of thought and existence foreign to his own, are unrealized, while every increase of knowledge brings with it an increase of insight, and therefore of sympathy. But the addition to his knowledge is the smallest part of this change. The realizing faculty is itself intensified. Every book he reads, every intellectual exercise in which he engages, accustoms him to rise above the objects immediately present to his senses, to extend his realizations into new spheres, and reproduce in his imagination the thoughts, feelings, and characters of others, with a vividness incon-

ceivable to the savage. Hence, in a great degree, the tact with which a refined mind learns to discriminate and adapt itself to the most delicate shades of feeling, and hence, too, the sensitive humanity with which, in proportion to their civilization, men realize and recoil from cruelty.

We have here, however, an important distinction to draw. Under the name of cruelty are comprised two kinds of vice, altogether different in their causes and in most of their consequences. There is a cruelty which springs from callousness and brutality, and there is the cruelty of vindictiveness. The first belongs chiefly to hard, dull, and somewhat lethargic characters, it appears most frequently in strong and conquering nations and in temperate climates, and is due in a very great degree to defective realization. The second is rather a feminine attribute, it is usually displayed in oppressed and suffering communities, in passionate natures, and in hot climates. Great vindictiveness is often united with great tenderness, and great callousness with great magnanimity, but a vindictive nature is rarely magnanimous, and a brutal nature is still more rarely tender. The ancient Romans exhibited a remarkable combination of great callousness and great magnanimity, while, by a curious contrast, the modern Italian character verges manifestly toward the opposite combination. Both forms of cruelty are, if I mistake not, diminished with advancing civilization, but by different causes and in different degrees. Callous cruelty disappears before the sensitiveness of a cultivated imagination. Vindictive cruelty is diminished by the substitution of a penal system for private revenge.

The same intellectual culture that facilitates the realization of suffering, and therefore produces compassion, facilitates also the realization of character and opinions, and therefore produces charity. The great majority of uncharitable judgments in the world may be traced to a deficiency of imagination. The chief cause of sectarian animosity is, the incapacity of most men to conceive hostile systems in the light in which they appear to their adherents, and to enter into the enthusiasm they inspire. The acquisition of this power of intellectual sympathy is a common accompaniment of a large and cultivated mind, and, wherever it exists, it assuages the rancor of controversy. The severity of our judgment of criminals is also usually excessive, because the imagination finds it more easy to realize an action than a state of mind. Any one can conceive a fit of drunkenness or a deed of violence, but few persons, who are by nature very sober or very calm, can conceive the natural disposition that predisposes to it. A good man, brought up among all the associations of virtue, reads of some horrible crime, his imagination exhausts itself in depicting its circumstances, and he then estimates the guilt of the criminal, by asking himself, "How guilty should I be, were I to perpetrate such an act?"

To realize with any adequacy the force of a passion we have never experienced, to conceive a type of character radically different from our own, above all, to form any just appreciation of the lawlessness and obtuseness of moral temperament, inevitably generated by a vicious education, requires a power of imagination which is among the rarest of human endowments. Even in judging our own conduct, this feebleness of imagination is sometimes shown, and an old man, recalling the foolish actions, but having lost the power of realizing the feelings, of his youth, may be very unjust to his own past. That which makes it so difficult for a man of strong vicious passions to unbosom himself to a naturally virtuous man, is not so much the virtue as the ignorance of the latter. It is the conviction that he cannot possibly understand the force of a passion he has never felt. That which alone renders tolerable to the mind the thought of judgment by an all-pure Being, is the union of the attribute of omniscience with that of purity, for perfect knowledge implies a perfect power of realization. The further our analysis extends, and the more our realizing faculties are cultivated, the more sensible we become of the influence of circumstances both upon character and upon opinions, and of the exaggerations of our first estimates of moral inequalities. Strong antipathies are thus gradually softened down. Men gain much in charity, but they lose something in zeal.

We may push, I think, this vein of thought one step further. Our imagination, which governs our affections, is in its earlier and feebler stages wholly unable to grasp ideas, except in a personified and concrete form, and the power of rising to abstractions is one of the best measures of intellectual progress. The beginning of writing is the hieroglyphic or symbolical picture, the beginning of worship is fetishism or idolatry, the beginning of eloquence is pictorial, sensuous, and metaphorical, the beginning of philosophy is the myth. The im-

agination in its first stages concentrates itself on individuals; gradually, by an effort of abstraction, it rises to an institution or well-defined organization; it is only at a very advanced stage that it can grasp a moral or intellectual principle. Loyalty, patriotism, and attachment to a cosmopolitan cause are therefore three forms of moral enthusiasm respectively appropriate to three successive stages of mental progress, and they have, I think, a certain analogy to idolatrous worship, church feeling, and moral culture, which are the central ideas of three stages of religious history.

## THE SCIENCE OF GOING UP-STAIRS.

EVERY one knows that the ascent of a staircase is more fatiguing than ordinary walking; but current ideas upon the subject, as upon most other familiar things, are loose and inaccurate, and therefore unsuited to regulate practice. Science gives us more precise information about it, which it is important for all to understand.

The planet on which we live, although itself an example of motion on a stupendous scale, seems to be unwilling that any thing else should stir. It puts forth an influence called gravity, which would hold every one of us fast in our places like a vice, if some other agency did not come to set us free. It is a star more than ninety millions of miles away that, liberating us from the chain of gravity, makes it possible to change places. To move a body upon the earth's surface, a counter-force must be exerted sufficient to overcome the pull of gravity, and this counter-force is solar energy. In railway locomotion, as is well known, the sun's force, stored up in fuel, is set free by combustion, and converted into a rolling movement through the agency of cranks and wheels. The animal system works on the same general principle, but by different mechanical arrangements. In walking, the solar force stored up in food is liberated in the system and translated into mechanical movement through the agency of contractile muscles and bony levers.

In walking, progression is effected by a succession of lifts, inclinations, and swings. In starting, the body is lifted (for example) by the levers of the right foot, and is inclined forward. The left foot being then raised from the ground, the leg swings forward and is carried by its momentum beyond the right foot. The levers of the left foot now lift the body again, and the right leg swings forward, and so we oscillate along on a pair of pendulums. As walking thus takes place by the pendulous movement, its economy is involved in the law of oscillation. We walk with the least expenditure of power when the intervals of the steps are so timed that each leg swings by its own weight through its natural arc, and there is no extra effort either to quicken or retard the swinging movement. Short pendulums vibrate more quickly than long ones, and therefore short-legged people step quicker than long-legged people, though with no more sense of exertion.

In going up-stairs, the mechanism of progression is, of course, the same; but the lifting action, which is the real force-consuming part of the process, is now greatly increased. Instead of being just sufficient to admit of the free swing of the pendulous foot, it must be so great as to project the body up at each step a distance equal to the height of the stair. Whether a man of one hundred and forty pounds gets his weight up-stairs by the levers that Nature gave him, or lifts it by a pulley, makes no difference; one hundred and forty pounds are to be lifted through the height of the staircase, at any rate. In walking a distance of eighteen feet, at, say, six steps, and assuming that the centre of gravity of the body is raised an inch at each step, the total effort expended would be equal to raising the body through a height of six inches. But, in ascending a staircase eighteen feet high, the body has to be lifted through thirty-six times this space, with the expenditure of thirty-six times the amount of force; the power expended would therefore be equal to a level walk of three hundred and twenty-four feet. We thus get a definite idea of the immensely greater con-

umption of force in ascending a staircase than in ordinary walking.

But the difference is still greater than here appears. We have said that each person has a natural time-rate of stepping, at which force is expended most economically. Two persons of unequal steps will move along together at equal speed, the short and frequent stepping of one being equal to the longer and slower stepping of the other. But, if they join arms, and undertake to "keep step," one or the other must violate the law of oscillation—that is, must swing his pendulums in the wrong time. He therefore walks at a mechanical disadvantage which involves extra exertion, and to that degree a waste of force. But in going up-stairs this deviation from the natural movement and the consequent mechanical drawback are very much greater; so that, besides the enormous draft of vital energy for simple lifting, there is a further loss in the disadvantageous way of doing it.

But there is another law of the case which is still more important. In moving a body from one point to another, it is not enough to know how much force is required to overcome weight and friction, but *the time in which it is to be done* must also be taken into account; and, as regards the economy of force, this is by far the most serious thing. The dynamic formula is, not that the moving force must equal the weight of the mass moved, but it must equal the mass *multiplied into the velocity*. And how multiplied? People generally would say that, if the speed be doubled, the force also must be doubled; but this is far from the truth. You cannot double the speed by doubling the force; to double the speed you must double the force *twice*. A duplicate increase of velocity requires a quadruple increase of force. If a railway-train is moving at ten miles an hour, to make it twenty miles an hour requires four times the driving power—hence the great economy of low speed. Physicists assure us that, in raising weights by pulleys or levers, the same principle holds. When, therefore, you run up-stairs in half the time that you would walk up, the draft upon the vital energy is multiplied *fourfold*. Quickening the speed lengthens the staircase; and quickening it a little lengthens it a great deal. Running up in half the time is equivalent to walking up *four flights*.

Running up-stairs is thus an excessive strain upon the constitution; but where does this strain fall? The levers of motion are moved immediately by the muscles; but the muscles cannot act of themselves. Their contractions and relaxations take place only under stimulus; they are all connected by lines of force, called nerves, with the nervous centres, and these are the sources of muscular stimulation. Not that the nerve-force of the brain is converted into the mechanical movement of progression, but nerve-force is constantly drawn upon to maintain the action of the muscles, and this draft is always greatest where there is a sense of exertion. The feelings are muscular stimuli, and whenever excited they press for vent in muscular movement; if much excited, for example, we cannot sit still. Under the influence of an intense emotion, as terror, for instance, men often put forth an amount of power which would be impossible under ordinary circumstances. In running up-stairs, therefore, it is not mere mechanical force that we are expending; there is a wasteful exertion of the highest force of the organism. It takes place at the expense of nervous vitality and cerebral vigor. There is a limited fund of nervous power which is drawn upon by the stomach in digestion, by the heart in circulation, by the glands in secretion, by the muscles in work, and by the organ of mind in feeling and thinking. And this fund of force being limited, any over-draft in one direction takes place at the expense of the others. When bodily vigor is high, the evil result of running up-stairs may not be decidedly felt; but where there is debility of any of the processes, this strain cannot fail to tell in some form or other with injurious effect.

The habit of running up-stairs implies bad calculation. The reason offered in nine cases out of ten will be, that it is to save

time. But time must be very precious when we can afford to pay for it in vital energy at such an exorbitant rate. It is better to be deliberate, to take time and economize vital power. It may answer for young people, in their exuberance of activity, to make the staircase a gymnasium; but it is a wasteful folly in others, who, if time must be saved by accelerated motion, had better do it by adopting the trot as the regular pace of the parlor.

The bad practice is, however, in reality, due to incorrect thinking upon the subject. People suppose that, in going up-stairs, there is just so much to be done *at any rate*, and the quicker the task is over with the better. But this is a fallacy, and when we undertake to reduce fallacies to practice, we always have to pay the penalty.

## TABLE-TALK.

LANDSCAPE painting has, for a long time, held a pre-eminent place in American art. Almost without historical painting, as it is commonly understood, and, in *genre* painting, singularly inferior to the French artists, we may, in landscape, with good reason, champion the painters of the world. Landscape painting has been, with our artists, more ambitious than it has been elsewhere; they have treated it more largely and with greater daring; they have rendered it epic in character; it has become heroic, as it were, in pictures like the "Andes" and "Icebergs" of Church, and the Rocky Mountain views of Bierstadt. The largeness, richness, and beauty of our scenery have filled and inspired the hearts of our painters. The spirit of our woods controls our studios, for our life has too little of the picturesque in its contrasts; our history is too little suited in its adjuncts and conditions for the canvas, to animate or create painters of incident and character. Our landscape painters have been close students of Nature; they have rarely made theories or schools; they have sought to express, with simplicity and truth, the charms and beauties of hills and woods, mountains and meadows, sea and lakes, flowers and grasses; to express the gentleness and delicacy of Nature, as well as her grandeur and greatness.

In an earlier number of the JOURNAL we presented our readers with a steel engraving, from a painting by KENSETT, called "Noon on the Sea-shore"—a picture peculiarly characteristic of this painter, who delights in painting summer seas, and waves rippling softly over sandy bars. The present number is accompanied by an engraving, by Mr. A. F. BELLOW, called "The River Road." Mr. Bellows has peculiar sympathy for picturesque inland views, such as abound in our New England and Northern States, and usually paints homely, rural characters in his pictures, as if he would give them thereby a more vivid human interest. These two engravings are only part of a series that it is our design to offer to the readers of this journal, in which we hope to include specimens of all the leading American painters. We have already in preparation plates from pictures by CHURCH, CASILEAR, DURAND, JAMES HART, HASLITINE, SUYDAM, FENN, and others. The collection, in due time, will become not only a varied series of illustrations of our mountain, river, and coast scenery, but a choice gallery of American art.

Mr. Booth, having terminated a long run of "Romeo and Juliet" at his new theatre, has produced "Othello," appearing in his own person as the Moor. This is the fourth Shakespearean revival of the season, and, while scarcely better than the others in pictorial setting, is, to our mind, much the best acted. We have heretofore been more familiar with Mr. Booth as Iago than as Othello, and hence this performance is new to many of us. Mr. Booth's rank as an actor has always been a disputed point, and we confess to have been among those to question his genius. But his *Othello* is a performance that in

some particulars deserves high praise. We think he is lacking in power in the stronger scenes; he has not the electrical flash, the powerful swell, the intense force of grand passion. But his Othello exhibits a more intellectual purpose, a juster conception, a more consistent unity, than we have seen in his other characters. In his hands, Othello is one "not easily jealous, but, being wrought, perplexed in the extreme." The confident assurance of the devoted husband, as Iago first intimates his suspicions; the dawn of the dreadful thought, repressed as soon as conceived; then its return, and the gradual creeping into his heart of the full conviction of Desdemona's guilt, were all illustrated and depicted with a skill that would be difficult to excel. Mr. Booth was fortunate in an excellent Iago, Mr. Adams. The mounting of the play, its scenery, accessories, and costuming, are so far perfect and admirable, that the drama is rendered a vivid historical picture. There is a felicity in all the appointments of the plays at Mr. Booth's Theatre, so marked that it amounts to genius.

Buckle's "History of Civilization," although a work of great originality and learning, the influence of which has been powerfully felt in the world of thought, is nevertheless notoriously a work of many and grave faults. One of these is the denial of the progressive nature of the moral element in man. In his theory of the advance of civilization the intellect only is held to be progressive, while the moral faculties remain stationary. Mr. W. E. H. Lecky, a young man who has recently conquered a position in philosophic literature by the authorship of the "History of the Rise and Influence of Rationalism in Europe," is generally understood to be a close student of Buckle, and sympathetic with many of his views. But he has just completed a remarkable work on morals, in which he takes a view diametrically opposite to that of his predecessor. It is a "History of Morals from the Time of Augustus to that of Charlemagne." The opening chapter, on "The Natural History of Morals," is a very lucid and interesting analysis and historical review of the rival intuitive and utilitarian systems, and their relations to different phases of philosophical speculation and the different states of society. He here takes the ground that morals are progressive, and we publish in the present number of the JOURNAL a suggestive extract from the advance sheets of the work, in which he shows the intimate dependence of progressive morality upon the development of the imagination. Mr. Lecky's work, besides presenting a new and original statement, and abounding in fresh and impressive views, is written with a warmth of feeling and a rhetorical elegance which contrast strongly with the dull didactic tone by which treatises upon this subject are usually marked.

The spring exhibition of the Academy of Design, which opened about the middle of April, is a very good one, although there are more famous names absent from its catalogue than present. We find nothing upon the walls from either Church, Bierstadt, James Hart, Cropsey, Gifford, or McEntee. The venerable Durand has outdone himself in an unusually ambitious picture, called "A Mountain Forest," in which we find those same careful tree-studies for which our veteran landscapist is so famous. Mr. Durand's energy and skill are unimpaired by age; he even attempts larger subjects than he did in his youth. This picture of "A Mountain Forest," and one, painted about three years ago, of "The Catskills," are superb contributions of his matured skill to a public that should never let his memory die. Mr. Kensett has two pictures in the collection—one of "Lake George;" the other, one of his characteristic coast scenes. If Kensett has painted any subject too frequently, it is undoubtedly Lake George. His coast scenes, it is true, are also numerous, but there is a delicious charm, in their wide and dreamy horizons, that asserts its spell with renewed force, let them come as often as they will. Our present brief paragraph

is no more than to chronicle the opening of the exhibition, and to note its three or four leading paintings. Among these we may mention two companion pictures by Mr. Huntington—one called "Sowing the Word;" the other, "Science and Christian Art." Both of these are mediæval in character and time, and each is particularly noticeable for its delicious ideals of womanly beauty. One represents an old man reading a missal to two young women; the other portrays an aged sage bending over an open volume of some occult science, while a young girl shows to him a picture of the Holy Family, in the early, rude style of Italian art. The motive of either painting is slight enough, and the story easily told; but, as ideal portraits, they have a supreme charm. In warmth of tone, in delicacy, in ripe conception of character and of beauty, they lead all the pictures of their class in the collection. Mr. Eastman Johnson is present in a sort of family group, which gives little token of the skill that, a few years ago, made his paintings the great talked-of; Mr. Hennessey, Mr. Homer, Mr. La Farge, have each a peculiar and characteristic canvas; and there is the usual array of portraits, many of them excellent, by Mr. Page, Mr. Baker, Mr. Hicks, and others.

### Foreign Literary and Personal Notes.

IN his great work on the History of Morals, soon to be republished in this country, Mr. W. E. H. Lecky has the following interesting observations on the influence of journalism upon thought in England: "A most momentous intellectual revolution is at present taking place in England. The ascendancy in literary and philosophical questions which belonged to the writers of books, is manifestly passing, in a very great degree, to weekly and even daily papers, which have long been supreme in politics, and have begun, within the last ten years, systematically to treat ethical and philosophical questions. From their immense circulation, their incontestable ability, and the power they possess of continually reiterating their distinctive doctrines; from the impatience, too, of long and elaborate writings, which newspapers generate in the public, it has come to pass that these periodicals exercise probably a greater influence than any other productions of the day, in forming the ways of thinking of ordinary educated Englishmen. The many consequences, good and evil, of this change it will be the duty of future literary historians to trace, but there is one which is, I think, much felt in the sphere of ethics. An important effect of these journals has been to evoke a very large amount of literary talent in the lawyer class. Men whose professional duties would render it impossible for them to write long books, are quite capable of treating philosophical subjects in the form of short essays, and have, in fact, become the chief writers in these periodicals. There has never, I think, before, been a time when lawyers occupied such an important literary position as at present, or when legal ways of thinking had so great an influence over English philosophy; and this fact has been eminently favorable to the progress of utilitarianism."

With us a new play, by a native author, is almost unknown. One's memory can scarcely extend back to such an event. What few new dramas are offered to us come solely from English or French sources, and many even successful foreign productions are never reproduced on the American stage. In New York, we have had, during the present season, but one new play, unless we count a few worthless burlesques and extravaganzas, which are new only in name, and the sole interest of which exists in the opportunity they afford for dancing, singing, and the display of legs. In London there seems to be as much activity among the dramatists as here there is idleness. In one night recently, for instance, there were produced, for the first time, a new play, called "Black and White," by Mr. Wilkie Collins and Mr. Fechter; another called "Minnie; or, Leonard's Love," by Mr. Henry J. Byron; still another, by Mr. Tom Taylor, entitled "Won by a Head;" then a burlesque, by Mr. Brough, called "Joan of Aro;" a melodrama, rejoicing in the name of "Light in the Dark; or, Life Underground;" and, lastly, a dramatic version of Victor Hugo's "Les Misérables," with the title of "The Man of Two Lives"—all these new plays in one single night. But this was on Easter-Monday, an occasion, in London, for the revival of festivities of all kinds.

Five of the German princes are writers of ability. King John of Saxony has few equals in German literature in translating Italian and English poets. King Louis II. of Bavaria, besides being an art-critic of no mean merit, is also a poet. Prince George of Prussia has written two tragedies, which will find a permanent place in the dramatic

ature of his country. The Duke hereditary of Saxe-Meiningen, a son of eighteen, has recently completed a tragedy, entitled "The Emperor Henry V.," which he submitted to the managers of the Royal Theatre of Berlin, and which they found so excellent that they accepted it immediately, and will have it performed in the course of a few months. Finally, the Grand-duke of Oldenburg is a clever writer on literary affairs, and has prepared a work on the campaign of 1866, which will shortly be published in Berlin.

The last dramatic sensation, in Paris, is M. Victorien Sardou's new play "Patrie!"—printed, as we give it, with a note of admiration. This drama is in a very different direction from M. Sardou's previous plays. It is historical in scene, melodramatic in incident, and tragical in catastrophe. The action of the piece takes place in the days when the power of the Duke of Alva, in the Netherlands, was at its height; and the plot turns upon a conspiracy against this dark, unscrupulous tyrant. The construction of the play is very novel, and the audiences, that nightly assemble at the Porte St. Martin to listen to it, are intensely absorbed in the varying fortunes of its characters. This play, we understand, will shortly be produced at the Grand Opera-House, in New York.

Michaud, the publisher of the French "Biographie Universelle," paid to authors, from 1811 to 1829, when the great Cyclopædia was completed, four hundred thousand francs for their contributions. Brockhaus, the Leipzig publisher, paid six thousand dollars for the articles in the first edition of his "Conversations-Lexikon." Pierer, of Altenburg, paid about seven thousand dollars to the writers of his "Encyclopædie." The subsequent editions of the "Conversations-Lexikon" and "Encyclopædia" cost even less, so far as literary compensation is concerned.

General von Roon, the distinguished regenerator of the Prussian army, and without whose eminent services the wonderful triumphs of the Prussian war of 1866 could hardly have been achieved, is the author of a very popular series of school geographies, on which he has been receiving large copyrights for many years past. General von Roon is a pupil of Ritter, the celebrated Prussian *avant*.

The two most prominent candidates for the Spanish throne, the Duke of Montpensier and ex-King Ferdinand of Portugal, are writers of considerable ability. The Duke de Montpensier has written several volumes of historical sketches, and published a few essays in the *Revue de Deux Mondes* and the *Journal des Débats*, under various *noms de plume*. Ferdinand, the ex-King of Portugal, has translated Goethe's "Faust" and Shakespeare's "Hamlet" into Portuguese. He is an excellent linguist, and a gentleman of the highest culture.

Strasser, the Austrian executioner, who died lately at Brünn, in Moravia, in his seventieth year, has left a volume of Memoirs, which is believed to contain matter of great interest. He it was who strangled the Hungarian generals who were ordered to be executed at Arad, in 1849, by order of the cowardly and bloodthirsty Haynau. He executed nearly two hundred persons in the course of his long and eventful life.

Dr. Brown-Séquard, of this country, who has achieved an eminent reputation for his knowledge and experience in various diseases, has accepted the chair of Comparative and Experimental Pathology in the School of Medicine, Paris. The Government has decided to build a *laboratoire* for him in the garden of the *Hôpital des Cliniques*, and he expects to enter upon the full duties of his position next November.

The King of Prussia, having heard that Gustave Freytag, the distinguished German novelist, and author of "Debit and Credit," "The Lost Manuscript," and other standard romances, was desirous of visiting the United States, offered to intrust him with a special diplomatic mission to Washington, an offer which Mr. Freytag declined.

The anonymous author of the "Golden Patti Book," which appeared some time ago in Paris, and which, on account of the extraordinary enthusiasm with which it celebrated the merits of the little American cantripe, excited some attention, it has now been ascertained, was written by no other than her present husband, the Marquis de Caux.

Eugene Sue's posthumous novel, "Camilla; or, the Mysteries of the Heart," which has recently been published in Paris, is not considered here by any means equal to the productions by which he obtained his fame.

In the year 1862, Prince Napoleon resolved to write a history of his great uncle, Napoleon I., and had already completed several chapters of the first volume, when his cousin, the emperor, heard of it, and urged him to abandon the idea. He had considerable difficulty in dissuading his cousin from his purpose.

Will it be believed? In no country is the retail book-trade more

profitable, and are authors more liberally compensated, than in Russia. If Hans Christian Andersen were a Russian, his "Fairy Tales" would have long since made him a rich man.

Emile de Girardin, the great Parisian editor, they say, thinks he is a by far better dramatist than journalist. At any rate he would willingly give a great part of his editorial fame for the satisfaction of getting one of his plays just once enthusiastically applauded at the Théâtre Français.

The advance orders received by the German publishers of Victor Hugo's "L'Homme qui rit" exceed very considerably those which they received for their edition of "Les Misérables."

Alexandre Dumas, Jr., says that he would never have thought of writing so many books and plays on the subject of the *demi-monde*, had not his mother, a very bright and thoughtful woman, urged him to do so.

Adolphe Thiers has dictated all his works, and never written a single line of them, nor ever looked at one of the proof-sheets. His old private secretary is a man of considerable literary ability, on whom M. Thiers can perfectly rely.

The sale of the first volume of Heseckiel's "Bismarck Book," which appeared in November, in Germany, has been larger than that of any popular German work on history or biography published since 1851.

In the year 1844 Count von Bismarck translated the first six books of the "Æneid" into blank verse. He has recently been urged to publish the work, and is likely to do so next fall.

Rossini's favorite book was "Gil Blas." He had in his small but select library fifteen beautifully illustrated French and Italian editions of that work.

The town of Certe, in France, with thirty thousand inhabitants, has not a single newspaper of any kind. In America, a town of this size would have half a dozen, at least.

Easter Day was celebrated at Madrid by the administration of the communion to about fifty Spanish Protestants. Such an occurrence has not taken place in Spain since the time of Philip II.

General Wilson's "Life and Letters of Fitz-Greene Halleck" has been translated into modern Greek by Professor George D. Canale, and is announced for publication at Athens, Greece.

Saint-Beuve, the French author and academician, has been dropped from the lists of guests that are regularly invited to the court-balls and to the Monday soirées of the Empress Eugénie.

The wife of Proudhon, the famous French writer on political economy, is living in destitute circumstances in one of the suburbs of Paris.

Frederick Gerstäcker, the German traveller and novelist, has declined the position of private secretary offered him by Dom Pedro of Brazil.

## The Museum.

ARCHIMEDES, of Syracuse, declared that, if they would give him a fulcrum and a sufficiently long lever, he would move the world, but, not knowing its weight, as we do now, he could not have formed a very clear idea of the magnitude of the task. Supposing that he got his lever planted, and of sufficient length to be moved by exerting upon it a pulling force of thirty pounds. Had he moved it through ten thousand feet per hour for ten hours a day, the remote end of the lever would have to pass through an arc which it would take 8 trillions, 774 billions, 994 millions, 574 thousands, 737 of centuries to accomplish, in order to raise the earth a single inch.

The vessels of the fleet of Columbus which first crossed the Atlantic, were all of small size, probably of not more than one hundred tons' burden each, and therefore not larger than the American yachts, whose ocean-race from New York to Cowes was regarded as an example of immense hardihood, even in 1867.

Among the many strange and curious preparations of the remains of our fellow-creatures I do not think that there are any more remarkable than the dried heads of the Indians of Ecuador. By the great kindness of Mr. Jamrach, dealer in animals, I am now enabled to give a drawing of one of these most interesting preparations. It consists of a human head which has by some process or other been shrunk to about the size of a large orange. The features are perfect, the eyes are closed, and the eyebrows still remain. The lips are slightly parted, and threads of colored cotton

have been introduced through both lips, arranged so as to form a pendulous tassel. The face is painted with streaks of red, giving a savage and ferocious appearance. The hair springs in its natural form from the forehead. It is parted down the middle, and then falls gracefully backward, as seen

in the engraving. This hair is of a raven-black color, very thick, and with a much higher gloss upon it than any human hair I have ever seen in the shops of London dealers. The total length of this hair is twenty eight and a half inches. The measurements of the head are as follows: From the roots of hair on forehead to nose, two inches; nose to chin, two inches; from ear to ear (measuring across the nose), five inches; width of mouth, one and a half inches; length of ear, one inch. Mr. Berjeau, the artist has, at my suggestion, drawn a carpenter's rule by the

side of the head, in order to give an idea of the proportionate size of the most interesting preparation.

There can be no doubt whatever but that this is really the skin of a hair of a human being. The head is perfectly hollow, and the skin as hard and about the thickness of thick pasteboard; the skull is entirely absent. No seams are perceptible in the features, although it may be discovered with the finger in the thick skin which carries the hair. The story is that the whole skin of the head is present, and it is simply shrunk to its present size by some process unknown to English medical men. The only way that I can imagine it to have been prepared—and I have experience in matters of this kind—is that a process of slow and careful drying by hot sand was adopted; but still fancy this process would have impaired the permanent beauty of the hair. I can, however, I confess, hardly bring myself to believe but that a great deal of dexterity and ingenious manipulation has been employed in a manner which I cannot here describe.

In the Exhibition of 1861 there was a head of this kind, of which I have a photograph; the owner asked me a fabulous price for it. About a year since, I examined another of these heads, the property of a friend kindly submitted for my examination by my next-door neighbor, A. Ricci, Esq.; and I believe Mr. Bartlett lately had one in his possession for a short time.

I have no history whatever of these variable and rare heads, and am in ignorance as to whether they are made simply as objects of curiosity for sale—as memorials of deceased friends—as trophies of war—or as objects connected in some way with religious worship. I should feel very grateful if any of our correspondents could give me information on the above points.—*Frank Buckland.*

## PARFUMERIE RIGAUD & CIE., PARIS.

It is respectfully announced to the world of fashion and elegance, that RIGAUD & CIE., of Paris, are the only importers and manufacturers, in Europe, of the genuine YLANG-YLANG, and that the Soaps, Pomades, Oil, Cosmetics, Face and Toilet Powders, also the perfumes for the handkerchief,

### EXTRACT OF YLANG-YLANG,

### AND MANILLA BOUQUET,

Are only genuine when signed thus,

Or bearing our Trade Mark,

A BRANCH OF  
YLANG-YLANG.

*Rigaud & Cie.*

### ASK FOR RIGAUD'S PERFUMERY.

Sold only by first-class Druggists and Fancy Goods Dealers throughout the United States and other parts of the world.

SPECIAL REPRESENTATIVE,

CLIFFORD J. BALLYN,  
53 Murray St., New York.

EDITIONS IN BOTH FRENCH AND ENGLISH.

WILL BE PUBLISHED APRIL 24th,

## SEA AND NIGHT;

BEING PART FIRST OF

VICTOR HUGO'S NEW NOVEL,

ENTITLED

### The Man who Laughs; or, by the King's Command.

In one volume, octavo. Paper cover. Price, 50 cents.

VICTOR HUGO's remarkable novel, now publishing in APPLETONS' JOURNAL, will appear in several parts. The first part, under the sub-title of "Sea and Night," completed in the fifth number of the JOURNAL, will be issued on the day announced above. The remaining parts will be printed in book form as rapidly as completed in the JOURNAL.

ON APRIL 24th, IN FRENCH,

LA MER ET LA NUIT,

PREMIERE PARTIE.

## L'HOMME QUI RIT,

PAR VICTOR HUGO.

Un volume, broché. Prix, 50 cents.

The French edition of Victor Hugo's novel corresponds in size with the English edition, and will be sold at the same price.

Orders solicited from the Trade.

# THE MAN WHO LAUGHS; OR, BY THE KING'S COMMAND. BY VICTOR HUGO.

IV.

MAGISTER ELEGANTIARUM.

JOSIANE had a tedious time of it, this need scarcely be said. Lord David Dirry-Moir held a high position in the gay life of London. Nobility and gentry paid him reverence. Let us record one triumph of Lord David—he dared to wear his own hair.

The reaction against the wig had begun. Just as in 1824, Eugene Deveria was the first who ventured to let his beard grow, in 1702 Price Devereux was the first who ventured, under the pretext of the frizzle of the literati, to risk in public his own hair. To risk his hair was almost to risk his head. The indignation was universal, although Price Devereux was Viscount Hereford, Peer of England. He was insulted; and indeed the thing was worth the penalty. At the very height of the outcry, Lord David appeared, all at once, also with his own hair and without a wig. Such things portended an end of society. Lord David was derided even more than Viscount Hereford. He stuck to it. Price Devereux had been the first, Lord David Dirry-Moir was the second. It is sometimes more embarrassing to be the second, than the first. It demands less genius, but more courage. The first, intoxicated with the novelty, may be ignorant of the danger; the second sees the abyss, and throws himself into it. Lord David Dirry-Moir threw himself into this abyss of not wearing the wig. At a later day they imitated him; they had, after these two revolutionists, the audacity to dress the hair; and powder came as an extenuating circumstance.

To establish, in passing, this important historical point, let us say that the rightful priority in the war upon the wigs belongs to a queen—Christine of Sweden, who wore men's apparel, and showed herself in 1680 with her natural chestnut hair, powdered and bristling up without aid of hair-dresser, and cut close to the head. She had likewise "some sprigs of beard," says Misson.

The Pope on his part, by his bull of March, 1794, had thrown a slur on the wig, in taking it from the heads of his bishops

and priests, and in ordering the men of the church to let their hair grow.

Lord David then did not wear a wig, and did wear calf-skin boots.

These mighty deeds pointed him out for public admiration.

There was not a club of which he was not the leader, not a boxing-match in which he was not wanted as referee. The referee decides every thing.

He had drawn up the code of rules of many of the clubs of high life; he had laid the foundations of refined resorts, of which one, the Lady Guinea, still flourished in Pall Mall, in 1772. The Lady Guinea was a club thronged by all the younger members of the nobility. They gambled there. The smallest stake was a rouleau of fifty guineas, and there was never less than twenty thousand guineas on the table. At the elbow of each player stood a little table for the cup of tea, and the ormolu bowl wherein was kept the rouleaux of guineas. The players wore leather cuffs, such as servants wear in sharpening knives, to protect their laces, leather doublets to protect their ruffs, and on the head, to shelter the eyes, because of the glare of the lamps, and to keep their locks smooth, large straw hats covered with flowers. They were masked, that they might not betray their agitation, especially at the game of quinzé. All wore their cloaks thrown backward over their shoulders, for luck. Lord David was a member of the Beefsteak Club, the Surly Club, the Split-Farthing Club, the Fantasticals Club, the Scratch-Penny Club, the Sealed Knot, a royalist Club, and to the Martinus Scriblerus, founded by Swift, in place of the Rota founded by Milton.

Though a handsome man, he belonged to the Ugly Club. This club was dedicated to deformity. They there incurred the obligation to fight, not for a pretty woman, but for an ugly man. The hall of the club was ornamented with portraits of hideous people. Thersites, Triboulet, Duns, Hudibras, Scarron; over the mantel was Æsop, between two one-eyed men, Cocles and Camoens; Cocles being one-eyed of the right eye, and Camoens of the left, each was sculptured on his blind side, and the two blind profiles were set opposite each other. The day that the pretty Madame Visart took the small-pox, the Ugly Club toasted her. This club yet flourished at the opening of the nineteenth century; it had sent a diploma of honorary membership to Mirabeau.

Since the restoration of Charles II., the revolutionary clubs had been abolished. They had pulled down, in a little street adjoining Moorfields, the tavern wherein were held the sittings of the Calf's-Head Club, so called because on the 30th of January, 1648, the day when the blood of Charles I. flowed upon

\* Entered, according to Act of Congress, in the year 1869, by D. APPLETON & CO., in the Clerk's Office of the District Court of the United States for the Southern District of New York.

the scaffold, they had drunk from a calf's skull a bumper of red wine to the health of Cromwell.

To the republican had succeeded the monarchical clubs. They amused themselves decently therein.

There was the She-Romps Club. They caught in the street a woman, a passer-by, of the middle class, as young and as good-looking as they could get; they pushed her by force into the club, and there made her walk on her hands, her feet in the air, her face hidden by her drooping petticoats. If she took it in dudgeon, they lashed a little with the riding-whip that part which was not concealed. 'Twas her fault. The squires of this order of horse-breaking called themselves "The Friskers."

There was the Sheet-Lightning Club, metaphorically the Merry-Dancers. Negroes and whites danced here the *picanter* and the *timtirimbás* of Peru, notably the Mozamala, the doxy's dance which has its crowning feature in the dancing-girl's sitting down on a heap of meal, upon which, on rising, she leaves the imprint of the Callipyge. We may apply to this spectacle the verse of Lucretius—

*Tunc Venus in sylvis jungebat corpora amanti.*

There was the Hell-Fire Club, where they played at being impious. It was a tournament of sacrilege. Hell was here set up at auction to the most blasphemous.

There was the Butting Club, so called because they gave butts to people. They picked out some porter, with an immense brisket and an idiotic look. They offered him, and if necessary they forced him to take, a pot of porter for allowing them to give him four butts in the breast, and thereupon they laid their wagers. Once, a man, a heavy brute of a Welshman, named Gogangerdd, died at the third butt. This looked serious. There was an inquest, and the jury brought in the verdict—"died of expansion of the heart, caused by excessive drinking." Gogangerdd had indeed drunk a pot of porter.

There was the Fun Club. Fun is, like cant, like humor, an exceptional, untranslatable word. Fun is to farce what allspice is to salt. To enter a dwelling, smash the costly mirrors, slash the family portraits, poison the dog, put the cat in the aviary, this was called "cutting out a piece of fun." To spread a false report of bad news which should put people needlessly in mourning, this was fun. It was fun that had cut a square hole in the Holbein at Hampton Court. Fun would have been proud; if it had broken off the arms of the Venus of Milo. Under James II. a young lord, a millionaire, who had set fire at night to a straw-thatched cottage, filled London with laughter and was proclaimed *King of Fun*. The poor devils of the straw-thatched cottage escaped in their night-dresses. The members of the Fun Club, all of the highest aristocracy, wandered about London at an hour when the citizens were asleep, took the shutters off their hinges, cut the pipes of the hydrants, caused the cisterns to cave in, took down the signs, laid waste the flower-beds, extinguished the street lamps, sawed asunder the main props of houses, broke the squares of glass in the windows—especially in the quarters of the poor. It was the rich who thus treated the wretched. That was why no complaint was possible. Besides, there was something comic in it. These manners have not yet wholly disappeared. In different parts of England and of the English possessions, at Guernsey for example, from time to time they lay waste your house a little at night, break down your fence, wrench off your door-knocker, etc. If the offenders were poor, they would be sent to jail; but they are estimable young gentlemen.

The most distinguished of the clubs was presided over by an emperor, who carried a crescent on his forehead, and was called "the Great Mohock." The Mohock surpassed the Fun. To do harm for harm's sake, such was the programme. The Mohock Club had this noble aim: to be mischievous. For fulfilling this duty, all means were good. On becoming a Mohock, you were bound by oath to do mischief. To do mischief at all hazards—no matter when, no matter what, no matter how—was the obligation. Every member of the Mohock Club was expected

to have his special talent. One was a "dancing-master," that is to say, he made clodpools frisk about, by pricking their calves with his sword. Others were skilled in "sweating," that is to say, the getting up a circle of six or eight gentlemen, rapier in hand, around some low scamp; being surrounded on all sides, it was impossible that the scamp should not turn his back upon some one of the party; the gentleman, upon whom he turned it, chastised him for it by a pointed thrust that made him wheel about; a fresh thrust in the back intimated to the fellow that he had some sprig of nobility behind him; and thus, one after another, each pricking in his turn. When the man, girt in by this circle of swords, and all bloody, had sufficiently pirouetted and danced, they had him cudgelled by their lackeys, just to change the course of his ideas. Others "stirred up the lion," that is to say, laughingly arrested a passer-by, crushed his nose for him with the blow of a fist, and plunged their two thumbs into his two eyes. If the two eyes were put out, they paid him for the loss.

Such, at the beginning of the eighteenth century, were the pastimes of the opulent idlers of London. The idlers of Paris had others. Monsieur de Charolais fired off his gun at a citizen on the threshold of his own door. In every age, youth has amused itself.

Lord David Dirry-Moir carried into these divers institutions of pleasure his sumptuous and liberal turn of mind. Like any other of his set, he would gayly burn down a thatched wooden hut, and singe a little those who were within it; but then he rebuilt their cottage for them in stone. It happened once, at the She-Romps Club, that he made a couple of women dance upon their hands. One was a girl; he gave her a dowry. The other was married; he had her husband made a chaplain.

Cock-fights were indebted to him for a commendable perfection. It was a marvel to see Lord David dressing a cock for the pit. Cocks seize hold of feathers, as men do of hair. Thus Lord David made his bird as bald as possible. With scissors he cut off all the feathers of the tail, and from head to shoulder all the feathers of the neck.—So much the less for the enemy's beak, said he. Then he stretched out his cock's wings, and trimmed to a point each separate feather, one after the other, thus garnishing his wings with pikes.—That's for the enemy's eyes, said he. In the next place, he scraped the claws with a penknife, sharpened the nails, set into the main spur a steel blade, sharp-pointed and cutting, spat over his head, spat over his neck, anointed him with saliva, as they used to rub the athletes with oil, and let him go, terribly got up, with the exclamation:—That's how a cock is made into an eagle, and how a barn-yard fowl becomes a creature of the mountain!

Lord David attended boxing-matches, and was, in fact, their living ordinance. On great occasions, he it was who looked to the planting of the stakes and the stretching of the cords, and who determined how many yards there should be in the square bit of fighting-ground. When he acted as second, he followed his man foot to foot, a bottle in one hand and a sponge in the other; called to him, "Strike fair!" suggested feints to him; advised him when fighting; wiped him when bleeding; picked him up when knocked down; took him on his knees; put the neck of the bottle between his teeth; and, from his own mouth, filled with water, blew a fine rain into his eyes and ears, which tends to reanimate the dying. When he was umpire, he looked well to the fairness of the blows; forbade any one, be he who he might, except the seconds, assisting the combatants; declared the champion beaten who did not place himself right opposite his adversary; watched that the interval between the rounds did not exceed half a minute; hindered stumbling from unevenness of the ground; decided against him who butted with his head; prevented a man, who had fallen down, being struck. All this science did not make a pedant of him, and in no degree diminished his hold upon the people around.

It was not when he was the referee in a fight, that the sun-burnt, pimpled, and shaggy backers of this side or that would

venture—for the purpose of helping their failing man, or of upsetting the chances of a bet—to climb over the palisade, to enter within the enclosure, to break down the cords, to pull up the stakes, or to interfere violently with the fight. Lord David belonged to the small number of umpires, whom they did not dare to pommel.

Nobody trained as he did. The pugilist, whose trainer he consented to be, was sure to win. Lord David picked out a Hercules, massive as a rock, tall as a tower, and made of him his own child. The problem was to convert this human rock, from the defensive, into the offensive condition. Therein he excelled. Once the Cyclops adopted, he never let him go. He became a wet-nurse. He measured his wine; he weighed his meat; he counted his hours of sleep. It was he who invented that admirable *régime* for a boxer, which has been revived by Moreley: in the morning, a raw egg and a glass of sherry; at noon, a leg of mutton underdone, with tea; at four o'clock, toasted bread and tea; in the evening pale ale and toasted bread. After which he undressed the man, shampooed him, and put him to bed. In the street, he did not lose sight of his man, keeping all dangers out of his way, runaway horses, carriage-wheels, drunken soldiers, pretty girls. He had an eye upon his virtue. This maternal solicitude brought out continually some new gain in the pupil's education. He taught him the blow with the fist that smashes the teeth, and the blow with the thumb that knocks out an eye. Nothing could be more touching.

He prepared himself, in this fashion, for the political life, to which he must be summoned at a later period. It is no slight affair to become an accomplished gentleman.

Lord David Dirry-Moir had a passionate fondness for out-of-door exhibitions, mountebanks on show, the circus with its rare beasts, the acrobats' stage, scaramouch, jesters, farces in the open air, and all the wonders of fairs. The real lord is he who has a smack of the people's man; and this is why Lord David frequented the taverns and the obscure court-yards of London and the Cinque Ports. So as to be able, without compromising his rank in the White Squadron, to collar a top-man or a caulker, he put on a sailor's jacket when he went into these low haunts. For these transformations it was convenient for him that he did not wear a peruke, for, even under Louis XIV., the people stuck to their hair as the lion to his mane. In this style, he was free. The common people, whom Lord David encountered in these gatherings and with whom he associated, held him in high esteem, and did not know that he was a lord. They called him Tom Jim-Jack. Under this name he was popular, and a great personage in this low debauchery. His descent to their standard was masterly. On occasion, he used his fists. This side of his refined life was known to, and greatly appreciated by, Lady Josiane.

## V.

## QUEEN ANNE.

## I.

ABOVE this couple, there was Anne, the Queen of England.

Hand in glove with any one was Queen Anne. She was gay, kindly, almost august. No one of her good qualities reached up to Victoria; none of her imperfections descended to depravity. Her embonpoint was puffy; her humor was easy; her kindness was ill-timed. She was tenacious and yielding. As a wife, she was unfaithful and faithful, having favorites to whom she gave up her heart, and a consort for whom she reserved her couch. As a Christian, she was a heretic and a bigot. She had one beauty, the full neck of a Niobe. The rest of her person was nothing to boast of. She was awkwardly coquettish, and honestly. Her skin was white and fine; she showed much of it. From her came the fashion of a collar of large pearls fitted close to the neck. She had a narrow forehead, sensual lips, fleshy cheeks, a protruding eye, short sight. Her short-sightedness extended to her wits. Apart from an occasional outburst of joviality almost as oppressive as her

anger, she lived in a sort of taciturn grumbling, and of silence in the dumps. Words escaped her, the meaning of which was only to be guessed. She was a compound of good woman and mischievous devil. She liked surprises, which is thoroughly womanish. Anne was a specimen, hardly rough-hewn, of the universal Eve. To this rough draught had fallen the chance of a throne. She drank. Her husband was a Dane, thorough-bred.

Tory, she governed by the Whigs, femininely, insanely. She had fits of rage. She would break things. No person more maladroit in handling affairs of state. She let events slip through her fingers. All her policy was cracked. She excelled in bringing about great catastrophes from little causes. When moved by a freak of authority, she used the term "hitting with the poker."

She uttered, with an air of profound revery, such phrases as this: "No peer can be covered before the king, except Courcy, Baron Kinsale, peer of Ireland." She said: "It would be unjust not to have my husband Lord Admiral, as my father was." And she made George of Denmark High-Admiral of England, and "of all her Majesty's Plantations." She was in a perpetual perspiration of peevishness. She did not express her thoughts; she exuded them. In this goose there was something of the sphinx. She had no aversion to fun, to the farce that is biting and offensive. If she could have made Apollo hump-backed, it would have been her delight. But she would have left him a god. Her ideal of benignity was, not to drive any one to desperation, while wearying all the world. She had many a crabbed word, and for little more would have sworn, like Elizabeth. From time to time she took from the man's pocket attached to her petticoat a small round box in *repoussé* silver, on the lid of which was her portrait in profile between the two letters Q. A. (Queen Anne); opened it, and with the tip of her finger extracted from it a small quantity of pomatum, with which she reddened her lips. Then, having prepared her mouth, she laughed. She was excessively fond of the flat ginger-bread nuts from Zealand. She was proud of being fat.

More a Puritan than any thing else, she would none the less willingly have addicted herself to plays. She had a fancy for an Academy of Music, copied from that of France. In 1700, a Frenchman named Forteroche desired to construct in Paris a Royal Circus, at a cost of four hundred thousand livres, to which scheme D'Argenson was opposed. This Forteroche passed over into England, and proposed to Queen Anne, who was for a moment captivated by the idea, to build in London a theatre fitted with machinery, that should be finer than the French King's, and have a fourth story underground. Like Louis XIV., she liked her carriage to go at a gallop. Teams of horses and relays sometimes made the journey from Windsor to London in less than an hour and a quarter.

## II.

IN the time of Anne, there could be no assemblage of people without permission from two justices of the peace. A dozen persons gathering together, were it to eat oysters and drink porter, was a felony.

Under this reign, nevertheless comparatively a moderate one, the press-gang for the fleet operated with extreme violence: gloomy proof that the Englishman is more of a subject than of a citizen. For centuries the King of England made use therein of a despotic procedure, that gave the lie to all the old charters of freedom, and in her exemption from which France in particular triumphed and was indignant. What takes off a little from the triumph is, that, in unison with the press for seamen in England, there was in France the press for soldiers. In all the large French towns, every able-bodied man, passing along the streets to his business, was liable to be forced by the crimps into a house called a *four*. There he was shut up pell-mell with others. Those, who were fit for service, were picked out; and the recruiters sold these passers-by to officers. In 1695, there were thirty of these *fours* in Paris.

The laws concerning Ireland, emanating from Queen Anne, were atrocious.

Anne was born in 1664, two years before the Fire of London; whereupon the astrologers (there were some still, as witness Louis XIV., who came into the world under the auspices of an astrologer, and swaddled in a horoscope) had predicted that, being the elder sister of the deceased, she would be Queen. She was so, thanks to astrology, and to the Revolution of 1668. She felt humiliated at having only had Gilbert, Archbishop of Canterbury, for her sponsor. To be god-daughter of the Pope was no longer possible in England. A simple primate is a mediocre god-father. Anne had to be contented with one. It was her own fault. Why was she a Protestant?

Denmark had endowed her virginity—*virginitas empta*, as say the old letters patent—with a dowry of six thousand two hundred and fifty pounds sterling per annum, secured on the bailiwick of Wardinbourg, and the island of Fehmarn.

Anne followed, without conditions and by mere routine, the traditions of William. The English, under this royalty born of a revolution, had just so much liberty as could be secured, between the Tower of London wherein they clapped the orator, and the pillory wherein they clapped the writer. Anne spoke Danish a little for her asides with her husband, and French a little for her asides with Bolingbroke. Pure gibberish the latter; but it was, especially at court, the grand English manner of speaking French. There was not a *bon-mot*, save in French.

Anne paid great attention to moneys, particularly to the coinage in copper, which is of low value and popular; she desired to cut a grand figure therein. Six farthings were struck under her reign. On the reverse of the first three, she had simply a throne engraved; on the reverse of the fourth, she desired to have a triumphal car; and on the reverse of the sixth, a goddess holding a sword in one hand and an olive-branch in the other, with the motto *Bello et Pace*. Daughter of James II., who was simple-minded and fierce, she was brutal.

And, at the same time, she was gentle at heart. A contradiction which is only one in appearance. A fit of anger metamorphosed her. Heat up sugar; it will boil.

Anne was popular. England loves female sovereigns. Wherefore? France excludes them. That is one reason already. Perhaps, after all, there is no other. For English historians, Elizabeth stands for greatness, Anne for goodness. As you please. Be it so. But there is nothing delicate in these feminine reigns. The lines are heavily drawn. It is gross greatness and gross goodness. As for their immaculate virtue, whereto England clings, we have nothing to say against it. Elizabeth is a virgin tempered by Essex, and Anne is a spouse complicated with Bolingbroke.

### III.

ONE idiotic habit that peoples have, is attributing to the king what they do themselves. They fight. Whose is the glory? The king's. They pay. Whose the magnificence? The king's. And the peoples like to be rich in this fashion. The king receives from the poor a crown-piece, and renders back to the poor a farthing. How generous he is! The colossal pedestal looks up to the pigmy superstructure. How tall the manikin is! He is on my back. A dwarf has an excellent mode of being higher than a giant; it is to perch himself upon the other's shoulders. But that the giant should let him do it, there's the odd part of it; and that he should admire the baseness of the dwarf, there's the stupidity. Human ingenuousness!

The equestrian statue, reserved for kings alone, is an excellent type of royalty; the horse is the people. Only, the horse transfigures himself by degrees. At the beginning, he is an ass; at the end, he is a lion. Then he throws his rider to the ground, and we have 1642 in England, and 1789 in France; and sometimes he devours him, in which case we have in England 1649, and in France 1793.

That the lion can again become a jackass, this is surprising, but a fact. It was thus in England. The pack-saddle of royalist idolatry was once more put on. Queen Anne, as we have remarked, was popular. What did she to this end? Nothing. Nothing—this is all that is asked of England's sovereign. He receives, for this nothing at all, thirty millions of francs a year. In 1705, England, that had only thirteen vessels-of-war under Elizabeth, and thirty-six under James I., could count a hundred and fifty of them. The English had three armies: five thousand men in Catalonia, ten thousand in Portugal, fifty thousand in Flanders, besides which they paid forty millions per annum to monarchical and diplomatic Europe, a sort of woman of the town whom the English people have always had in keeping. The Parliament having voted a loan of thirty-four millions in contingent annuities, there was crowding at the Exchequer to subscribe to it. England was sending a squadron to the East Indies, and a squadron to the coasts of Spain under Admiral Leake, without reckoning a reserve of four hundred sail under Admiral Shovel. England had just amalgamated Scotland with herself. It was the period between Hochstet and Ramillies, and one of these victories seemed to foreshadow the other. England, in drawing that net at Hochstet, had made prisoners of twenty-seven battalions and four regiments of dragoons, and had taken away a hundred leagues of country from France, falling back, undone, from the Danube to the Rhine. England was stretching a hand to Sardinia and the Balearic Islands. She was bringing in triumph into her ports ten Spanish ships-of-the-line, and many a galleon freighted with gold. Hudson's Bay and Straits were already half-surrendered by Louis XIV.; it was supposed that he was about to give up also Acadia, St. Christopher, and Newfoundland, and that it would be a bit of too much good luck if England still left to Cape Breton the King of France fishing for cod. England was about to impose upon him the shame of demolishing himself the fortifications of Dunkirk. In the mean time, she had taken Gibraltar, and was taking Barcelona. How many great things accomplished! How can one help admiring Queen Anne, who took the trouble to live in those days?

From a certain point of view, Anne's reign seems to be a reaction from the reign of Louis XIV. Anne, for a moment parallel with that monarch in the conjuncture that is called history, bears to him a vague reflected resemblance. Like him, she figures in a grand reign. She has her monuments, her arts, her victories, her captains, her men of letters, her chest for pensioning celebrities, her gallery of masterpieces side by side with her own majesty. Her court also assumes in regard to her the form of a procession, and has its triumphal aspects, its order, its march. It is a miniature copy of all the great men of Versailles, already none too great. The still-life deception is there; let *God save the Queen!* be added, which might then have been borrowed from Lulli, and the whole picture becomes an illusion. Not a personage is wanting. Christopher Wren is a very passable Mansard; Somers is the equal of Lamoignon. Anne has a Racine who is Dryden, a Boileau who is Pope, a Colbert who is Godolphin, a Louvois who is Pembroke, and a Turenne who is Marlborough—though you must increase the size of the wigs and diminish that of the foreheads. Altogether, it is solemn and pompous; and Windsor, at that epoch, might have looked like a sham Marly. Every thing, however, is feminine; and the Father Tellier of Anne is called Sarah Jennings. For the rest, a dawning of their irony—which, fifty years later, will be philosophy—outlines itself in literature, and the Protestant Tartufe is unmasked by Swift, just as the Catholic Tartufe had been denounced by Molière. Notwithstanding also that, at this period, England quarrels with and defeats France, she imitates her and profits by her enlightenment; it is French light that shines upon the forehead of England. It is a pity that Anne's reign should have lasted only a dozen years; otherwise the English might easily have been persuaded to speak of the age of Anne as we speak of the age of Louis

XIV. Anne comes to the front in 1702, when Louis XIV. is declining. It is one of the curiosities of history, that the rising of this pale star coincides with the setting of that star of purple, and that, at the instant when France had her King Sun, England should have had her Queen Moon.

Another point to be noted. Louis XIV., though they were at war with him, was greatly admired in England. "He is the king that France wants," said the English. The Englishman's love for his liberty is mixed up with a certain recognition of another man's servitude. This kindly feeling toward the chains that bind a neighbor is pushed sometimes even to enthusiasm on behalf of a despot close at hand.

To sum up: Anne made her people "happy," as has been said thrice over, and with a gracious persistence, on pages six and nine of his dedication, and page three of his preface, by the French translator of Beeverel.

#### IV.

QUEEN ANNE had a slight grudge against the Duchess Josiane, for two reasons.

In the first place, because she found the Duchess Josiane pretty.

Secondly, because she found the Duchess Josiane's betrothed husband handsome.

Two grounds for jealousy suffice for a woman; one alone is enough for a Queen.

Let us add this. She bore her malice, for being her sister.

Anne did not approve of women being pretty. She considered it detrimental to morality.

As for herself, she was ugly.

Not from preference, however.

A part of her religion grew out of this ugliness.

Josiane, beautiful and philosophic, troubled the Queen.

For an ugly Queen, a pretty Duchess is not an agreeable sister.

There was another grievance, the *improper* origin of Josiane.

Anne was the daughter of Anne Hyde, simply a lady, legitimately, but unfortunately, espoused by James II., when he was Duke of York. Anne having some of this inferior blood in her veins, felt as though she were only half royal; Josiane, brought into the world altogether irregularly, made more conspicuous the mischance—less in itself, but real—of the Queen's birth. The offspring of a misalliance saw without pleasure, not far from herself, the offspring of bastardy. There was herein a disobliging resemblance. Josiane had the right to say to Anne: "My mother is just as good as yours." At court this was not said; but, evidently, it was thought. It was annoying for the royal majesty. Why this Josiane? How came she to think of being born? Of what use is a Josiane? Certain relationships are belittling.

Nevertheless, Anne bore herself pleasantly toward Josiane.

Perhaps she might have loved her, if they had not been sisters.

#### VI.

##### BARKILPHEDRO.

It is useful to know what people are about, and it is wise to keep an eye on them to some extent.

Josiane caused Lord David to be watched a little by a man of her own, in whom she had confidence, and whose name was Barkilphedro.

Lord David prudently caused Josiane to be observed by a man of his own, of whom he was sure, and whose name was Barkilphedro.

Queen Anne, for her part, secretly kept herself informed of the acts and movements of the Duchess Josiane, her bastard sister, and of Lord David, her future brother-in-law in a left-handed way, by a man of her own, on whom she could fully rely, and whose name was Barkilphedro.

This Barkilphedro had his fingers on these keys, Josiane,

Lord David, the Queen. One man between two women! What modulations were possible! What an amalgamation of souls!

Barkilphedro had not always occupied this splendid position for whispering into three ears.

He was an old servant of the Duke of York. He had aimed at being a man of the church, but had failed. The Duke of York, a Prince in England and in Rome, made up of kingly Popery and legal Anglicanism, had his Catholic household, and his Protestant household, and might have promoted Barkilphedro in the one or the other hierarchy, but that he did not think him Catholic enough for an almoner or Protestant enough for a chaplain. So that Barkilphedro found himself, between these two religions, with his soul on the floor.

This is not a bad position for certain souls of a reptile nature.

There are some roads that can only be travelled, crawling on the belly.

An obscure, but nutritious, domestic service was for some time the sole subsistence of Barkilphedro. Service is something, but he wanted power in addition. He was about to reach it, possibly, when James II. fell. All had to be begun over again. There was nothing to be done under William III., an awkward fellow, who had in his style of reigning a prudery which he mistook for integrity. Barkilphedro, his patron James having been dethroned, did not, all at once, come to rags. A certain something, that survives fallen monarchs, nourishes and sustains for a while their parasites. The remainder of the exhaustible sap keeps alive, for two or three days, at the ends of the limbs, the leaves of the uprooted tree; then suddenly the leaf grows yellow and dries up, and so does the courtier.

Thanks to that embalming called legitimacy, the prince himself, though fallen and cast quite away, holds on and maintains himself; it is not the same thing with the courtier, who is far more dead than the king. The king down there is a mummy; the courtier up here is a phantom. It is an extreme emaciation, to be the shadow of a shade. Accordingly, Barkilphedro became a starveling. Then he adopted the literary profession.

But he was driven out even of the kitchens. Sometimes he did not know where he should sleep. "Who shall take me from this sleeping out of doors?" said he. And he struggled on. All that is touching in patience under adversity he exhibited. He had, moreover, the talent of the little insect tree-borer, that knows how to bore upward from below. In profiting by the name of James II., his memories, his constancy, his kindness of heart, etc., he had bored his way up to the Duchess Josiane.

Josiane took a liking to this man of wretchedness and wit, two things that moved her. She presented him to Lord Dirry-Moir, gave him lodgings in the servants' quarters, attached him to her household, was kind to him, and sometimes even spoke to him. Barkilphedro was no longer cold or hungry. Josiane thee'd and thou'd him. It was the fashion for great ladies to thee and thou literary men, who permitted it. The Marquise de Mailly received, lying in bed, Roy whom she had never seen, and said to him—"It is thou that hast written *L'Année Galante*? Good-morning." At a later period the men of letters returned the theeing and thoning. The day came when Fabre d'Eglantine said to the Duchess de Rohan:

"Art thou not La Chabot?"

As for Barkilphedro, to be thee'd and thou'd was a triumph. He was intoxicated by it. He had aspired to this contemptuous familiarity.

—Lady Josiane thees and thons me! said he to himself. And he rubbed his hands together.

He took advantage of this theeing and thoning to gain ground. He became a sort of familiar in the private apartments of Josiane, never annoying her, quite unperceived; the duchess would almost have changed her chemise before him.

All this, however, was mere business. Barkilphedro had aimed at position. A duchess was a halfway point. The summer-gallery that did not lead to the queen as a piece of work, was a failure.

One day Barkilphedro said to Josiane:

— Would your Grace make my fortune?

— What dost thou wish? asked Josiane.

— Employment.

— Employment! for thee!

— Yes, Madam.

— What an idea that thou shouldst ask for employment!

Thou art good for nothing.

— It is for that reason that I ask for it.

Josiane laughed.

— Of all the occupations for which thou art not fit, which dost thou desire?

— That of uncorker of the bottles of the Ocean.

Josiane laughed the louder.

— What is that? Thou art quizzing me.

— No, Madam.

— I will amuse myself with answering thee seriously, said the duchess. What dost thou wish to be? Say it again.

— Uncorker of the bottles of the Ocean.

— All is possible at court. Is there such an office as that?

— Yes, Madam.

— Teach me something new. Go on.

— There is such an office.

— Swear it to me upon the soul that thou hast not.

— I swear it.

— I don't believe thee.

— Thanks, Madam.

— Then thou wouldst—? Begin over again.

— Unseal the bottles of the sea.

— That is an office which ought not to fatigue thee. It is like currycombing the Bronze Horse.

— Almost.

— Nothing to do. It is indeed a place that suits thee. Thou art fit for that.

— You see that I am fit for something.

— Ah! there, thou art making fun. There is really such an office?

Barkilphedro assumed an attitude of the most respectful gravity.

— Madam, you have an august father, James II., King, and an illustrious brother-in-law George of Denmark, Duke of Cumberland. Your father has been, and your brother-in-law is, Lord High Admiral of England.

— Are these the novelties that thou wast going to teach me? I know all this quite as well as thyself.

— But here is something your Grace does not know. There are in the sea three kinds of things—those which are at the bottom *Derelict*, those which float on the water *Flotsam*, and those which the waves cast upon the land, *Jetsam*.

— What else?

— These three things, *Derelict*, *Flotsam*, and *Jetsam*, belong to the Lord High Admiral.

— What else?

— Your Grace understands?

— Not a bit of it.

— All that is in the sea, that it swallows up, that floats upon it, and that it throws upon the strand, all belongs to the Admiral of England.

— All. Very well. Go on.

— Except the sturgeon, which belongs to the king.

— I should have thought, said Josiane, that all this belonged to Neptune.

— Neptune is an idiot. He has lost it all. He has let England take the whole of it.

— Finish thy recital.

— Prizes of the sea is the name given to these things picked up.

— Be it so.

— The store is inexhaustible. There is always something floating about, something cast ashore. This is the contribution of the sea. The sea pays tribute to England.

— I gladly consent. But conclude.

— Your Grace understands that this habit of the Ocean has created a bureau.

— Where is it?

— At the Admiralty.

— What bureau?

— The bureau of the prizes of the sea.

— Very well.

— The bureau is divided into three offices, *Derelict*, *Flotsam*, *Jetsam*; and for each office there is an office-holder.

— And then—

— A ship in the open sea would communicate something to the land—that it is sailing in such a latitude, that it has just encountered a marine monster, that it is in sight of a coast, that it is in distress, that it is going to capsize, that it is a total loss, et cetera; the captain takes a bottle, puts inside the scrap of paper on which he has written what he had to say, seals it up, and throws the bottle into the sea. If the bottle goes to the bottom, this concerns officer *Derelict*; if it floats, this concerns officer *Flotsam*; if it is carried ashore by the waves, this concerns officer *Jetsam*.

— And thou wouldst be officer *Jetsam*?

— Exactly.

— And this is what thou callest being uncorker of the bottles of the Ocean?

— Because there is such an office.

— Why dost thou desire this place more than the other two?

— Because it is vacant at this moment.

— In what consist its duties?

— Madam, in 1598, a bottle tarred over, which had been found by a conger-eel fisherman, in the quicksands of the strand of Epidium Promontorium, was carried to Queen Elizabeth; and a parchment which was drawn from the bottle gave information to England that Holland had taken possession, without saying any thing about it, of an unknown country, *Nova Zembla*; that this occupation had occurred in June, 1596; that in this country the discoverers had been devoured by the bears; and that their manner of passing the winter had been written down on a paper enclosed in a musket-case, hanging up in a chimney of the wooden building erected, and left on the island by the Hollanders, who were all dead; and that this chimney was made of a cask with the heads knocked out, built in the roof.

— I understand but little of thy rignarole.

— Be it so. Elizabeth understood it. One country more for Holland was one country less for England. That a bottle had imparted the information, was thought a very important matter. And from that day the order was issued, that whoever should find a sealed bottle on the sea-shore should carry it to the Admiral of England, under pain of the gallows. The admiral detailed an officer for opening these bottles, who communicated their contents to her Majesty, when there was occasion for it.

— Do these bottles often come to the Admiralty?

— Rarely. But this is of no moment. The office exists. It has assigned to it a chamber and lodging at the Admiralty.

— And this way of doing nothing, what do they pay for it?

— A hundred guineas a year.

— And thou annoyest me for that?

— It is the means of living.

— Like a beggar.

— In a manner becoming to people of my class.

— A hundred guineas, it is a mere puff!

— What supports you for a minute supports us for a year, us fellows. This is the advantage of being poor.

— Thou shalt have the place. Eight days afterward, thanks to the good-will of Josiane, thanks to the position of Lord David Dirry-Moir, Barkilphedro, saved henceforth, rescued from the precarious, placing his foot upon solid ground, lodged, his expenses paid, salaried with a hundred guineas a year, was installed at the Admiralty.

## VII.

## BARKILPHEDRO SHOWN UP.

THERE is one thing that never fails—that is ingratitude.

Barkilphedro was not wanting herein.

Having received so many acts of kindness from Lady Josiane, naturally he had but one thought—that of avenging himself for them.

Let us add that Josiane was pretty, great, young, rich, powerful, illustrious; and that Barkilphedro was ugly, squat, old, poor, dependent, obscure. It was matter of urgent necessity, that he should avenge himself for that also.

When one's whole being is darkness, how shall one pardon such brilliancy of light?

Barkilphedro had but one thing in his favor, a big belly.

A big belly is accepted as the sign of a benevolent disposition. But the belly aggravated Barkilphedro's hypocrisy. For this man was a sad reprobate.

What was Barkilphedro's age? Any. The age necessary for the matter in hand. He was old in wrinkles and gray hair, and young in elasticity of mind. He was alert and heavy, a monkeyish hippopotamus. Royalist, certainly; republican, who knows? Catholic, perhaps; Protestant, beyond a doubt. For the Stuarts, probably; for the house of Brunswick, undeniably. To be *for* avails nothing, unless at the same time one may be *against*. Barkilphedro practised this wisdom.

The office of "uncorker of the bottles of the Ocean" was not so absurd as Barkilphedro had seemed to make it out. The reclamations, which to-day we should call declamations, of Garcie-Ferrandez in his *Ocean Chart* against the spoliation of stranded vessels, called the *Right of Wreck*, and against the pillage of waifs by the people of the coast, had made a sensation in England, and had brought about this improvement for the shipwrecked—that their goods, chattels, and effects, instead of being stolen by the country-folk, were confiscated by the Lord Admiral.

All the rubbish cast up by the sea on the English coast, merchandise, hulls of ships, bales, boxes, etc., belonged to the Lord Admiral; but, and herein came to light the importance of the position sought by Barkilphedro, the floating bottles containing messages or other information attracted the particular attention of the Admiralty. Shipwrecks constituted one of the grave concerns of England. Navigation being its life, shipwreck was its peculiar care. The English waters were in a constant state of disquietude. The little glass bottle thrown to the waves from a foundering vessel bore a supreme token, precious in every point of view. Token of the ship, token of the crew, token of the spot, the hour and the manner of the shipwreck, token of the winds that had buffeted the vessel, token of the currents that had borne the floating flask ashore. The office that Barkilphedro filled has been abolished more than a century; but it was really a useful one. The last incumbent was William Hussey, of Dodington in Lincolnshire. The man who held this office was a sort of reporter of the affairs of the sea. All the close and sealed-up vases, bottles, flasks, jars, thrown upon the English shore by the tide, were sent to him; he alone had the right to open them; he was the first to learn the secret they contained; he classified and labelled them in his registry; the phrase *to lodge a paper at the registry*, yet in use in the Channel Islands, has this derivation. Indeed, a precaution had been taken in the matter. No receptacle could be unsealed and

uncorked, except in presence of two sworn officials of the Admiralty bound to secrecy, who signed, jointly with the incumbent of the *Jetsam* office, the record of the opening. But these sworn officials being held to secrecy, it resulted that Barkilphedro had a certain discretionary latitude; it depended upon him, up to a certain point, whether a fact should be suppressed or brought to light.

The fragile waifs were far from being, as Barkilphedro had told Josiane, unfrequent and inconsiderable. Now they reached the land in good time, and again after some years. This depended on the winds and currents. This custom of throwing bottles to the waves, like that of votive pictures, has gone a little into disuse; but, in these religious days, all who were about to die freely transmitted in this manner their latest thought to God and man; and sometimes these missives of the deep abounded at the Admiralty. A parchment kept at the chateau of Audlyene (old spelling), and annotated by the Earl of Suffolk, High Treasurer of England under James I., states that, in the year 1615 alone, fifty-two tarred gourds, bladders, and the like, making mention of ships in disaster, had been reported and entered upon the register of the Lord Admiral.

Service at court is like a drop of oil that continually goes on spreading itself. Thus it is that the porter gets to be a chancellor, and the ostler gets to be Lord High Constable. The special officer, who filled the place sought for and obtained by Barkilphedro, had been habitually a confidential person. Elizabeth had so wished it. At court, confidence means intrigue, and intrigue means promotion. This functionary had ended in being a person of some consequence. He was a clerk, and took rank immediately after the two grooms of the Almoner. He had admission to the palace, although we should add that it was called the "humble entry," *humilis introitus*, and even to the bedchamber. For the usage had been that he should inform the royal person, when the thing was worth the trouble, of these picked-up objects, often very curious things, wills of dying people, farewells waved to one's native land, revelations of barratry and offences against maritime law, legacies to the Crown, etc.; so that he kept up a communication between his registry and the Court, and rendered, from time to time, an account to his Majesty of this unsealing of unlucky bottles. It was the dark bureau of the Ocean.

Elizabeth, who spoke Latin with facility, asked Tamfeld, of Coley in Berkshire, the *Jetsam* officer of his time, when he had brought to her one of these old papers cast up by the sea—*Quid mihi scribit Neptunus?* What does Neptune write to me?

The boring had at last been finished. The little tree-borer had succeeded. Barkilphedro approached the person of the Queen.

It was all he desired.

To make his fortune?

Not at all.

To pull down that of others.

Happiness far greater.

There is enjoyment in mischief.

It is not given to everybody to have a vague but implacable desire for mischief, and never to lose sight of it. Barkilphedro had this tenacity.

The idea held him with the grip of the bull-dog's mouth.

It gave him a sombre satisfaction at heart to feel himself relentless. Let him but have a victim in his fangs, or the certainty of doing evil in his heart, and he wanted nothing more.

He shivered contentedly, in the hope that other people were cold.

There is opulence in being wicked. Such a man, though we may think him poor, and he is so, indeed, has all his wealth in malignity, and likes it so. All is in the contentment one possesses. To do a bad turn—it is the same thing with doing

a good turn—is more than money. Hard on the sufferer, happy for the doer. Catesby, the accomplice of Guy Fawkes in the papist Gunpowder Plot, said: "Let me only see Parliament blow up, with its four feet in the air. I would not exchange that for a million sterling."

What was this Barkilphedro? All that was little and all that was terrible. An envious man.

Envy is always found at court.

Court abounds in sauce-boxes, in people out of work, in rich idlers famishing for gossip, in searchers for needles in haystacks, in dealers in wretchedness, in biters bit, in sprightly fools who have the talk of an envious man in request.

What a refreshing thing is the evil that one says of others!

Envy is good material for making a spy.

There is a subtle analogy between this natural passion, envy, and this social function of playing the spy. The spy conducts the sport on behalf of others, like the dog; the envious man hunts on his own account, like the cat.

"A ferocious myself is the substance of the envious man."

For his other qualities, Barkilphedro was prudent, secretive, adhesive. He held on to every thing, and busied himself with his hatred. An inordinate baseness implies an inordinate vanity. He was liked by those whom he amused, and hated by others; but he was conscious of being disdained by such as hated him, and scorned by such as liked him. He was under perfect self-control. All his antagonisms bubbled up noiselessly in his vengeful submission. He was indignant—as if scoundrels had that right! He was silently a prey to the furies. To swallow every thing was his talent. He had secret internal rages, frenzies of concealed passion, of dark and smothered flames, which no one perceived; his was a fiery soul that consumed its own smoke. The surface smiled. He was obliging, earnest, facile, good-tempered, complaisant. No matter to whom, no matter where, he bowed. He swayed to the ground at a puff of wind. What a source of fortune it is to have a reed for the spinal column!

These secretive and venomous creatures are not so rare as one might suppose. We live with them gliding about all around us. Why these hurtful beings? Baffling question! The dreamer is constantly propounding it to himself, and the thinker has never answered it. Hence the sad look of the philosopher, forever fixed on that mountain of shadows which is his destiny, and from the top of which the colossal spectre of evil lets fall handfuls of serpents upon the earth.

Barkilphedro had an obese body and a lean visage. His trunk was heavy, and his face bony. He had short, furrowed finger-nails, knotty fingers, flat thumbs, coarse hair, a considerable space from one temple to the other, and the forehead of a murderer, wide and low. His half-opened eye concealed the insignificance of his look, under bushy eyebrows. His nose, long, pointed, crooked, and flabby, extended nearly to his mouth. Barkilphedro, suitably dressed as a Roman emperor, would have slightly resembled Domitian. His rusty yellow countenance looked as if modelled of a viscous paste; his immobile cheeks resembled putty; he had all manner of ugly, furrowed wrinkles; his jaw was massive, his chin heavy, his ear vulgar. In repose, seen in profile, the upper lip was raised at an angle, so as to disclose two teeth. These teeth seemed to look at you. The teeth looked, even as the eye bit.

Patience, temperance, faith, reserve, moderation, suavity, diffidence, sweetness, polish, sobriety, chastity, finished and rounded off Barkilphedro. He calumniated these virtues in possessing them.

Barkilphedro very soon got a footing at court.

### VIII.

#### INFERI.

At court, you may gain a footing in two ways. In the clouds, you are august; in the wind, you have power.

In the former case, you hail from Olympus; in the second, from the wardrobe.

He who is of Olympus has only the thunderbolt; he who is of the wardrobe has the police.

The wardrobe contains all the instruments of authority, and sometimes—for it is traitorous—of vengeance. Nero happened to die in one. It, then, bears a less decent name.

As a general thing, it is not so tragic. It is there that Albéróni admires Vendôme. The wardrobe becomes readily a place of audience for loyal personages. It serves the purpose of the throne. Louis XIV. receives therein the Duchess of Burgundy; Philip V. therein is cheek by jowl with the queen. The priest penetrates there. The wardrobe is sometimes a branch establishment of the confessional.

This is why there are fortunes in low conditions at court. Nor are these the smallest.

If you would be great, under Louis XI., be Pierre de Rohan, Marshal of France; if you would have influence, be Oliver le Daim, barber. If, under Marie de Médicis, you would be glorious, be Sillery, chancellor; if you would be of importance, be La Hannou, chambermaid. If you would be illustrious under Louis XV., be Choiseul, minister; if you would be redoubtable, be Lebel, valet. Given Louis XIV., Bontemps who made his bed for him was more powerful than Louvois who made him his armies, and Turenne who made him his victories. Take away Father Joseph from Richelieu, and behold Richelieu almost empty. He has mystery on his side at least. His scarlet eminence is superb; his gray eminence is terrible. To be a worm—what force! All the Narvaez, blended with all the O'Donnells, do less work than one Sister Patrocinio.

For instance, the condition of this power is littleness. If you would remain strong, remain insignificant. Be nothing at all. The serpent, coiled up in repose, typifies at once the infinite and zero.

One of these reptile fortunes had fallen to the lot of Barkilphedro.

He had trailed himself just where he wished.

Flat creatures enter everywhere. Louis XIV. had bugs in his bed, and Jesuits in his political machine.

Of incompatibility, not a bit.

In this world every thing is pendulum. To gravitate is to oscillate. One pole must have the other. Francis I. must have Triboulet; Louis XV. must have Lebel. There exists a deep-rooted affinity between this extreme of height and this extreme of abasement.

It is the abasement that directs. Nothing is easier of comprehension. He who is below pulls the strings.

No position more convenient.

You are the eye, and you have the ear.

You are the eye of the government.

You have the ear of the king.

To have the king's ear, is to draw and undraw, at your own fancy, the bolt of the royal conscience, and to cram into this conscience just what you please. The king's mind is your cupboard. If you are a rag-gatherer, it is the basket at your back. The ear of kings does not belong to kings, which is the reason why, in short, these poor devils are but slightly responsible. He, who is not master of his thought, is not master of his action. A king—he obeys.

What?

Some wicked soul or other, that from outside buzzes in his ear. Rueful fly of perdition!

This buzzing exercises sway. A reign is a dictation.

The loud voice is the sovereign; the low voice is the sovereign's unction.

Those are the true historians, who, in a reign, can distinguish this low voice, and hear what it breathes into the loud voice.

## THE WOMAN OF BUSINESS.

A NOVEL.

BY THE AUTHOR OF "THE BACHELOR OF THE ALBANY."

## CHAPTER VI.—IMPOSITIONS AND EXACTIONS.

ALEXANDER was the very ambassador to send to a damsel in distress. He had spirits enough to cheer a bevy of ladies in tribulation. Though he had studied hard, there was no sign of the desk or a trait of bookishness about him; you might have fancied he was bred in a deer-forest, or brought up for a dragoon. He was too free from foppery to suggest the idea of a lady's man, but in competition for lady's favor he would have been a formidable antagonist to nine-tenths of the finest gentlemen in May Fair.

It need hardly be said that Miss Evelyn had interested, if not fascinated him, too, as well as Woodville; indeed much more, for Woodville was chiefly touched by her distress and filial affection, but Alexander was attracted also by the stronger traits of her character. Then, as he had none of his friend's oddities or weaknesses, her piercing eye had no terrors for him; he could meet undaunted the penetrating glances before which the sensitive Woodville quailed. She might look through and through him, if she thought it worth the trouble.

He certainly decided right when he decided to take the bull by the horns, and it had the advantage of making him doubly agreeable in the lady's eyes, for it saved her from the difficulty she really felt, daring as she was, about placing that big bundle of papers in his hands. It was lying on Mr. Evelyn's table, nicely tied up, when Alexander entered, and the red tape caught his eye immediately.

The first thing he did was to repeat the encouraging message which Woodville had given him, and Alexander's voice was as cheery as his countenance; his voice and smile together were like a merry marriage-bell on a bright May morning. In a moment he made Miss Evelyn feel that she had no reason to be so dejected as she visibly was.

"I have really been very uneasy," she said, "and I cannot tell you how deeply indebted I feel to your friend."

"He is very happy," said Alexander, with a little exaggeration, "to be able to be of any use to your father by remaining here; and not to be behind him, I hope, Miss Evelyn, you will believe that it will make me equally happy to be of any service in my power to him at Turin or elsewhere. I hope you will be perfectly frank with me."

Whether stars can sing or not, eyes can dance; at least, Miss Evelyn's certainly did at this cordial speech. At the same time she blushed slightly, hesitated a little, looked thoughtful, and smiled again brighter than ever before she answered.

"I will be frank with you, Mr. Alexander—so frank as even to confess, what, perhaps, I ought to be ashamed to confess, that I had intended to tax your kindness before you proffered it; but I do hope you will impute it all to my anxiety about my father, I am sure you will. I dare say you have observed how little fit he is for business, even when he is in health; his tastes don't lie in that way at all; business crushes him, and when there are papers to be read, and studied, and digested, they make him positively ill."

"I am not at all surprised at it," said Alexander; "a man with your father's tastes would digest the Bodleian library easier than those few documents which I see lying on the table."

"Those few documents!" cried Miss Evelyn, her eyes dancing again. "Oh, but I am so glad to hear you call them so, for they are the very papers I refer to; I was so afraid they would frighten you—they are not so few, I assure you, but, at all events, they are a mountain to my poor father."

"Can you give me a general idea of the nature of the mountain?" said Alexander.

"Well, indeed, I think I can; at least I will try."

Then she told him a short story of a matter which had long been in dispute between one of the Vaudois pastors and the Piedmontese Government about a site for a school; it had long been the subject of litigation, but, though the law was found to be in favor of the pastor, there were still difficulties with the Government. The English minister at Turin was as friendly as possible, but indeed she fancied he was not much more given to papers than her father; at least year after year had passed, and interview after interview, papers and letters always multiplying, and nothing was done. This year a fresh crop of documents had turned up, and Mr. Evelyn was to have another

interview with the envoy, about the result of which he was sanguine; but he no sooner resumed the study of the papers, to refresh his memory and put them in order, than he caught that provoking cold, and the case was in imminent danger of lying over for another twelve-month.

"But remember," she added, "you must see Mr. Eglamour, the minister, himself; it won't do to see any of the attachés; when once a thing gets into the chancery of a legation, there is an end of it."

"Or rather, perhaps, no end of it," said Alexander, "as in another Chancery with which I am better acquainted. Is the minister friendly?"

"Oh, yes, perfectly; and he is a cleverish man enough, only not paperish, any more than my father. He would rather read one of Mademoiselle Scuderi's folio romances than a protocol or a page of a blue-book."

"The matter ought not to be very unmanageable, as the legal obstacles have been got rid of."

"Do you know, Mr. Alexander, I often think it would be clear enough—only for the papers."

"That is highly probable," said Alexander, laughing.

"When do you go?"

"My calèche is at the door."

"This is parting very soon," she said, placing the documents in his hands; "but indeed we shall never forget your kindness. You will return here, I presume, to rejoin Mr. Woodville?"

"I wish I could promise myself that pleasure, but I doubt if it will be possible. My friend has arranged to meet me at Turin."

"Return if you can; if not, I must only trust that we may meet again. I have written a few letters for you to our friends in the Valleys; one is to the pastor of Bobbio, a fine old man, and a great friend of ours. I do hope you will go there, and, if you do, you will be sure to see a charming boy in whom we are greatly interested, an orphan, and namesake of the famous Arnaud, whom you heard my father speak of. He is a noble little fellow; and, if you see him, you won't forget to give him my love. Thank you, Mr. Alexander—thank you again and again."

She gave him her hand cordially, not the least sentimentally, and cordially, not sentimentally, Alexander returned its warm pressure. While her hand was still in his, though it was but for an instant, she looked thoughtful, as if she had something still to say, and scrupled to say it.

"Is there any thing, Miss Evelyn? Be frank with me to the last."

"I will," she replied, resolutely; "there is something else, but indeed it is not much. At one of the inns which you will probably stop at, my stupid maid left a little book behind her—you won't laugh at me?—an account-book, in green leather, labelled with the word Bobbio. Pray inquire for it, and send it to me by the post, if you find it."

They parted, to meet again, but not for a very long time, and under greatly altered circumstances.

Alexander returned to his own apartment to say adieu to Woodville.

"Good heavens!" cried the artist, with both arms raised, like Dominie Samson uttering his familiar exclamation, when he saw in one of his friend's hands the bundle of papers, while the other was full of letters.

"It out-herods Herod, does it not?" said Alexander, diverted beyond measure at his friend's horror. "But I'm off; take care of the old gentleman, study the young lady, find out all about them, and take the likeness for me, if not for yourself."

"Deuce take me, if I do," cried Woodville, knocking the table when his friend was gone. "I hope Miss Evelyn has found out by this time that it was well she had not the Leone d'Oro all to herself."

But his friend's composure was contagious, he got calmer presently. Poor Woodville, when his fits of irritability were over, was painfully conscious of his infirmity, and greatly envied Alexander that happier temperament of his which takes life, like a bride, for better, for worse, surmounts obstacles by facing them with a light heart, and on which responsibilities sit as lightly as on a railway director.

As he saw very little now of the lady—she spent so much of her time in her father's room—the artist's opportunities of studying her character were slight in proportion, and the little occurrences of the day seemed always to be throwing cross-lights upon it. One of these

incidents might easily have led to something unpleasant, if not an actual rupture, if, fortunately, Hannah had not acted the part of a buffer and borne the brunt of the collision.

The young lady, being very exact herself, had already been provoked by Woodville's medical directions, thinking them much too vague, but she had taken care not to let him see how his loose practice displeased her. The night, however, before the doctor came, Mr. Evelyn was to take a few drops of some sedative tincture or another to compose him to sleep, if sleep refused to come of itself. On this occasion Morpheus was obstinate and would not come, so Miss Evelyn sent her maid to Woodville's room to know how many drops were to be taken.

"Four or five, or six, according to circumstances," replied Woodville, through the door; for he was just stepping into bed. In a minute Hannah was back again. Her mistress begged to know how many drops exactly.

"Five, then," cried Woodville, impatiently, as he was in the act of putting his candle out; "five, in a glass of water."

He had scarcely laid his head on his pillow, when there was another tapping, to know what sort of glass he meant.

He now bounced out of bed, and it was only a wonder that in his excitement he did not open the door and complete his orders in his night-gear, but he had just calmness enough left to spare Hannah's bashfulness so severe a trial. His commotion was only apparent in the tone with which he answered—

"Five drops in a wine-glass of water. I hope you understand that?"

"Yes, sir, *now* I do," replied Hannah, as she ran away.

"Impertinent hussey!" he growled, as he groped his way back to bed, which, as usual, he did not effect without upsetting his table with the candlestick and every thing else that was on it. But it was with the mistress he was enraged, and he was profane enough to call her a pert minx and a presumptuous chit of a girl twenty times over before he fell asleep.

The next morning the young lady had the good feeling to apologize, but it was for her maid!

"What a cunning little thing you are!" thought Woodville; but he was not the less disarmed, and obliged to refrain from the rub he had resolved to give her.

Perhaps something in his face told her that he had been offended, for she quickly added:

"I know you take me, Mr. Woodville, for a very dry, precise, matter-of-fact, methodical sort of a person; and, indeed, perhaps I am; but my father is partly to blame, for he is just the reverse, he has not a notion of order or regularity; so I have to do all the precision, as Mrs. Thrale had to do all the politeness when she travelled with Dr. Johnson; and then, you must know, I was actually educated for an old maid, by a worthy aunt of mine, who was one herself, and nothing less than a piece of clock-work in petticoats. My father used to say that her heart was a pendulum, and he was sure, if her hands were measured, one would be found long and the other short, like the hands of a watch. It was the same excellent woman who taught me figures, the accomplishment you heard my father joking about the other night."

"And a very valuable one it is," said Woodville.

"It ought to be," she replied, "when it is the only accomplishment a poor girl has. But do you know, Mr. Woodville, I believe I have a grain of romance in me, after all."

"I am sure you have," said the artist, and he was really sincere in saying it.

"At least I have my dreams and fancies like other people, and I would be so glad to tell you one of them, if you will take me out on the water for an hour; my father is disposed to sleep, and I want a little fresh air."

"You do indeed," said Woodville, feelingly, for he saw she was looking pale and worn with the confinement and anxiety. "An hour on the water will do you good."

She ran away to put on her things, but ran back in a moment, and said, in her prettiest, winningest way—

"Would it be taxing you too much to ask you to make a sketch for me—ever so rough a one?"

It was not a very heavy taxation. Woodville promised to do his best, and went for his sketch-book while she was putting on her things, and in a few minutes they were paddling on the lake.

"You must know," said the lady, beginning the conversation, "I have a fancy of old standing, at least as old as my acquaintance with Orta; I might almost call it a plan. My fancy is, to build myself some day or another, when I get tired of the world, a cottage, or a *châlet*, or a house of some kind or other, on this dear little lake, and I want you to sketch the spot for me from the water, for I have actually made up my mind where it is to be."

The artist smiled, and Miss Evelyn directed the boatman to the proper point of view.

"Salvator himself could not have chosen better," said Woodville, when they reached it.

"And the view it commands is no less fine, I assure you; that is the great point."

Woodville did a thing of this kind rapidly. The sketch was made in twenty minutes, and he promised to put in the details and do the coloring before he left Orta.

"And pray consider for me," she said, "what sort of a house it ought to be, to suit the scenery."

"Does your romance really go to the length of a cottage?" said Woodville.

She laughed, and replied, "Well, indeed, perhaps it had better be a villa."

"I thought so," said the artist to himself, and then told her that he thought a villa would be the correct thing, as they were on the Italian side of the Alps.

Without his pencil he would have been badly off during the many solitary hours he had now on his hands. Notwithstanding his peevish vow, after finishing the sketch for Miss Evelyn and putting in the villa, he took her likeness, as his friend had requested.

As in the case of his wayside picture, it was not so much a sketch of what she then was, as of what he imagined she would be in the lapse of time sufficient to develop the opening girl into the full-blown woman. He speculated on the changes which ten or a dozen years would probably make; he made the nose more commanding, he rounded, solidified, and doubled the chin, he amplified the bust, and the result was a fair and portly lady, stately and independent rather than haughty, and fit to be the centre of life and activity to a goodly family or a large estate. The eyes were his great embarrassment, and if he could with propriety have made one sentimental and the other calculative he would have done it. As it was, he could only compromise between a sparkle of romance and a shrewd eye to the main chance. A touch here and a touch there made the poetical or the speculative expression alternately prevail. It was wonderful what changes of character Miss Evelyn's countenance underwent according to the artist's mood, often influenced by his last interview with her. In fact, the expression of the eyes was still unsettled when, to his inexpressible relief, the doctor from Milan came.

To increase his satisfaction, he found in him an old acquaintance, whom he had quite forgotten, of his medical-student days. They agreed to dine together, and Woodville had now the opportunity he so much desired of learning something of Mr. Evelyn's history.

## FOR RICHER—FOR POORER.

THE great Rumsey wedding had been followed by unlooked-for consequences. Who could have supposed that, in less than five years, the young gentleman and the young lady, who, on that occasion, figured as bridegroom and as bride, would have been striking about in deep waters, struggling for life! Why, it seemed as if the newspapers would never have done discussing the bridal gifts and festivities. They had a way of talking freely about such matters in the public prints in those days, but I cannot be persuaded that Jane really furnished the reporters with lists of the articles of her *trousseau*, or that she had an inventory taken of the presents sent to her from good friends, far and near. I knew it was a custom which prevailed quite extensively—somehow *every thing* got into the papers—but Miss Barnard was not a vulgar person, the love given her was more precious than gold and diamonds, and, I think, it must have pained her when *they* were brought forward so conspicuously in connection with the celebration of her marriage.

The day on which he married Jane Barnard was a great day to Philip Rumsey. She was the topmost spray of an old family tree which had been noted long for loftiness. That he, a poor artist, should have been encouraged, by any circumstances, to tell Jane that he loved her, would never cease to be a wonder to himself. But he was wishing heartily, within the five years spoken of, that he had never found the courage to tell it. It is often so with us; the good fortune which we would secure at the cost of life, proves, when we have it at a price somewhat less, more than we can manage, or make use of.

It was because his pictures did not sell, and he had counted on their selling. Philip had not failed to tell Jane, at the outset, that his fortune consisted in his canvas, paints, and brushes. She had thought, and said, that no better fortune was to be asked than lay in them. If such a one, and such another, received twenty thousand dollars for vastly inferior pictures, who would venture to say what *he* might not receive? Jane's courage and enthusiasm were the finest tribute Rumsey had ever received, and, while receiving it, he thought, with infinite scorn, on scrubby critics, and that Public, the patron who might interfere with his fate.

But, after a lapse of five disappointing years, the aspect of things had greatly changed.

As soon as it began to look as though Philip and Jane might depend on him to any serious degree, Mr. Barnard, the venerable father of Miss Jane, made it evident to the pair that such dependence was not to be thought of. And, to convince them of his earnestness, he shoved them off, by considerably lessening the allowance which hitherto he had granted them.

His manner of doing this made it very evident that he was disgusted with his son-in-law. Indeed, he said, in so many words, that if Philip was not able to support his wife, her father would take her home again; but, if he did so, it would be with the understanding that the separation between them was a final one.

It was at this crisis, as it might be called, when Jane had indignantly refused her father's offer, that her husband began to borrow money here and there, and to rejoice in the discovery that his credit was good. Thus, for a time, all went smoothly with them, and the wife, not knowing what good fortune had befallen them, satisfied that money was forthcoming when needed, talked about her husband, and thought about him, with the pride one feels in the success of the nearest and dearest. She especially experienced sensations of triumph when she spoke of Mr. Rumsey to her father, and quoted the opinions entertained by good authorities of his genius and skill. The old gentleman had never been a patron of art, and had no reply to make to this talk; the only thing that he could say to the purpose was, that, if Rumsey could support his family by his profession, it would be a fortunate thing for them all around.

For a year after Philip had made the discovery about his credit, all went well with our friends—so well that the little lines of worry, which had now and then appeared on Jane's face, and threatened permanence, entirely disappeared. Philip worked with unflagging diligence in his studio, concealing his desperation so well, that his wife had only the diligence to disturb her. When she expostulated, he said, "These are my best days. I must work while the sun shines"—but, poor fellow, he was thinking that the sun would never come out of the cloud and strike the fog which environed him. He seemed to be happy in his work; but if he had dared to touch on that point in the hearing of any mortal, he would have made a dismal revelation. And yet his condition was blissful, as he perceived, when compared with that to which he was reduced as soon as his creditors began to exhibit anxiety in regard to their loans. One of these, suspecting the state of affairs because Philip avoided him, began to be very pertinacious; and Philip, of course, resented that. Jane had been building so confidently on her husband's success and fame during this year, that she

bravely endeavored, in her ignorance, to stay this rising trouble—vainly, of course—since there is but one way of ridding yourself of a pertinacious dun, and that is, by paying him what you owe.

Dismayed by her lack of success, fighting in the dark as she was, the wife's attitude toward her husband was one of entreaty. "For Heaven's sake, Philip, don't fail!" she seemed to say.

The appeal, based on loyal confidence, had its effect on him. Not a pleasing effect. Philip was so disgusted at his inability to control Fortune and command her favors, that the next friend who asked for the payment of what he owed excited all the ferocity that was in him, and, mild man though he was, he had enough of "forest ranger" in him to make his creditor indignant when he made it manifest. Thus he lost a friend, and the loss embittered him.

And so matters went on; it seemed inevitable that they should go from bad to worse, till there was perfect chaos and ruin.

Philip had, of course, real ability as an artist. I say, *of course*, because he had already accomplished what is never accomplished without ability, he had found an enthusiastic and proud admirer in his wife, and thoroughgoing abuse, as well as intelligent blame and praise, of critics. But the progress he was making answered as poorly his expectations as it answered his needs. He had calculated on high flights before he had tested his power to run well. Such skill as he had up to this time exhibited was the skill which may be acquired without the exercise of great patience. He despised plodding, not knowing what he did. One would have been slow to predict for him the joy of the adventurous explorer who finds the oasis in the desert, because it seemed likely that he would keep to the forest borders, rather than strike out boldly across the sands for the promised land. Plodding is the sacrifice which genius devoutly offers to the great God-power—in despising it, Philip of course knew not what he did. Perhaps the excessive praise of well-meaning but not over-wise friends, when he was quite young, praise so lavishly bestowed that the doing of what men call a "great work" would hardly have justified it, fostered his self-conceit to a degree that no amount of success would have surprised or even satisfied it.

So here he was in his twenty-seventh year, harboring this Ishmaelitish notion that he was neither understood nor appreciated, and that he was in the world too soon, and going to prove a failure because there was no demand for really good pictures.

He wrapped himself up in his gloom and awaited eclipse in silence, and it came with a rapidity on which even he had not calculated. Thus, a picture on which he had lavished months of labor was sent from the exhibition walls to an auction-room, and there sold for seventy-five dollars. It was enough to make any sane man mad.

Mr. Green's surprising works, dashed off in a day and sold at the same time, brought three times the sum. Reflect on that for a moment.

Philip thought of Haydon and Tom Thumb, and he did not seek the remedy of the former. But he said to his wife, who by some mischance had become possessed of the newspaper which contained an account of the sale, "I have a little self-respect left, Jane, if I have none for the art-knowledge of this city. I shall send no more pictures to exhibitions, or to auction-rooms. The dear public have seen the last of me for one while."

The dear public would have smiled to hear him. What did it care? It had not asked him for any thing, and if he persisted in giving what it did not want, why, he must not expect an excessive display of gratitude.

The young lady, his wife, to whom he communicated his resolve, tried bravely to smile, but, failing in that, said with determined spirit:

"There must be good judges of good pictures somewhere,

Phil. Come! we'll search to the world's end rather than give up beaten."

"The journey would be a short one," thought Philip, ruefully, "unless we went on foot and begged our bread by the way." He could not say this to Jane, but he brought himself to say a thing much more cruel, which was this: "I can't think of any thing better for you, dear, than to go back to your father. He invited you to come. We shall be obliged to do something desperate—and I don't want to do any thing by halves. This I confess, is the most desperate thing that I can think of."

He spoke without looking at his wife, and was thankful, though rather surprised, that she neither fainted nor broke out into crying. It had been for some time evident to him that they must make a move, and this was the last day they would be able to remain in their present lodgings, since the sale of *Hagar* had brought him only chagrin.

"We must go somewhere," he continued in a dry, hard voice. "It costs too much to stay here, and I—" here he broke down—after all, he could not put the fact into words—could not say to Jane that he was unable to support her.

It was now her turn to speak.

"You think that I had better go back to my father?"

"I do."

"You will be better off, if you are rid of me, dear?"

He turned angrily toward her, and at that she laughed outright. It was a wise thing to do; he looked so desperate, and she felt so at her wit's end, that a laugh was the best thing possible. Tragedy was becoming too tragic.

"I'm very glad that you don't insist upon it," said she in a moment. "You really mean, Mr. Secretary of the Treasury, that we are without funds necessary to go on?"

"Jane, don't question me further."

"Pride and poverty, I have always heard, have a tough time of it together."

"Am I not sufficiently humiliated? Pride! I haven't enough to keep me from saying all this to you!"

Philip found it comparatively easy to say this though, for Jane had turned away from him and was exhibiting the "versatility" for which she had always been remarkable by giving her attention to the fine things in her bureau-drawers. She now looked into their depths with an intentness which indicated search, or indecision; at last she took up hastily a jewel-box and walked rapidly to her husband.

"Philip," she said, a fine color mounting to her handsome face, "we were married once—and here's the evidence that it was considered quite an event. What a jam it was!"

"A fortunate thing for you, that! The most brilliant match of the season—two thousand cards out—more or less—wasn't that what they said in the papers?"

"How can you tattle so? fortunate? I don't think it was. Perhaps it would have been if we had really been married, and you hadn't kept your own counsel in this shameful manner. We will be married over again now, if you please, and here's a wedding gift for you, which won't get talked about in the papers. For richer for poorer this time, and till death us do part. You don't want me to go. You would be lost if I went. What *would* become of you, Phil?"

Then both were silent. What could a poor fellow say with such a wedding-gift as that mass of precious things which she had poured into his lap, he by stress of circumstances compelled to accept them? As for Jane, she had come to the end of words. But a long time after that day of her second marriage, as she always called it, she was saying to herself, over and over again, "For richer, for poorer—" and thinking what weighty meaning was in the words.

These young persons now went into less conspicuous quarters than they had hitherto occupied. In a measure they were lost to sight. It is quite easy to die in a great city; nobody expostulates with you if you are resolved upon it.

The wonder is how any one lives on when dying is so easy. How beautifully modest too it is, to retire in silence!

They lived on their bridal jewels, when these had been transformed into bread-fruit, and each in the eyes of the other became more lustrous and beautiful, as if crystal and pearl had by some surprising process become transformed into blood, bone, and tissue.

As time went on, they continued to "hold their own," and to pay as they went, and of the darkness there was no return.

Philip sent nothing to the Academy in these days. Now and then inquisitive persons and friendly persons asked why not, and received no satisfactory answer. He worked, though, every morning in his studio, and elaborated, and thought, and experimented, as though he had the mint at command, and an indefinite extension from old Father Time. His wife admired, praised, was astonished—but also she was troubled not a little, for he made no effort to bring these pictures before any buyer—he exhibited nothing. When he finished a work, he turned its face to the wall, and seemed to forget about it. How long would this go on? and how long was it likely that they would be able to live on pearls and diamonds?

Jane asked herself this question, and answered it by saying to herself, "You fool! he has hit upon some way of making money, that's what he does when he is away from you. He merely keeps on with his painting—Heaven knows why."

One evening she asked him, as others had done, though in a very different spirit, why he did not send two or three of these pictures to the spring exhibition.

The answer he gave her was rather more satisfactory than the others received, though it was in the old strain:

"I will wait till people are glad to hear from me," and she perceived that, though he said it with pride, he spoke now without bitterness. What was the secret of this patience, this resolve? They were walking up the avenue in the moonlight, when she made a bold advance and said:

"How many pupils have you, Phil?"

"One," he answered.

"Pupil must pay well."

"Yes, it would be foolish to expect better pay."

They were both silent for a moment, and shouts as out of Bedlam in that moment broke on the air. Bidders and buyers were at their work like madmen within the doors of the handsome building they were passing. They went on in silence for a block or two, then the doubt which long had troubled Jane expressed itself.

"Phil, I had rather starve than think of you in such a place at work for me, gathering bread-fruit."

"No danger," he answered, half laughing. I might shake a tree like that long enough before any thing would fall for us."

Jane made no reply. She hoped her silence would win his confidence, but it did not, and so she said:

"There is only one thing I ask for, and that is to see a picture of yours, a *perfect* picture in the Academy, before I die."

"Am I on the road to that?" he asked, with a gleam in his eyes which she did not see.

"You know best yourself."

The answer expressed so well what Jane had wished to say, that the chief thing she desired was to be able to trust him perfectly—that she acknowledged afterward to herself, that she could not have accomplished more in an hour's stroll if she had determined beforehand on their talk.

Time went on, and it became more and more clear to her that the unshared secret was a blameless one. Whatever work he was doing, Philip's conscience was easy about it, and so Jane ceased to speculate concerning it. She hoped that he had not undertaken a class of private pupils to worry the life out of him; perhaps he worked on the preparation of "artist's materials;" he sometimes came home with daubs on his garments, which he certainly had not obtained in his studio. No matter, he was

cheerful and well; he preserved a steady hand, clear sight, and his great art aims. So all must be well. She asked no more questions, but tore up the weed of doubt, poison-rooted, which had flourished in the shade. "If there must be a secret," she said, "there are two that can play at that. Why shouldn't I have one as well as he?" But—can a woman keep a secret?

It was in these days that Jane Rumsey's brother, Mr. Watson Barnard, went abroad with his wife, and old Mr. Barnard, with whom they had lived, was left in solitary state in his lonely old mansion. Mr. Watson was ordered off by his physicians, so there was nothing to be said or done except the thing that would hasten his departure. But it was a sad plight that the father was left in, deserted by his son to all intents, feebleness, old age, and general misery fastening upon him.

In those days Jane proved herself the good daughter, spending a part of every day in her old home. The old man felt the comfort of her presence, and more and more relied upon it—and she was cheerful company for his sick-room, she was so strong, so cheerful, so manifestly satisfied with her portion in this life. Her father had, as it were, turned her off, and she had been able to get on without him—while his son had done what he would, Jane had been shifting for herself as best she might—but how she had flourished! while Watson was a breathing agony. These were among Mr. Barnard's reflections day after day as he saw her come and go. He would have dismissed the thought had it been possible, but possible it was not.

As time went on, it became evident to Jane that sooner or later her father would say to her, "There is no use—I can't be left to myself—you must come here, you and Rumsey. You spend most of your time now in the street coming and going." One evening as she was about to leave him, he did make use of almost these very words.

When he had done so she knew of course that though Philip would raise objections, he would be obliged to remove them. And—this was a question! would old friends and the old way of life be restored by her return to her father's house? Can this earth by any process get back her old lizards and her ancient ferns? Are they not all gone indiscriminately into oblivion, that we may have light and warmth in our houses? Hail to the fossils by whom we are what we are!

When Jane took the stage at its up-town terminus it was growing late in the afternoon, and for some distance she was the only passenger; but seats were taken on the route by one and another, until, entering Broadway below Fourteenth Street, they were caught in a tangle, and for three minutes at least policemen were occupied in untying the hard knot of horses, carts, stages, and foot-passengers.

She had nothing to do then except to look around her, and this she did. It was while doing so that an angel with unseen hands lifted up a sign before her face by which she was to conquer.

The door of the stage preceding them, that door on which her eyes chanced to fall, held her attention in a way that drew her forward on the seat toward the window, and her fellow-passengers perceived, of course, that she was greatly interested in watching the dexterous management of the guardians of street order. Not so. Neither was that sudden movement of hers intended to hide the tears which started to her eyes. She only wished to ascertain whether she was indeed to believe what those eyes had seemed to see. For what *did* they see, but a picture on the door of the stage in advance, which she knew no hand but Philip's could have painted, unless it was a hand which his had guided?

Withdrawing her eyes from that scene, she glanced around her at the sketches painted above the windows of the stage in which she rode. In that rapid survey Jane Rumsey, wife of Philip, seemed to see much more than enough.

The stage moved on again, but now at a snail's pace, while one of the passengers at least felt as if she could fly. Finally, when she had decided that she could sit there no longer, she

pulled the driver's check. Doubtless it was an annoyance to other passengers that the woman in the corner should not have discovered, till just after they were again in motion after that tiresome delay, that she had gone as far as she wished! Had she been asleep, they grumbled. What cared Philip Rumsey's wife, her swift feet gliding over the pavement? Anybody who passed her might have said, "There goes a happy woman!" She was thinking with joy that, even if Philip should fail at last as an artist, he had perfectly succeeded as a man.

Ascending to her room on the fourth floor, it seemed to her that the most delightful home atmosphere pervaded it. Once she would have thought, "What! up there!—crowded in among all these buildings! I should suffocate, even if I did not go distracted with the din."

Contemplating it now, and in the light of the necessity of returning to her father's house, she could have wailed Eve's lamentation.

Philip had not returned yet, and she said to herself, "If that is his secret, I will respect it," and she fully intended to act upon her resolution; but when he came she had said little to him, by no means had exhausted the topics of talk, had not even touched upon her father's proposal, when these words burst forth:

"While I was riding down this afternoon, Philip, I made up my mind that no matter how many twenty-thousand-dollar pictures you paint, I shall never keep a private carriage."

"Why?" he asked.

"Because we couldn't set up such a gallery of pictures in a coach as we have in a stage."

There was a lazy indifference in the answer which Philip returned, after a moment.

"Pictures enough everywhere. You need not abstain from the coach on that account. By-the-way, Jane, look at this vase, from Paris! I've had it in my possession some time, you must pardon me for not presenting it before; in fact, I hardly know how to do it now. Excuse my awkwardness."

No wonder they both laughed when the artist, discovered as an illuminator of public works, revealed to the porcelain-painter the fine vase which the dealer had marked "Paris!"

No wonder that they laughed with tears in their eyes. Let those laugh that win. Jane had won as well as Philip, in the great struggle for life, and her husband had watched her proceedings with a pride which induced him to secure for her this fine evidence of her success, some time before the dealer would be able to import duplicates for the market.

But he had not expected that when he crowned her with a love-worthier than he had given her on their first or even on their second wedding-day, she would have ready for him a wreath of honor everlasting.

And now they must talk about going back to affluence, and the great temptations of the world. Well, they had passed through an experience which had so much enriched them that I have not scrupled to borrow of it in behalf of any who choose to appropriate the results. Certain omnibus-pictures and Paris-painted vases to my thinking may be numbered among the finest of the specimens of high art to be found among us.

## A SEAL-HUNT IN IRELAND.

IN one of the most remote and unfrequented spots in Ireland, amongst the crags and rocks near Derrynane Abbey, long celebrated as the seat of Daniel O'Connell, "the Liberator," there is a strange and curious cave. It lies nearly opposite to Scariiff Island, and is protected by a cordon of rocks which rise up out of the sea as if to guard its mouth. But the great peculiarity of it is, that the interior of the cave is only accessible for an hour or two during spring tides, and, as these only happen periodically once a fortnight, or every month at full moon, the cave's mouth may be considered as practically closed to mankind. But, though closed to men, it is at all times open to the seals, and these remarkable animals have found it a most secure

retreat; and, when weary of fishing or amusing themselves sporting in the Atlantic, they retire to this cavern in security, and make it their resting-place at night.

To attack these seals in their own cave was the object of our expedition. This required much care, and to attempt it was a service of some danger. But we heard that it had twice been attempted before, and once with success. The necessary conditions were as follow: a calm sea, tolerably warm weather, a full moon, and of course the high spring tides and consequent low strand which accompany the full moon. Without calm weather, no power could get a boat into or even near the cave, as the swell of the Atlantic would inevitably dash it on the rocks. The high strand of the spring tide is necessary, lest the entrance to the cave should be covered with water, as it is at all other times; and, as no man could dive into its unmitigated darkness and live, the spring tide must be waited for to reveal its mouth and render its inner caverns accessible. Warm weather is also an almost necessary condition, as the length of space necessary for the seal-hunter to swim is so considerable, that he might otherwise become numb with cold at the very moment when all his energies and strength would be required.

All these conditions appeared to be fulfilled during our stay at Waterville, in September, 1856. My son and I had taken up our abode at "Tom Danahey's," a little road-side inn, well known to all fishermen at Waterville.

Mr. Clementi—a gentleman residing in that neighborhood, and who had explored the cave once before with success, having killed a magnificent seal there—kindly offered us his escort; and, having secured the services of the guide, who had first discovered this abode of the seals by observing them swimming toward it in the evening, our party was complete. We hired a good strong fishing-boat, manned with ten oarsmen, and commanded by a shrewd old "captain," as he was called by the crew, who was well acquainted with every rock and shoal between Ballinskelligs and Derrynane.

Our equipments were not numerous. My son and Mr. Clementi, both of them good swimmers, had prepared formidable clubs, which of course floated, and which they towed with them when in the water by a string which they held in their teeth, so as not to impede their swimming. In the bands of their low-crowned hats they had each a long pliable sort of candle, made of a large double-plaited wick, dipped repeatedly in tallow, which stuck up in a strange way from their hats, resembling an eagle's broken feather. Inside their hats they had a supply of lucifer matches, lest by any chance the candle should be extinguished. Their hunting-dress consisted of two pairs of woollen stockings each, to save their feet from injury on the rocks. The guide wore a waistcoat on his body—nothing else. In his hat was the same strange-looking candle, and he had besides a quantity of chips of split bog-wood stuck round its sides, which, in the moonlight, gave him the appearance of an American Indian chief.

I took nothing with me but my ordinary clothes and a swimming-belt, as I did not feel equal to such an adventure as that now projected; but, should occasion require it, I was prepared to go in and render any necessary assistance. The distance from Waterville round Ballinskelligs Bay to the scene of action near Scariff Island is not less than eight or ten miles. Little more than an hour brought us round the headlands and near to the outside of the rocky cordon.

Hitherto I had been steersman, but now the old "captain" of the seine boat came to the stern, and without speaking a word pushed me quietly aside, as if I were a log of wood, took the helm from my hand, and, giving one or two quick orders to the men in Irish, we found ourselves suddenly amongst the breakers, and so close to the rocks with their dark shadows overhanging, that the men were compelled to row with shortened oars.

"Mind what you are about, captain!" shouted Clementi.

"Never fear, sir," replied the old man in his quiet, steady voice. He stood firmly in the boat with an expression of intense watchfulness, courage, and confidence in himself. Though an old and poor and small man, so complete was his influence not only over the men but over ourselves, that I think had he dashed us straight at a rock I should have looked with confidence to a safe result.

Our passage amongst the breakers was a dangerous one. Though the sea appeared comparatively calm outside, yet amidst the rocks a considerable swell was apparent. Sometimes we rowed with shortened oars, the rocks jutting out so near that the men had scarcely room to pull. Sometimes a sudden cry from the captain of "Back water,

boys! back water for your lives!" made us aware that we were proceeding at imminent risk. And when, at last, after poising the boat for a few minutes on the top of each swell as it rolled on, the captain wildly shouted, "Now, boys, pull, pull for your lives!" I found he had been calmly waiting for a wave of sufficient volume, on the swelling top of which we might actually leap the cordon of rocks which surrounded the mouth of the cave. In a moment we were inside the rocky barrier, the immediate danger was past, and we found ourselves within the smooth amphitheatre in which the mouth of the cave is situated.

We now rowed on, preserving the most perfect silence, lest the seals should be disturbed. The hunters stripped off their great-coats and prepared for action, and by degrees we approached the cave. The entrance is very narrow, and the split on the outside of the rock which forms it appears to be immensely high; but the spot was so gloomy, and we came so suddenly under its shadow, that I could not measure its proportions. No one spoke aloud, but the guide came stealthily up, and asked me for a knife. I lent him one, and he put it into his waistcoat pocket.

The time of action had now arrived; my son and Clementi struck each a light, and, applying it to the strange candles in their hats, a bright flame blazed forth, which set off the dark shadows of the cave in formidable contrast. Both now fixed their hats firmly on their heads, looked carefully to their clubs, and slipped up quietly to the bow of the boat. In a few moments we had entered the cave, and, pushing the boat forward with our hands (the sides of the rocks being so close that we could not use the oars), we advanced some thirty yards into the dark cavity. I now lit a match, and, applying it to a torch made of split pieces of bog-wood tied tightly together and saturated with tar and turpentine, a complete illumination of the cave was the result. We soon came to a stop, the boat having no room to proceed farther within the narrow creek. In a moment—silently, like a cormorant gliding from a rock—down dropped the guide from the bow of the boat into the water. He was instantly followed by my son and Clementi, all of them as silent as death, and away the three hunters swam, right up into the darkness of the cave.

To us who remained in the boat the whole scene had the strangest effect, and raised feelings within us of the most intense interest and excitement. Instantly, almost before we could realize the fact, the three adventurers were seen swimming rapidly into the depths of the narrow cavity, the water many fathoms deep, and so clear that we could see every stroke of their limbs by the torchlight, while the candles in their hats gave a lurid and most unnatural effect to the scene. And when we remembered that they were bent on attacking the formidable seal in his own element, and in his own chosen home, it may well be imagined that feelings of no ordinary anxiety prevailed over our minds.

"My God!" briefly exclaimed one of the men as he saw the three swimmers drop silently and suddenly into the sea. It was the only exclamation which escaped the lips of any of us; but the men rushed so violently to the bow of the boat to watch them, that I had to force them back with my torch. On they swam, the three lights rapidly diminishing as they penetrated deeper and deeper in, until at length they appeared like little twinkling stars glowing in a canopy of jet.

I confess I felt nervous and excited to a degree I have rarely felt before. My son was one of the three; and the strangeness of the whole scene, the gradual disappearance of the lights, the darkness rendered visible by the blazing torches, and the knowledge that, if disabled by any accident, it would be almost impossible they could return alive from a contest with the seals, produced feelings of undefined apprehension which it is difficult to describe.

At length we heard a strange sharp cry, and a curious flapping noise, while we could plainly see the water splashed violently about the distant lights. We were much alarmed, and could not conceive the cause, but we afterward ascertained it had been occasioned by an absurd adventure. A large cormorant, seeing the swimmers approach in this unusual fashion, had dashed at them with extended wings and open beak, and seized my son first by the cheek and afterward by his bare arm. He caught the bird by the neck, and, dragging it under water, cast it behind him. No sooner had he let it go than it dashed, still under water, at Clementi, who was close behind him, and caught him by the foot. He, being ignorant of the attack the bird had made upon my son, and finding himself caught beneath by some unseen animal, naturally thought that a seal had laid hold of him, and uttered

a sharp cry! The cormorant, however, soon let him go, and, seeing that the invaders were passing on and that no evil was intended to her brood, returned to her place of ambush.

On the adventurers swam, deeper and deeper into the cave; at times the lights were scarcely visible to us—sometimes only one appeared, and sometimes they disappeared altogether. Again we could see them rise high in the chasm as the bearers scrambled over rocks in their way, and down they sank again as they plunged into the water, until at last they reached a part of the cave where a great rock projects down like an inverted cone from above, and chokes up the entire mouth of the cave, except a small opening of about eighteen inches wide by two feet high, which is exposed at low-water spring tides. Through this narrow gate they passed, and we saw them no more for a while.

But they soon reached the bed of the shelving beach where the seals had made their home. We could not now see even a twinkle of the lights, and all was perfectly silent for a space of five or six minutes. Our anxiety increased in intensity.

I knew that my son was deep in the recesses of the cave, and in the act of attacking the seals. At last we heard a distant shout, which I fancied was his voice; and, disabled as I was by a recently-sprained knee, I was just going to fasten on a swimming-belt, and place a lighted torch in my hat, that I might make my way into the cave and render what assistance I could, when I heard another shout, and again another, repeated in a cheery tone. "All right!" exclaimed the boatmen. "Stay where you are, sir: they surely have one now!" We all sat silent as the grave, and in ten minutes more we could again perceive the distant twinkle of the lights: nearer and nearer they approached, until at last we could plainly discern the swimmers.

We had brought a blue-light with us; and, anxious to cheer them and show them where we were, I struck it against a rock; it instantly ignited, and, to the amazement of all in the boat, the scene became as light as day in a moment, only tinged with the lurid color of the blue-light. Clementi was the first to arrive, and we hauled him into the boat, his teeth chattering with cold. Then came my son, his club broken in his hand. The light in his hat was out, and he appeared to be much exhausted. We got him up also, with some difficulty, into the boat, where he sat for a time trembling with excitement and cold. Behind him, about fifty yards distant, came the wild Indian chief. He swam slowly but steadily along, towing by a cord behind him a *dead seal*! The men gave a ringing cheer of delight, as the guide and his seal were lifted in triumph into the boat.

"Who killed him?" said I in a low voice to my son.

"I did," returned he in a tone equally low. This was all that passed between us.

The Indian chief was in great delight; he laughed and talked and chattered Irish, and dashed about the boat, rushing from time to time at my son, and almost upsetting him by the encouraging blows he dealt him on the back. And in less than two minutes every oarsman in the boat was thoroughly acquainted by our loquacious guide with all that had passed in the cave.

The swimmers now dried themselves as well as they could, and put on their clothes and great-coats. They had had a long swim. The cave into which they had ventured could not have penetrated less than two hundred yards under the land. The ocean swell was difficult to manage; and, as they neared the shelving beach, it dashed them against the rocks and stones. The passage though long was very narrow, scarcely ten feet wide; so narrow that, had the seals rushed down in a body to the sea from their resting-place, the conflict might have been most serious. It appears, however, that our party had arrived too early. "The seals had not come home from fishing"—as our guide expressed it; only one was found in the cave, and that met its fate from my son's club. Down the beast came shuffling along close beside where he was standing; and so terrible was the blow he dealt it as it passed, that it fell quite dead at his feet, the skull shattered like an eggshell, and the club broken across in his hand. Had several seals happened to be "at home," the encounter might have been most formidable.

The clear bright rays of the blue-light discovered the strangest variety of birds, who had nestled high upon the rocky ledges to roost. Some shrank back into the crevices of the rocks almost paralyzed with terror at the strange light which had so suddenly penetrated the cave; others peered down in wonder at the unusual scene in the boat. And right under the very bow of the boat swam the still infuriated cormorant—no quailing with her, notwithstanding our apparent

superiority; she seemed to have no idea of fear. There she stayed, swimming about, ducking her head, and challenging us in the most defiant manner, by every gesture she could exhibit, to come down and fight her fairly in her own element. She seemed so determined upon battle, that one of the men was about to strike her upon the head with an oar, but I forbade him. I could not allow the gallant little challenger to be injured.

## DESCRIPTION OF THE RAINBOW.\*

"O thou, Light! eternally one, dwell there, on high, with the Being, eternally one! Thou, O changing Color! descend in friendly guise to man."—SCHILLER.

NO scene that Nature presents better symbolizes this fine thought of the poet than the magnificent arch painted by the sun upon the dark clouds of a retiring tempest. In all ages, the rainbow has charmed the imaginations and awakened a feeling of hope and consolation in the minds of men. The Hebrew, impressed with the remembrance of the former floods that came upon the earth, felt his soul, that had been disquieted by the thought, resume all its serenity as he beheld the bow of promise. For him it was the token of Jehovah's pardon. The gay fancy of the Greeks made the rainbow the presage of happy tidings to the earth. The goddess Iris, the messenger of Olympus, according to their creed, left her transparent scarf floating on the clouds.

Ingenuous fiction vanished at the approach of science, and the explanation of the rainbow is, to-day, one of the most complete parts we have of the physical theory of light. It is to Kepler, whose genius was prolific in so many directions, that we are indebted for the discovery of the first causes of the phenomenon; he put it on record, although very briefly, in a letter written by him in 1601. Newton studied these causes with all the rigor of geometrical calculation, and was enabled to render an account of all the different modifications observed in the rainbow. After having calculated its dimensions, he verified the correctness of his observations by actual experiment.

We never see the rainbow except when standing with our backs toward the sun, the space in front being traversed by a shower of rain, a cascade, or a simple jet of water. When the sea is agitated by a violent wind, and the sun's rays strike the spray of the billows, rainbow curves and arcs are often produced upon it.

Usually the phenomenon consists of two concentric arches, with a considerable interval between them. The centre of these, as it is easy to prove, corresponds with that point in the heavens where the shadow of the observer's head would fall. The interior curve, which is the oftenest seen, presents a series of prismatic radiations, arranged in such wise that the violet falls inside and the red upon the outside. In the external curve, the colors of which are much weaker, the order of the series is reversed. Sometimes three bows are seen, but this occurs very rarely. The third, of an extremely pale hue, presents colors arranged in the same order as in the first instance.

The dimensions of these bows depend upon the height of the sun above the horizon. It must be close to the latter, in order to enable the observer, standing on the surface of the ground, to see arcs or bows embracing a half circumference. It is only from the summits of mountains, or from a balloon high up in the air, that complete circles are visible, unless, as they frequently do, they appear in the spray of great waterfalls. A grand spectacle of this nature is enjoyed in contemplating the magnificent cascade of the Reichenbach. When we saw it, the sun was rising, and the brilliant, aerial coronal crowns were floating above the chasm into which the waters plunged. Immense arches of the same kind form upon the white mist that rises over Niagara Falls.

All the appearances of the phenomenon of the rainbow show that it is produced by a modification of light taking place in the drops of water. These drops are spherical, and, during a shower, follow each other so rapidly, at every point, that we may reason concerning them, as though they remained entirely motionless. The ray that penetrates the drop of water is refracted and decomposed. Instead of issuing from it undiminished, as it went in, it reflects itself partly on the concave surface opposite to the point where it entered and passes back through the globule, until it again meets the surface. There a similar

\* From "Metecore and Meteorological Phenomena," translated from the French, and in press by D. Appleton & Co.

subdivision takes place. One portion of light passes into the atmosphere, and the other is reflected. By a geometrical diagram, it can be demonstrated that the drops, which may send back to the eye of the observer rays that have been reflected once, or several times, are placed at certain heights, and form circular colored bands, each with a breadth

equal to the diameter of the image of the sun. The bands corresponding to a single reflection are at an angular distance of nearly forty degrees from the centre. Those in which the light is reflected twice are nine degrees farther off. In each group, the differences arising from dispersion are small enough to cause the bands to

range themselves one above the other, thereby giving rise to the series, sometimes regular and sometimes reversed, of the colors of the spectrum.

There is a simple method of accurately observing the passage of light through drops of water. Suspend a globe of thin glass in a dark room, by a cord passing over a pulley. When the globe, filled with water, is so placed that a ray of light, allowed to fall upon it through an orifice in the window-shutter, forms an angle of nearly forty-two degrees with the line that connects it with the eye, all the colors of the spectrum, commencing with red, can be seen, one after another, by merely lowering the globe gradually from point to point. If the water be muddy, the passage of the ray can be observed, and we can see that it undergoes but one reflection. When the angle, formed by the two lines, is fifty-four degrees in measurement, and the ray is made to fall upon the lower part of the globe, the colors are observed to form in like manner, and in the same order, when the globe is gradually elevated. The two reflections can then be easily distinguished in the water.

According to the explanation thus given, the rainbow is found to be purely a local phenomenon. Each spectator sees a different arch. If the rain-cloud be near, two observers, placed at some distance from each other, see the ends of their rainbows resting on different points of the ground. This fact is particularly evident when one is standing

opposite to a mountain upon which the bow is projected.

Rainbows in which the colors were extremely faint have been observed in dense fogs. This appearance arises from the diminutive size of the drops of moisture. The great whitish ring, or circle, seen by Ulloa and Bouguer during their stay on the Pichincha, seems to have had this origin. It has been called the *white rainbow*, or the *Circle of Ulloa*. Its dimensions are those of the main arch usually seen, and it is perceived only from elevated places, simultaneously with the formation of rainbow-like halos around shadows projected on the fog. We have reproduced the description of this phenomenon given by Bouguer, and will add what Ulloa says of it:

"He was on Pambamarca, with six companions, at day-break. The top of the mountain was entirely covered with dense clouds. As the sun rose, it dispelled these clouds, and nothing remained in their stead but some very light mists, which it was almost impossible to distinguish. Sud-

The Rainbow.

denly, on the side opposite that on which the sun rose, each of the travellers saw, at a dozen fathoms from where he stood, an image of himself reflected in the air, as though upon a mirror. This image appeared in the centre of three rainbows, shaded with different colors, and surrounded, at a certain distance, by a fourth arch, of a single color. The tinting farthest on the outside of each arch was flesh-colored or red; the next shade was orange; the third was yellow; the fourth straw-color, and the last one green. All these arcs

The Circle of Ulloa.

denly, on the side opposite that on which the sun rose, each of the travellers saw, at a dozen fathoms from where he stood, an image of himself reflected in the air, as though upon a mirror. This image appeared in the centre of three rainbows, shaded with different colors, and surrounded, at a certain distance, by a fourth arch, of a single color. The tinting farthest on the outside of each arch was flesh-colored or red; the next shade was orange; the third was yellow; the fourth straw-color, and the last one green. All these arcs

were perpendicular to the horizon; they moved about, and followed the person reflected, in every direction, surrounding his image like a *gloria*. What was most remarkable was, that, although the seven travellers stood together in a single group, each of them saw the phenomenon only in relation to himself, and was disposed to deny its existence in reference to the others. The extent of these arches increased progressively in proportion to the height of the sun. At the same time their colors faded away, the *spectra* became paler and paler and more vague, and, at last, the phenomenon entirely disappeared. When this display began, the shape of the arcs was oval, and, toward the last, it was perfectly circular."

When light clouds pass over the sun or the moon, there may be perceived around those luminaries one or more colored circles known to meteorology as *crowns*. In all these circles, we distinguish the prismatic colors, the violet being placed inside and the red outside. They are at an equal distance from each other, but this distance varies according to the condition of the clouds and the atmosphere. The angular diameter of the first circle is ordinarily comprised in from one to four degrees.

"All clouds," says Kaemtz, "that are not too thick to let the light of the sun pass through them, the *cirrus* and the *cirro-stratus* excepted,

present traces of crowns, but the brightness of the colors is not always the same. I have never seen them so handsome as upon fogs, which form during the night in the valleys, and ascend toward the middle of the day to the summits of the mountains. When strips of cloud passed between the sun and me, the colors had a vividness which I have rarely seen in

them. They are no less fine on the *cirro-cumulus*, particularly when they are in small masses of dazzling whiteness, and so confused on their edges that it is difficult to trace their outlines on the sky."

This phenomenon is, in its turn, explained by the refraction of luminous rays passing near the globules of water that compose the clouds. A very simple experiment gives us an imitation of the process. We have only to hold up before a lamp a strip of glass besprinkled with lycopodium or vegetable sulphur. The fine grains of the latter substance, acting as globules do, the flame of the lamp is at once surrounded by prismatic rings separated by equal intervals.

In the phenomena of which we are about to treat, small crystallizations of ice, and not globules of water, modify the light. We are sometimes surrounded by fogs formed of such particles. They frequently exist, as *aéronauts* have ascertained, in the higher regions of the atmosphere, where they form the clouds called *cirrus*.

If the play of the luminous rays in the little spheres we have been considering has given us such pleasing phenomena, we may readily comprehend that, when they pass through limpid crystals with numerous facettes, we shall have fresh harmonious combinations of geometrical lines and of colors to admire.

In temperate climates, the phenomena of this order most frequently remarked are the *halos*, or colored circles, that surround the sun or the moon, but in a manner different from *crowns*. The arrangement of the colors of the *spectrum* is usually reversed in them, the red being placed inside. The distances of the circles from the luminary are equable, and much greater than in the *corona*. Thus, the interior

halo is from twenty-two to twenty-three degrees in diameter; the second halo, usually called the external one, measures forty-six, and the third ninety-nine degrees in diameter. Brewster imitated the halo by placing a strip of glass covered with crystallized alum before a lamp. In order to thoroughly comprehend the formation of this phenomenon, we must suppose a very great number of prismatic needles suspended in the air. These prisms, in certain positions, may revolve for a considerable period on their own centres, without the deviation of the refracted rays changing perceptibly. The multiplicity of these rays proceeding in any one direction, giving the eye a more vivid impression, colored belts or bands are seen, placed one above the other, as in the rainbow.

When the sun or the moon is near the horizon, and the atmosphere remains calm, the needles of ice arrange themselves vertically, and brilliant spots—diffused images of the luminary—are formed along the horizontal diameter of the halo, and a little outside of each circle. These take the name of *parhelia* or *paraselenæ*. *Parhelia*, those of the interior halo, especially, are finely colored, all the shadings of the spectrum following the red which is next to the sun. When the latter luminary rises, the spots withdraw from the circles, remaining, however, on the line of the horizontal diameter.

Colored Halos.

Sometimes we see resting upon the halos what are termed *tangential arcs*, or *arches of contact*, of very brilliant color. The most frequent are those that form symmetrically at the extremities of the vertical diameter of the halo of twenty-three degrees. Those of the external halo, which are more rare, but more numerous at the time, touch it, not only in the

vertical line of the sun, but also at the lateral points, forty-five degrees distant. The most elevated of these arches, which has the zenith of the observer for its pole, is sometimes designated by the name of the *circum-zenithal circle*.

We cannot here enter into details, as to the manner in which these appearances are produced by the refraction of light in the crystals. M. Bravais, in his learned researches on this subject, did not confine himself to calculating all the circumstances of the phenomenon; he succeeded in reproducing it artificially, in a dark room, by means of an ice-prism which he caused to revolve very rapidly while the rays of the sun were projected upon it.

## GOLD AND SILVER MINING—PRACTICAL AND SPECULATIVE.

BY A WELL-BURNT BUT FINALLY SUCCESSFUL MINER.

TO acquaint persons residing at a distance from districts where the precious metals abound, with the course and procedure of practical mining, would require a separate article on each of the following topics: 1. How to discover or find a mine. 2. How to ascertain whether a discovery claim or location is valuable or worthless. 3. How so to develop a tested mine that the amount of ores taken from it can always be kept in advance of the reduction-works. 4. How to extract, in the

most economical manner, the precious from the enveloping base metals. 5. How to secure the most efficient administration of a company's affairs. 6, and lastly. How to avoid the mischances, the blunders, and the stock-jobbing rascalities that have ruined so many companies. Unless some upright, influential person connected with the company, is versed in all these matters, it cannot succeed—or, at all events, it will not attain the best results. Our space permits us to offer only a few general observations.

Mining for gold and silver is always a most fascinating occupation, and sometimes, too, a most delusive one. When successful, the profits are enormous. When unsuccessful, the owners still believe that a little larger outlay, or a different plan of operations, would have enabled them to clutch victory from the brow of defeat.

A mine has no such regularity as is commonly ascribed to it. It may pitch into the earth at every possible angle, and it may radically change its pitch at any distance from the surface. It may be thickest and poorest, or thickest and richest, at the surface, and it may vary in thickness and richness with every few feet of descent; though when it has reached its normal character, below the influence of atmospheric agencies and surface causes, it is generally regular and well defined. At a given place in a mine there may be only a small amount of good ore; but, ten or one hundred feet below, the pay-ore may abound in indefinite quantities. It may pinch, or its walls come together, and give every appearance to the uninitiated that bottom has been reached; yet twenty-five feet to the right or left on the same level the supply of rich ore may be inexhaustible. Owing to these and other irregularities, and many of the most irregular mines have proved the most productive, it requires thorough experience to mine successfully. A veteran miner or engineer deals with all the vagaries of a mine formation as an accomplished surgeon with a broken limb—he knows just what to do. But failure in other kinds of business, or even success in some of them, does not warrant the hope of success in mining. That superintendent who has had no previous experience in the field, is sure to exhaust his company's funds in serving his apprenticeship; or, if its cash-box be not completely drained, he is likely to become discouraged on the brink of success. He either works in the wrong way at first, or stops at the wrong time. The history of abandoned mines proves that, under the manipulation of competent miners, they are made largely productive in nine cases out of ten. Unpalatable as the truth is, we must say that mining is a *business*, and, like all other kinds of business, it must be *mastered* before it can be profitably pursued.

In every mining district there are hundreds of untested "claims." While an expert may not be able to pronounce decisively in favor of, he can never positively decide against, any of these. The most promising sometimes fail, and the shabbiest often prove the richest. Analogy is the mode of reasoning about mines, but actual experiment is the only safe guide in practice. Every mine has a history and physiognomy of its own, and appearances in one do not always and absolutely justify the inference that similar appearances elsewhere are connected with good ore below. Merchants and bankers in mining countries rarely make advances on claims or partially-developed mines. It is only when a mill is supplied with ore that financial confidence is created.

Paradoxical as it may appear, the richest mines are the least, and the poorest mines the most profitable. North of Nevada there is but one "poor man's" mine. That yielded several thousand dollars per ton at first. Now, if worked at all, it yields moderately. In all Nevada there is but one White Pine District, and even there, and possibly at one other locality, only a few mines yield \$1,000 per ton. During the past nine years the great Comstock mine of Nevada has produced \$100,000,000, its ore averaging about \$40 per ton. The Haywood mine, in California, has yielded \$3,000,000, yet its ores average only \$20 per ton. The very rich ore is apt to be found in pockets; or to be

so mixed with intractable base metals that the cost of separation exceeds the net product; or to be so sparsely scattered throughout a large mass of vein matter that the expense of mining it overbalances the yield of the precious metal. But a low grade of ore of \$20 to \$40 per ton for gold, and from \$50 to \$200 per ton for silver, is more likely to be found in a regular, well-defined mine in inexhaustible quantities.

Americans should rarely invest in distant mines. Favorable reports unduly elate them, and discouraging rumors unduly depress them. If they do not realize dividends at the precise moment looked for, or in the exact amounts expected, or if more money is required than it was supposed at the outset would be needed, they are apt to become disheartened. The most that is generally accomplished by companies situated at a distance from their mines, is to partially develop, and then wholly abandon them to some lucky miner who is eager to possess what the demoralized company lacked the skill and patience to work. The English, the French, and the German companies carry on mining operations with great success in all parts of the globe. They are not so impatient as Americans, and they are certainly more persistent. They evince, too, the tact and business judgment, seldom shown by American companies, of employing only the most expert and thoroughly-trained mining engineers to manage their field operations.

Speculative mining is carried on by a few schemers, who endeavor to make money under color of mining operations when there is no mine to support the pretence, or, if there be a productive mine, by exaggerating its merits, or by concealing its merits or defects. Only one of the many forms of these illegitimate operations can we describe. A party of stock-jobbers, who have no patience with legitimate mining, purchase enough stock of a dividend-paying company to secure their election as directors. This accomplished, they proceed to monopolize the balance of the stock, if possible. In this stage of their grand financial enterprise, they resort to tricks and frauds which should consign them to a State prison, but as their eventual success will doubtless enable them to "plate sin with gold," "the strong lance of justice" will "hurtless break." We will cite only a few of the many devices current amongst speculative mining financiers. The directors cause work to be suspended in the mine either partially or altogether, make useless outlays, borrow large sums of money, when they ought to get it out of the mine, originate reports of the failing character of the property, talk doubtfully about future dividends, levy assessments, and, to crown all, create the impression that they are secretly selling out their stock. A panic amongst the uninitiated stockholders ensues. All rushing into the market at the same time to sell, the price falls a thousand per cent. a day. The directors secretly *purchase* through brokers, who will not give up (or make known the names of their employers), all the stock that is offered. Now comes the second stage of the directorial scheme. Having bought the stock at a low price, they must manage now to sell at a high figure. At once they redouble or quadruple work in the mine, make new explorations, disclose to sight enormous bodies of ore, accumulate great quantities of it at the reduction-works, and crowd *them* to their utmost capacity. In due time the real condition of affairs is made known. The stock suddenly rises in price, large dividends are promised, newspapers are filled with accounts of the unprecedented yield of the ores, and of the prospects of unusually large permanent dividends. The directors are lionized for the extraordinary tact and ability exhibited in causing what was lately thought a hopeless mining enterprise, to turn out a great success. As they expected, the public crowd into the market and buy at an enormously high price stock which six months or a year before they themselves had sold at a ruinously low figure. Heretofore the directors secretly purchased stock, when the public supposed they were selling out; now the public are made to think that the directors are *buying* stock, when, in fact, they are secretly *unloading* all they own on to the eager public. As

soon as decency permits, another declension in the market value of the stock is effected, to be followed by another profitable rise.

Legitimate mining, pursued with integrity, skill, and energy, generally produces larger returns, in proportion to the capital invested, than almost any other business. Speculative or illegitimate mining can only be profitable to the unscrupulous "ring," and results in large, if not total, losses to outsiders.

### THE ROMAN SENTINEL.

DEATH or dishonor, which is best to taste?

A Roman sentinel in Pompeii,  
When God's hot anger laid that city waste,  
Answered the question, and resolved to die.  
His duty was, upon his post to bide  
Till the relief came, let what might betide.

He stood forgotten by the fleeing guard,  
Choosing that part which is the bitterest still,  
His face with its fixed purpose cold and hard,  
Cut in the resolute granite of his will.  
"Better," he said, "to die, than live in shame;  
Death wreathes fresh flowers round a brave man's name."

Life is the wave's deep whisper on the shore,  
Of a great sea beyond. The sentry saw  
That day the light in broad sails hoisted o'er  
The drifting boat of dawn; nor dreamed the flaw,  
The puff called death, would blow him with them by  
Out to the boundless sea beyond the sky.

The sentry watched the mountain's fire-gashed cheeks,  
And saw come up the sand's entombing shower.  
The storm darts out its red tongue when it speaks,  
And fierce Vesuvius, in that wild hour,  
Put forth its tongue of flame, and spoke the word  
Of hatred to the city from the Lord.

The gloom of seventeen centuries skulked away,  
And standing in a marble niche was found  
A skeleton in armor all decay;  
The soulless skull was by a helmet crowned,  
Cleaving thereon with mingled rust and sand,  
And a long spear was in the crumbling hand.

In Pompeii are beasts of stone with wings,  
Paved streets with marble temples on each side,  
Baths, houses, paintings, monuments of kings;  
But the arched gate whereat the sentry died,  
The rusted spear, and helmet with no crest,  
Are better far to see than all the rest.

O heart, whatever lot to thee God gives,  
Be strong, and swerve not from a blameless way,  
Dishonor hurts the soul that ever lives,  
Death hurts the body that is kin with clay.  
Though Duty's face is stern, her path is best:  
They sweetly sleep who die upon her breast.

### SKETCHES OF EARLY LIFE IN BOSTON.

#### No. IV.

#### HOW THEY TREATED SCHISMATICS AND HERETICS IN BOSTON.

IT is a delicate subject to handle, because of the prevailing tradition that the settlers of Boston came over the sea to establish on these American shores an asylum for the oppressed,

a refuge for the down-trodden victims of priestcraft and tyranny; where they could have freedom of thought and action, and worship God, each man according to the dictates of his own conscience. After reading their writings and surveying their deeds, we can imagine the grim smile of surprise that would have irradiated the usually sedate countenances of Mr. Winthrop and Mr. John Cotton, if any one had suggested in their hearing that such a thought as this could possibly have found entrance into their minds.

That they were actuated, among other motives, by the desire to find a place where they could carry into effect a purer faith, and enjoy a simpler worship, than they supposed to be practicable in England, we cannot doubt; but, in order to this, they considered it essential that they might be allowed to establish a commonwealth, of which they were to have exclusive control, and which they should manage according to their own views of government and religion. Those who were ready to accede to this jurisdiction, and believed as they did in regard to all matters of ecclesiastical polity and Christian doctrine, were welcome to join them; everybody else might expect to be treated as an intruder and a reprobate.

We shall now proceed to show with what firm and unvarying consistency they carried these principles into practice. If there was any one thing which they abhorred, as the most dangerous device of the devil, it was the idea of religious toleration. The first declaration of the General Court, bearing in this direction, is sufficiently explicit: "Hugh Bretts, being found guilty of heresy, is ordered to be gone out of the jurisdiction upon pain of death, and not to return again, under the liability of being hanged."

For a number of years, the records of the colony are occupied mainly with a statement of the various errors that disturbed the peace of the churches, and of the efforts made to exterminate them — the most effectual mode of settling the trouble being generally found to consist in *clearing the territory* of all persons who taught or abetted any false doctrine. It would be very tedious and unprofitable to wade through these interminable controversies: in the preface to a work published a few years after the settlement of Boston, twenty-nine "dangerous opinions" are specified, as having been recently broached in the community, such as that "the law, and the preaching of it, is of no use at all to drive a man to Christ; that a man is justified without faith from eternity; that he is united to Christ by the Spirit, without any act of his; that the graces of saints and hypocrites may be the same; that the whole *letter* of the Bible is a covenant of works; that no Christian must be pressed to duties of holiness;" and so on. The author promises, in the body of his book, to give a much more copious enumeration of the prevailing heresies, for he says these are only "some of them, to give but a taste; for afterward you shall see a litter of *four score and eleven* of these brats hung up against the sun, besides many new ones of Mistress Hutchinson's; all which they hatched and dandled."

In 1644, an order was passed "for the banishment of all who openly oppose infant baptism, or go about secretly to seduce others from the use thereof, or depart the congregation at the use thereof." This legislation seems to have been precipitated by the case of a Mr. Painter, "who on a sudden turned Anabaptist, and having a child born, he would not suffer his wife to bring the child to the ordinance of baptism, for she was a member of the church, though he was not. Being presented for this, he still refused. Whereupon, after much patience and clear conviction of error, because he was very poor, so as no other but corporal punishment could be fastened on him, he was ordered to be whipped; *not*," continues Mr. Winthrop, from whom we have the account, "*for his opinion*, but for reproaching the Lord's ordinance. He endured his punishment with much obstinacy, and said boastfully, that God had marvellously assisted him."

In the following year, the synod met at Cambridge, to consider what course should be pursued in reference to certain books which had been imported from abroad—"some in defence of anabaptism and other errors, and for liberty of conscience as a shelter for their toleration; others in maintenance of the Presbyterian government against the Congregational way here." As the writers of these works were not within reach, it was determined that the books themselves should be subjected to the harrow of criticism, and a refutation accordingly appears, entitled "The Dipper Dipt, or the Anabaptists Duck'd and Plung'd over Head and Ears."

The next year, in consequence of Parliament having sent directions to all the English plantations in New England that all men should enjoy liberty of conscience, there was an attempt by petition to obtain a repeal of the laws against Anabaptists; which resulted in an order from the court that "the laws should not be altered or explained at all."

Thirty-five years after the settlement of Boston, the Baptists—some of whom had resided in the colony from the beginning, although they were careful to suppress their opinions,—made an effort to organize a church. The leaders in the movement were fined, some of them banished, and others committed to jail. A petition, signed by several of the best men in Boston, was sent to the General Court, praying for their liberation; in which it is said of the sufferers, that "they now lie in prison, deprived of their liberty, taken off from their callings, separated from their wives and children, to their great damage and hastening ruin, how innocent soever; besides the hazard of their own lives, being aged and weakly men, needing the succor a prison will not afford; the sense of this, their personal and family most deplorable condition, hath sadly afflicted the hearts of many sober and serious Christians, and such as neither approve of their principle or practice." The result of this interference with the high behests of the law was, that the more prominent petitioners were fined, and "obliged to ask pardon of the court for the freedom they had taken with it."

Cotton Mather sums up the prevailing opinion of the early Anabaptists in these comprehensive words: "They are an inordinate kind of men, stirred up by the devil to the destruction of the Gospel; having neither scripture nor antiquity, nor any thing else for them, but lies and new imaginations."

Troubles never come single. In 1646, the Episcopalians in Boston—comprising several of the most respectable gentlemen of the colony, and some of whom were members of the government before the patent was transferred to New England—approached the General Court with a very courteous petition, in which they compliment the government for "its eminent gifts, continual care, and constant vigilance"—there could be no question as to the "care and vigilance"—and ask permission to publicly worship God according to the dictates of their own conscience.

This unexpected movement produced the greatest excitement, and the petitioners were at once cited to appear in person before the Court—charged with "contemptuous and seditious expressions, and were required to find sureties for their good behavior."

In November, the case came before an adjourned session of the court for final settlement, when the petitioners, having been convicted of violating "the rule of the apostle—study to be quiet and to meddle with your own business"—and reminded of "that sin of Korah, and of the near resemblance between theirs and that"—were fined respectively in sums varying from thirty to fifty pounds.

These gentlemen then determined to appeal to Parliament, and Dr. Child, one of their number, who had received the degree of Doctor of Medicine at Padua, and had been engaged for some time in studying the mineral wealth of Massachusetts, was appointed to go at once to England and prosecute their appeal there. This, however, coming to the knowledge of the

authorities, they arrested the doctor, took from him his papers, and kept him in confinement for two or three days, until the ships were gone. Mr. Winthrop complains with much sadness that, on this occasion, Dr. Child—"a man of quality, a gentleman, and a scholar," as he terms him—manifested a somewhat undue amount of passion, and "gave big words!"

Two other persons, in the mean time, Mr. Vassall and Mr. Fowle, managed to slip away, with the obnoxious papers in their pockets, and embarked for England. Just before they sailed, Mr. Cotton preached a Thursday lecture, in which he took occasion to inveigh against the enormous wickedness that must possess the man who would dare to go abroad on such an errand, and warned such of his hearers, as might be about to cross the sea, against the perils they might expect to encounter, if these seditious documents should happen to be on board the ship, adding that they would prove to be a *Jonas* to the voyage. "A storm did arise," says Mr. Blake, in his History of Boston, "and a certain woman on board, who had heard Mr. Cotton's sermon, ran about the ship in much consternation," anxious to find out if there was a *Jonas* on board. "She gave Mr. Vassall a call at midnight. He asked her why she came to him. Because, she said, it was thought he had some writings against the people of God. He told her that he had only a petition to Parliament, merely praying that they might enjoy the liberty of English subjects." She next paid Mr. Fowle a visit. He told her he had a copy of the petition, which himself and others had presented to the court at Boston; and said that, if she and others judged that to be the cause of the storm, they might have it, and do what they would with it. She took the paper to her companions, who, after consultation, decided that it should be cast overboard." It was not observed, however, that relieving the ship of this abomination was followed by any favorable change in the weather, although, after a perilous passage, she reached the shores of England in safety, where Messrs. Vassall and Fowle published the genuine papers with which they were charged, under the title, "New England's *Jonas* cast up in London."

The story of the Quakers is well known, and may be summed up in few words: In 1656, several persons belonging to this sect appeared in the streets of Boston. In a few days after their arrival they were brought before the magistrates, their books taken from them, and burned in the market-place, and the owners sent to prison. The master of the vessel that brought them to Boston was arrested, and bound over in the sum of five hundred pounds, to carry them away as soon as his ship could be got ready. At the next session of the court a law was passed, inflicting a fine of one hundred pounds upon the master of the vessel who should bring any more cargoes of this sort to the colony; for every hour's entertainment given to a Quaker, a fine of forty shillings was imposed; the Quakers themselves to be sent to prison, whipped twenty stripes, and kept to hard labor till there should be opportunity for their transportation. Additional laws were soon enacted, to the effect that a Quaker, upon the first conviction, should lose one ear; upon a second, the other ear; if the offender were a woman, in lieu of this, she was to be severely whipped; but, upon the third offence, whether man or woman, the tongue was to be bored through with a hot iron. The penalty for persistence in this creed was afterward made to be death. In accordance with this law, Mary Dyer and two others were executed on Boston Common.

In extenuation of the extreme severity with which these people were treated, it is common to cite the fact of their fanatical and outrageous violations of public order, and sometimes even of the common decencies of life. They undoubtedly said and did a great many things which would now subject one to the salutary discipline of an insane retreat; but it must be observed that the rigor of legislation preceded all these fantasies and absurdities, and was probably the provoking cause of many of their greatest outrages. Since they have ceased to be persecuted, the Quakers have settled down to a very quiet sort

of life; and, so far as we have observed, there are few classes of people in the community that excite less alarm as liable to become disturbers of the public peace.

The sharp and decisive modes adopted in Boston for the extirpation of heresy and schism would not appear so strange if it were not for the extraordinary breadth and liberality which often characterize the *preamble* of the most obnoxious and bitter statutes. We have room for only a few illustrations. In 1846 it is thus written in the records of the court: "Albeit faith be not wrought by the sword, but by the word; all persons are forbidden to reproach religion, under penalty of death."

Again: "Though no human power be lord over the faith and conscience of men, and therefore we may not constrain them to believe or profess against their conscience; yet, because such as bring in damnable heresies, tending to the subversion of the Christian faith and destruction of the souls of men, ought duly to be restrained from such monstrous impiety, it is therefore ordered that, if any Christian shall go about to subvert and destroy the Christian faith and religion, by broaching and maintaining any damnable heresy"—and then there follows a long list of dogmas, with the respective penalties affixed, in case of their denial.

Again: "Although we do not judge it meet to compel any one to enter into the fellowship of the church, nor force them to partake in its ordinances; *yet*, all persons are ordered to attend upon those ordinances, under a penalty of five pounds." The same fine is imposed upon those "who question the order of the churches."

The following statute has more consistency: "As open contempt of God's word and messengers thereof is the desolating sin of civil states and churches," all who thus offend, in various ways mentioned in the enactment, "are sentenced to stand two hours openly upon a block, four feet high, on a lecture-day, with a paper fixed on his breast, with this, A WANTON GOSPELLER, written in capital letters, that others may fear."

We might enlarge upon this department of our subject until we put our readers to sleep; but, as has been already intimated, it is a wearisome and ungracious topic, which we would be glad to pass over in silence, if fidelity to the truth of history would permit. While it is a matter of record that the settlers of the New Netherlands offered to furnish, in their territory, an asylum of retreat for the victims of religious persecution in the neighboring colony of Massachusetts, we do not quite understand why the founders of Boston, rather than the Dutchmen of New York, should be so constantly spoken of as the apostles of freedom and toleration; and, although we fully appreciate the beauty of Mrs. Hemans's delightful "Ode to the Pilgrim Fathers," in review of *all* the facts before us, we cannot, without some qualification, indorse this sentiment—

"They have left unstained what here they found—  
Freedom to worship God."

### SPRING NOTES.

THE preëminent charm of much of our modern literature lies in what is called its sentiment of Nature. The sentiment of Nature, if less productive of rich and prolonged description in the Greek than in the modern poets, is not so meagrely expressed, as our exaltation of modern descriptive writers seems to imply. The Greek idyllic poets had a more abundant sentiment of youth and of life than either Wordsworth or Rousseau—more abundant than any contemporary writer.

Celebrate Nature as we may, time and history dominate our minds; we neither feel nor think like a young people. Youth of mind seems to have gone from us. The sense of the ages, the sadness and the "riddle of the painful earth," robs our sentiment of Nature and of life of the pure pleasure and of the

unforced gladness which is so spontaneously expressed by the Greek pastoral poets. When *we* think of Nature, it is as a vast combination of exquisitely-adjusted forces; not merely as a pleasant appearance, a salutation to the eye, an object and an influence to act upon our unjaded senses.

These returning days of spring, which so sweetly enliven expectation with all the glad and tender beauty of new-born vegetation, suggest the early days of our own English literature; but their most perfect literary counterpart and expression are found in that literature which has the most of youth, and of the untroubled joy of mere life in it. In Chaucer, the spring, vivid, delicate, fresh, is admirably felt; but in Theocritus, and Bion, and Moschus it is better felt; for only in the idyls of the Greek poets does it breathe without one touch of that *conscience*, without one shadow from that *conception* which, in our literature, give us Nature plus the Christian sentiment. Bion in his seventh idyl charmingly celebrates those days which come to some of us as they came to him, as the time when "all sweet things are sweetly blossoming"—the spring "blushing with its bloom of flowers."

What season but this can give any reality to the charming fictions of "Daphnis and Chloe," of "Amaryllis," of "Thirsis," of "Hylas?" These are figures and fortunes full of the delicious and undisturbed preoccupation with love, and the tender impulses of life! these are bits of expression full of the frank praise of youth! Not elsewhere, save as a protest and labored cry, can we discover so much natural zest of, and care to enjoy, the fleeting moment; not elsewhere can we discover a spirit in perfect correspondence with Nature, which puts forth her most exquisite blooms, and, outside of the barren streets, and corrupting confinements, and repressions of great cities, solicits the natural man, who lives the life of plants and animals.

Chaucer's "April with his sweet showers" (*shours sote*); his delightful expression of this season, which "bathes every vein in such liquor of which virtue engendered is the flower;" his true and fresh observation of the sights and sounds of the awakened earth, are quaint, and curious, and natural. The ancient pastoral poets are not curious nor quaint; they are natural, charming, beautiful. Youth, the spring of life, has the supreme place in their mind; they recognize it and approve it, and solicit it; it obeys no higher impulse than that of birds; its law is to be beautiful like flowers: and the morality of its life is not more than we apply to birds and blossoms. The ancient lover of Nature and youth has no other thought, no other care, than that the good and perfect moment goes quickly by; the flower wilts; the face loses its bloom; the life loses its spring and freshness, and it becomes inert. No page of our literature so artlessly, so winningly brings before us, without foreign and often unfriendly matter, all that is characteristic of youth and Nature—in other words, gives us the sentiment of spring. It is Theocritus who speaks of girls as we would speak of flowers, when he tell us of "a bloom of maiden buds;" it is the Greek poet who spoke of the "unblown loveliness of youth." What is all this but the awakening of the mind to the palpable beauty of the first phase of life?—that life which, perfect as an *appearance*, appeals to the sense as a blossom, as a fruit, and not for a moment suggests those thoughts, or abases itself before those ideas, which darkened our natural life, and triumphed during the middle ages; forbidding our enjoyment of the *beauty* of this fair world:—the thoughts and ideas of that time, which witnessed the ascendancy of the worship of suffering, and of physical ugliness. Then withered and starved old age, macerated flesh and pale faces, were the signs of godliness and spirituality. And what a frightful and tremendous reaction from the pagan ideal of life! How far from the Greek ideal which celebrated lovely things, and for all time fixed the standard of physical beauty, and the perfection of the natural being.

Our lovers of fine phrases—and none but lovers of fine phrases should hope to express any thing of the loveliness

and significance of this season—must go closer to antiquity than our modern poets. They must pluck from the vocabulary of him who called Helen “the peerless *beauty-bud* of Greece.” If a change has come o’er the mind of man, Nature remains the same great fact, the same great life. The spring returns to us with the same mild and powerful energies, the same fragrance, the same beauty and color, as when, two centuries before Christ, the lover of Nature hailed it, and celebrated it as a part of the very life of all his fair divinities—a part of all the luminous creations of his imagination. Spring returns, but the friendly divinities are dead; the dramatic fictions with which the pagan, who lived so close to Nature, peopled his land, have gone, no more to return. Instead of gods and demi-gods, we have forces and elements—abstract terms, which satisfy the intelligence, instead of concrete figures which ravish the eye. Every thing to be investigated by the curious and restless intellect is now understood by Nature—we have lost our youth, we have entered upon man’s estate—and comparison, judgment, and inference, are the objects of our mental life. Mythology gave way to theology; now theology yields her supremacy to science. Our habits of thought have changed, but Nature renews her face after the ancient fashion. Our costumes have changed, but Nature comes with the same dress as of old. We have different beliefs and therefore different thoughts. But when the old brown earth breaks into bloom of flower, and the ploughman’s furrow ribs the soft soil, it takes very little to forget civilization and time, and, for the moment, possibly, some of us give to Nature the same homage which our race gave in the perfect days of its youth. But it is only for a moment. We have put sensation to uses not dreamed of by the artist-nature of the Greek; we have exercised our curiosity beyond any speculation of the ancient. Investigation, reflection, and comparison—the triad of our intellectual life—have taught us that Nature is our servant, not our mistress; she is a menial, and not a mysterious and radiant goddess with whom we gladly spend our youth, and who makes us dread old age, as days wholly evil and without hope.

If any contemporary could revive in our hearts the pagan’s feeling for Nature, his note would not come from great cities, but from the fields, the brooks, the woods. The streams run in music, their banks are green, and the first flowers follow the hardy grass to gem the wayside; the willow is golden in the moist meadow; the wind-flower and the crocus, all purity and delicacy, are in bloom; the distant woods have a purple mist of color, scattered over branch and twig; the first soft, faint, pure notes of color have given a flush to the face of Nature; the first sweet, clear, but faint notes, of the symphony of the seasons have just been breathed over the fields, and announce these exquisite days, which are in Nature what the pagan pastoral poets are in literature. If we were as much with Nature as they were with Nature, perhaps we should run a new furrow in the old fields of thought; we might be trite, we should be fresh. We sometimes hold pen and pencil for another purpose than mere instruction; we hold both to enliven our appreciation of Nature, and increase our zest of life. And because, as Wordsworth says, “the world is too much with us,” therefore we should welcome a fresh and sincere note from the woods and fields, and from the experience of youth. And youth and life have found no sweeter and more genuine expression than in the pagan poets, dead two thousand years ago.

### “THE PHYSICAL BASIS OF LIFE.”

THE proposition, that knowledge is progressive, is commonplace, but it nevertheless has an inexhaustible meaning. It implies successive conquests of the unknown, light behind and darkness before, and each age engaged with the definite work to which the past has brought it, and which must be ac-

complished before future questions can be reached or future victories made possible. The intellectual work of an age is far from being what that age chooses. Past results are data; past effort is training; past experience, a preparation for researches which stand next in the logic of Nature’s intellectual order. The historic epochs of inquiry are in definite sequence and intimate dependence.

In the sixteenth century men first groped round the planet, and, grasping the conception of its form, dimensions, and of people on the other side, began to form definite notions of the world they lived in. This prepared for the work of the seventeenth century, which was, to ascertain the relations of the planet to the universe, and to determine the laws of motion in the heavens and on the earth, by which the foundations of physical science were laid. From the aspect of the universe in its vastness, and the properties of masses of matter, the eighteenth century passed to the study of nature in the opposite extreme of minuteness—to the inner constitution and composition of material things, and the establishment of the science of chemistry. The discipline and results of physical inquiry, the art of experimenting, and the slow perfection of implements of research, were preliminary to the more subtle and refined investigation into atomic and molecular phenomena.

With this scientific apprenticeship of three hundred years, the nineteenth century passes on, and enters upon the investigation of the great problem of life. The pioneering minds of the world are now absorbed in biological inquiries. Columbus before Newton, Newton before Lavoisier, and Lavoisier before Cuvier, Liebig, and Darwin, symbolize the sequence of discovery and indicate the problems that predominate in our own time. While physical and chemical inquiries are still pursued with greater intensity than ever, they have opened the gates of a still loftier research into the conditions and laws of life, the nature of life, and the origin of life.

Nor is this last stage of thought a fruitless or a hopeless one. The men of science of each era have been discredited by the mass of their contemporaries as pursuers of futile aims, and, although the majestic fabric of solid knowledge which they have reared attests their success, there are those still to whom the past teaches nothing, and who talk of the present predominant aims of science as chimerical and impossible. And yet, at no period and in no department of investigation has scientific progress been more rapid and sure than in the field of biology in the present century.

An excellent illustration, both of the advancement which has been made in this direction and of the general interest which is felt in this class of subjects, is furnished by Professor Huxley’s recent lecture on “The Physical Basis of Life,” and the reception it has met with. Several editions have been called for and issued, both in England and in this country, and it has aroused a great deal of curiosity, commendation, and criticism. A statement of the essential or more strictly biological portion of his argument will probably be acceptable to many of our readers. The understanding of it may perhaps be facilitated by a few words of explanation in regard to the attitude or conditions of the question.

When the microscope had reached a certain stage of perfection, a few years ago, it was discovered that all living creatures, plants, and animals, from the lowest to the highest, were made up of exceedingly minute bodies called cells, each of which has a power of growth, reproduction, and decay, as truly as the most complex and developed being. It was supposed that, in discovering these amazingly minute microscopical structures, we had gone to the very bottom of the phenomena of life; but further examination has shown that this conclusion is erroneous. In the first place, it has been found that there are organic structures which are neither themselves cellular nor derived from cells, and in the next place there is a material of life lower still in the vital scale, and out of which all cells are constructed. Every form of organic structure is

elaborated out of a common and universal material which is known in science under the name of *protoplasm*, and it is this which Professor Huxley terms the physical basis of life. The present view regarding cells and their relation to the primitive substance from which they spring is thus clearly stated by Mr. Herbert Spencer, in his "Principles of Biology:" "The doctrine that all organisms are built up of cells, or that cells are the elements out of which every tissue is developed, is but approximately true. There are living forms of which cellular structure cannot be asserted; and in living forms that are, for the most part, cellular, there are, nevertheless, certain portions which are not produced by the metamorphosis of cells. Supposing that they were the only material available for building, the proposition that all houses are built of bricks would have about the same relation to the truth as does the proposition that all organisms are composed of cells. This generalization respecting houses would be open to two criticisms: first, that certain houses, of a primitive kind, are formed, not out of bricks, but out of un-moulded clay; and second, that, though other houses consist mainly of bricks, yet their chimney-pots, drain-pipes, and ridge-tiles, do not result from combinations or metamorphosis of bricks, but are made directly of the original clay; and of like natures are the criticisms which must be passed on the generalization that cells are the morphological (structural) units of organisms. To continue the simile, the truth turns out to be that the primitive clay or protoplasm out of which organisms are built may be moulded directly, or with various degrees of indirectness, into organic structures."

Protoplasm consists of the four chemical elements, carbon, oxygen, hydrogen, and nitrogen, which also compose the bulk of the entire organic world. These elements are united in very complex union, the nature of which has never been determined with exactness. It is albumenoid in aspect, that is, like white of egg. A few years ago, the term *protein* was applied to a combination of these four elements, which was supposed to be the common basis of all albumenoid substances, but no such principle has ever been separated or proved to exist. The term, however, is still retained, though with what vagueness may be inferred from the statement of Professor Frankland, that so-called protein has probably more than a thousand isometric forms.

Professor Huxley aims to show that, as between protoplasm and all the developed forms of life there is an acknowledged unity of *composition*, so there is also a unity of *power* and *form*.

First, as regards unity of powers, by what property is it manifested in the higher forms of life? By transitory changes of parts, which are due to the property of *contractility*. The power of movement in all the animal grades resolves itself into this: "Even those manifestations of intellect, of feeling, and of will, which we rightly name the higher faculties, are not excluded from this classification, inasmuch as (to every one but the subject of them) they are known only as transitory changes in the relative positions of different parts of the body. Speech, gesture, and every other form of human action, are, in the long run, resolvable into muscular contractions."

But this property of contractility is also manifested in plants, and in protoplasm itself. "So far as the conditions of the manifestation of the phenomena of contractility have yet been studied, they are the same for the plant as for the animal. Heat and electric shocks influence both and in the same way, though it may be in different degrees. It is by no means my intention to suggest that there is no difference in faculty between the lowest plant and the highest, or between plants and animals. But the difference between the powers of the lowest plant or animal and the highest is one of degree, not of kind, and depends, as Milne-Edward long ago so well pointed out, upon the extent to which the division of labor is carried out in the living economy."

The following graphic passages present a vivid picture of the extent and regularity of protoplasmic movements:

"I am not now alluding to such phenomena, at once rare and conspicuous, as those exhibited by the leaflets of the sensitive-plant, or the stamens of the barberry, but to much more widely-spread, and, at the same time, more subtle and hidden, manifestations of vegetable contractility. You are doubtless aware that the common nettle owes its stinging property to the innumerable stiff and needle-like, though exquisitely delicate, hairs which cover its surface. Each stinging-needle tapers from a broad base to a slender summit, which, though rounded at the end, is of such microscopic fineness that it readily penetrates, and breaks off in, the skin. The whole hair consists of a very delicate outer case of wood, closely applied to the inner surface of which is a layer of semi-fluid matter, full of innumerable granules of extreme minuteness. This semi-fluid lining is protoplasm, which thus constitutes a kind of bag, full of a limpid liquid, and roughly corresponding in form with the interior of the hair which it fills. When viewed with a sufficiently high magnifying power, the protoplasmic layer of the nettle-hair is seen to be in a condition of unceasing activity. Local contractions of the whole thickness of its substance pass slowly and gradually from point to point, and give rise to the appearance of progressive waves, just as the bending of successive stalks of corn by a breeze produces the apparent billows of a corn-field.

"But, in addition to these movements and independently of them, the granules are driven, in relatively rapid streams, through channels in the protoplasm which seem to have a considerable amount of persistence. Most commonly, the currents in adjacent parts of the protoplasm take similar directions; and, thus, there is a general stream up one side of the hair and down the other. But this does not prevent the existence of partial currents which take different routes; and, sometimes, trains of granules may be seen coursing swiftly in opposite directions, within a twenty-thousandth of an inch of one another; while, occasionally, opposite streams come into direct collision, and, after a longer or shorter struggle, one predominates. The cause of these currents seems to lie in contractions of the protoplasm, which bounds the channels in which they flow, but which are so minute that the best microscopes show only their effects, and not themselves.

"The spectacle afforded by the wonderful energies prisoned within the compass of the microscopic hair of a plant, which we commonly regard as a merely passive organism, is not easily forgotten by one who has watched its display, continued hour after hour, without pause or sign of weakening. The possible complexity of many other organic forms, seemingly as simple as the protoplasm of the nettle, dawns upon one; and the comparison of such a protoplasm to a body with an internal circulation, which has been put forward by an eminent physiologist, loses much of its startling character. Currents similar to those of the hairs of the nettle have been observed in a great multitude of very different plants, and weighty authorities have suggested that they probably occur, in more or less perfection, in all young vegetable cells. If such be the case, the wonderful noonday silence of a tropical forest is, after all, due only to the dulness of our hearing; and could our ears catch the murmur of these tiny maelstroms, as they whirl in the innumerable myriads of living cells which constitute each tree, we should be stunned, as with the roar of a great city."

There is, however, this fundamental difference between plants and animals; that while plants can manufacture fresh protoplasm out of mineral elements, animals, on the other hand, are obliged to procure it ready made and in the long run depend upon plants. "With this qualification it may be truly said that the acts of all living things are fundamentally one."

But this unity is not limited to action; Mr. Huxley maintains that it extends also to *form*:

"If a drop of blood be drawn by pricking one's finger, and viewed with proper precautions and under a sufficiently high microscopic power, there will be seen, among the innumerable multitude of little, circular, discoidal bodies, or corpuscles, which float in it and give it its color, a comparatively small number of colorless corpuscles, of somewhat larger size and very irregular shape. If the drop of blood be kept at the temperature of the body, these colorless corpuscles will be seen to exhibit a marvellous activity, changing their forms with great rapidity, drawing in and thrusting out prolongations of their substance, and creeping about as if they were independent organisms.

"The substance, which is thus active, is a mass of protoplasm, and its activity differs in detail, rather than in principle, from that of the protoplasm of the nettle. Under sundry circumstances the corpuscle dies and becomes distended into a round mass, in the midst of which is seen a smaller spherical body, which existed, but was more or less hidden, in the living corpuscle, and is called its *nucleus*. Corpuscles of essentially similar structure are to be found in the skin, in the lining of the mouth, and scattered through the whole framework of the body. Nay, more; in the earliest condition of the human organism, in that state in which it has but just become distinguishable from the egg in which it arises, it has nothing but an aggregation of such corpuscles, and every organ of the body was, once, no more than such an aggregation.

"Thus a nucleated mass of protoplasm turns out to be what may be termed the structural unit of the human body. As a matter of fact, the body, in its earliest state, is a mere multiple of such units; and, in its perfect condition, it is a multiple of such units, variously modified.

"But does the formula which expresses the essential structural character of the highest animal cover all the rest, as the statement of its powers and faculties covered that of all others? Very nearly. Beast and fowl, reptile and fish, mollusk, worm, and polype, are all composed of structural units of the same character, namely, masses of protoplasm with a nucleus. There are sundry very low animals, each of which, structurally, is a mere colorless blood-corpuscle, leading an independent life. But, at the very bottom of the animal scale, even this simplicity becomes simplified, and all the phenomena of life are manifested by a particle of protoplasm without a nucleus. Nor are such organisms insignificant by reason of their want of complexity. It is a fair question whether the protoplasm of those simplest forms of life, which people an immense extent of the bottom of the sea, would not outweigh that of all the higher living beings which inhabit the land put together. And in ancient times, no less than at the present day, such living beings as these have been the greatest of rock-builders.

"What has been said of the animal world, is no less true of plants. Embedded in the protoplasm at the broad, or attached, end of the nettle-hair, there lies a spheroidal nucleus. Careful examination further proves that the whole substance of the nettle is made up of a repetition of such masses of nucleated protoplasm, each contained in a wooden case, which is modified in form, sometimes into a woody fibre, sometimes into a duct or spiral vessel, sometimes into a pollen-grain, or an ovule. Traced back to its earliest state, the nettle arises as the man does, in a particle of nucleated protoplasm. And in the lowest plants, as in the lowest animals, a single mass of such protoplasm may constitute the whole plant, or the protoplasm may exist without a nucleus.

"Under these circumstances, it may well be asked, How is one mass of non-nucleated protoplasm to be distinguished from another? Why call one 'plant' and the other 'animal'?"

"The only reply is that, so far as form is concerned, plants and animals are not separable, and that, in many cases, it is a mere matter of convention whether we call a given organism an animal or a plant. There is a living body called *Bdhalium septicum*, which appears upon decaying vegetable substances, and in one of its forms is common upon the surfaces of tan-pits. In this condition it is, to all intents and purposes, a fungus, and formerly was always regarded as such; but the remarkable investigations of De Bary have shown that, in another condition, the *Bdhalium* is an actively locomotive creature, and takes in solid matters, upon which, apparently, it feeds, thus exhibiting the most characteristic feature of animality. Is this a plant? or is it an animal? Is it both? or is it neither? Some decide in favor of the last supposition, and establish an intermediate kingdom, a sort of biological No-Man's Land for all these questionable forms. But, as it is admittedly impossible to draw any distinct boundary-line between this no-man's land and the vegetable-world on the one hand, or the animal on the other, it appears to me that this proceeding merely doubles the difficulty which, before, was single.

"Protoplasm, simple or nucleated, is the formal basis of all life. It is the clay of the potter, which, bake it and paint it as he will, remains clay, separated by artifice, and not by nature, from the commonest brick or sun-dried clod."

The transformations of protoplasm, in their practical aspect, are thus neatly illustrated by the Professor:

"In the wonderful story of the '*Peau de Chagrin*,' the hero becomes possessed of a magical wild ass's skin, which yields him the means of gratifying all his wishes. But its surface represents the duration of the proprietor's life; and for every satisfied desire the skin shrinks in proportion to the intensity of fruition, until at length life and the last hand-breadth of the *peau de chagrin* disappear with the gratification of a last wish.

"Balzac's studies had led him over a wide range of thought and speculation, and his shadowing forth of physiological truth in this strange story may have been intentional. At any rate, the matter of life is a veritable *peau de chagrin*, and for every vital act it is somewhat the smaller. All work implies waste, and the work of life results, directly or indirectly, in the waste of protoplasm.

"Every word uttered by a speaker costs him some physical loss; and, in the strictest sense, he burns that others may have light—so much eloquence, so much of his body resolved into carbonic acid, water, and urea. It is clear that this process of expenditure cannot go on forever. But, happily, the protoplasmic *peau de chagrin* differs from Balzac in its capacity of being repaired, and brought back to its full size, after every exertion.

"For example, this present lecture, whatever its intellectual worth to you, has a certain physical value to me, which is, conceivably, expressible by the number of grains of protoplasm and other bodily substance wasted in maintaining my vital processes during its delivery. My *peau de chagrin* will be distinctly smaller at the end of the discourse than it was at the beginning. By-and-by, I shall probably have recourse to the substance commonly called mutton, for the purpose of stretching it back to its original size. Now, this mutton was once the living protoplasm, more or less modified, of another animal—a sheep. As I shall eat it, it is the same matter altered, not only by death, but by exposure to sundry artificial operations in the process of cooking.

"But these changes, whatever be their extent, have not rendered it incompetent to resume its old functions as matter of life. A singular inward laboratory which I possess will dissolve a certain portion of the modified protoplasm; the solution so formed will pass into my veins; and the subtle influences to which it will then be subjected will convert the dead protoplasm into living protoplasm, and transubstantiate sheep into man.

"Nor is this all. If digestion were a thing to be trifled with, I might sup upon a lobster, and the matter of life of the crustacean would undergo the same wonderful metamorphosis into humanity. And, were I to return to my own place by sea, and undergo shipwreck, the crustacea might, and probably would, return the compliment, and demonstrate our common nature by turning my protoplasm into living lobster. Or, if nothing better were to be had, I might supply my wants with mere bread, and I should find the protoplasm of the wheat-plant to be convertible into man, with no more trouble than that of the sheep, and with far less, I fancy, than that of the lobster."

## CASTLE GARDEN AND NEW YORK BAY.

THE readers of the JOURNAL will find, with the present number, a cartoon affording a panoramic view of the Bay of New York, and of Castle Garden. Castle Garden derives its name from the fact that, after its duties as a fortification had ceased, it was converted into a public saloon, or garden, so called. At a later day it served as a concert-room and theatre, but is now employed as a depot for immigrants, and as the headquarters of the Commissioners of Emigration. That vast tide of Germans, Irish, Italians, and other peoples, that annually land on our shores, for the greater part enter our continent through the portals of Castle Garden. The illustration shows a barge, heavily laden with immigrants, just towed from a ship at anchor in the bay, and discharging its living freight.

The point of view selected by the artist is a long pier projecting into the North River, where the spectator has at his left, in the foreground, the old, crumbling, picturesque "Castle," with "Governor's Island" and Fort Columbus in the middle distance, and the shores of Staten Island at his right. The harbor is broad and comprehensive, where the war and commercial marine of the world can find protection. Miniature

steamers and ferry-boats, Mercuries of the wave, are threading the open water, or hiding away in the hundred protected landing-places of the broken shore. Great ships lie at anchor, their bows polished and worn by the sea, their sails, as if from fatigue, flapping nerveless against the sky-sweeping masts. Huge dark hulls, great monsters indeed, are belching forth smoke from iron chimney-stacks, and moving on in straight lines with the seeming impulse of fate. Yachts, unrivalled in speed and beauty, are flashing their white wings in the sunshine. The gay packets of the lordly Hudson and charming Connecticut are sweeping along, crowded with living, hopeful beings. The whole scene is one of brilliant life and bustle.

"Old Castle Garden," which stands out at the foot of the island as if to watch all that enters the gate of the harbor, although now so dilapidated and worn, is a place of no little interest. In the dreamy olden times of our Holland ancestors, the foundations of this dismantled fort were innumerable bowlders, stained with seaweed and salt, lying beyond the main-land, and known as the Whitehall rocks. Upon them, more than two centuries ago, was perched a rude fortification, and a consequent demand was made for land enough, immediately adjoining, to afford a parade-ground and a place whereon to erect the commandants' houses; and thus, in time, was originated "the Battery," for so many generations of such significance to native-born New-Yorkers. The existing structure, which occupies so prominent a place in our cartoon, was erected to meet the exigencies of "the War of 1812," but no enemy invaded our harbor, and a hostile shot was never fired from its walls.

### THE HACK-DRIVERS OF PARIS.

SOME years ago, I drove to the *Quartier Latin* with a friend and fellow-countryman of mine, in a Paris hackney-coach. He had never visited the French capital before, and intrusted himself entirely to my guidance. As we were alighting in the vicinity of the Sorbonne, our driver remarked that he had frequently, in former years, enjoyed the honor of serving one of the most celebrated German *savants*, to wit, Alexander von Humboldt. "He often rode in my coach to see M. François Arago," said the man, while handing us our change. "They were intimate friends, and I, more than once, had the pleasure of seeing them together in my hack."

"Alexander von Humboldt died some months ago," said my companion.

"Death does not spare even the immortals," replied the driver, and then added, "*Pulvis et umbra sumus*" (we are but dust and shadows).

"Ah! you understand Latin?" I queried.

"I have not forgotten my Horace," he rejoined, with a sad smile, and, lifting his eyes, gave a flourish with his whip, and drove away.

My friend stood there in a quandary. "I have heard so much said about the ignorance of the French masses," he exclaimed, "and here the first Parisian hack-driver I come across has a classical education! How does that come?"

I thereupon endeavored to solve the problem by relating what follows: In Paris there are more than six thousand hack-drivers, and among them are not only men who have ridden in elegant equipages, but also ex-professors, jurists, notaries, artists, priests, etc.—in fine, persons who innocently have been cast down, by some sudden change of fortune, from the pinnacle of prosperity and social position to the depths of want; or with whom stern Themis had a crow to pick, or who had atoned for some weak moment with years of meditation behind bolts and bars. The thick veil that hides their past history is never lifted. When they apply to the hackney-coach guild for employment, they are called upon to prove merely their skill as coachmen, and make a deposit of two hundred francs as a guarantee for the livery furnished them, and for the payment of any fine that the police might subsequently impose upon them for some misdemeanor. Whether previously guilty or not, they are all carefully watched, and are overtaken with speedy punishment so soon as any charge is sustained against them.

The hack-drivers of Paris are very shrewd folk, and strive, above all things, to continue on a good footing with the police. When they have in any wise offended the guardians of public order, they at once endeavor to get back into their good graces, either by bringing such articles as may have been left by passengers in their hacks to the prefecture, or by informing them of any suspicious conversation that they may have overheard among their customers. It is, therefore, very imprudent to express one's self freely on political topics in the presence of any of this class.

The Parisian hack-driver gets four francs per day from the association, and for that sum must render sixteen hours of service. It is true that his hard lot is alleviated by gratuities from customers, and these gratuities, or contributions of "drink-money," are often very considerable. The driver who conveys a party of young people home from a merry-making is sure to get a handsome remembrance. It sometimes happens that he picks up a foreign prince, who has his reasons for avoiding recognition, and is rewarded with something really worth while. Many a king and emperor has ridden through Paris in a simple hackney-coach with a view to remain *incognito*. But the Paris hackmen are sharp-sighted observers. They have studied so many countenances that they seldom err in their judgment of their customers. They are perfectly aware, for instance, when they are conveying a jealous passenger who wants to take the object of his jealousy by surprise, and therefore stimulates him to hasten his pace under promise of a good extra fare; or the lover who is fearful of missing the propitious hour; or the fugitive bankrupt who, to escape pursuit, is anxious to reach the railway station, and thence make his way over the frontier. Such passengers pay liberally for the time they gain.

In addition to these extra services, the hackmen not infrequently resort to more questionable profits, such as conveying passengers in remote parts of the city without returning the proceeds to the society. A system of control, sufficiently vigorous and ubiquitous to render all this petty swindling impossible, has not yet been devised, in spite of every scheme and invention that could be brought to bear upon it. Nevertheless, these pilferings seldom occur without ruinous consequences to the guilty parties, and for the following reason: There are individuals in Paris who make good the defective measures resorted to by the society to hold the hackmen in surveillance. Their method of accomplishing this purpose is cunning, if not very kind. They engage a hack, and, when they have reached the end of their trip, pay their fare and drink-money like other customers, but take care to immediately inform the managers of the hack association that they, at such and such an hour, drove by such and such a route to such and such a point, and, at the same time, accurately state the kind of money with which they paid the driver. A few days later, they repair to the office of the managers and are there handed the amount disbursed, as a recompense for their information. This voluntary espionage has become a regular business, and hangs over the heads of the hackmen like the sword of Damocles. The slyest hack-driver in Paris has continually before his eyes the danger of picking up a still slyer customer, who may give him his gratuity with a pleasant smile, only to ruin him afterward, should circumstances point that way.

### TABLE-TALK.

IT is curious to note the different lines taken by some authors at different periods of their lives, and the unexpected ways in which they break out. Horace Greeley began his career as editor of a literary weekly (*The New-Yorker*), something like the *Round Table*. Hope, the English banker, famous for his wealth and learning, his ugly face and his handsome wife, after writing some heavy books about armor and furniture, suddenly produced "*Anastasius*," and founded the school of Oriental romance, a school now extinct, but which had great vogue in its day. And now M. Ernest Feydeau—*Fanny Feydeau*, as he has been called—the author of some of the most daring and disagreeable novels in the whole range of French literature, has broken ground as an art-critic, and comes forward as editor of the *International Review of Art and Curious Objects*—for thus we suppose we must translate *curiosité*—"objects of bigotry and virtue," as Mrs. Railway-King Hudson was said to have called them, though we suspect the Joe is much older than she.

This monthly review is handsomely gotten up, and appears to be specially adapted to the wants of amateurs and collectors.

The pedantry of employing technical and scientific words unnecessarily has often been blamed and ridiculed. But the present prevailing fashion of pedantry is rather to give uncouth forms to recognized historical names, under pretence of an accuracy seldom required and often fictitious. One of the commonest illustrations of this propensity is the substitution of Greek for Roman letters in classic Greek names, e. g., *Sokrates* for Socrates, which is really about as reasonable as *katekhism* for catechism would be. Some English periodicals, especially the *Saturday Review*, have lately adapted the same course with old English, French, and German names. It is hard to say what is gained by writing *Egbeht* and *Knut* for Egbert and Canute; and when it comes to presenting our old friends the Merovingians in the guise of *Merwings*, the thing is carried too far, and the writer seems to be purposely puzzling and aggravating the reader. A very liberally educated man may well be excused for not recognizing the *Merwings* immediately. Such writing certainly lacks one quality of good writing—it repels rather than attracts readers. It is altogether too much in the “hate the profane vulgar, and keep them off” style, which might do very well for Horace and his little knot of courtier patrons, but is decidedly unsuited for the present age. Better the purism of Macaulay, who always called the great French King *Lewis XIV.*, and carefully translated the name of every Parisian street and square which he had occasion to mention in his history.

An Italian journalist, quoting from an English newspaper the trial of a brute of the Bill Sykes species, who had murdered his wife with a poker, innocently added, “We do not know if this poker (*questo pokero*) be a domestic utensil or a surgical instrument.” The French have found out, in one sense, what *questo pokero* is. The game of poker, or, as they call it, *pokkair* (the accent very strong on the second syllable), is one of the most fashionable at the most fashionable clubs of Paris. Its introduction was peculiar, and involves a certain moral. In the first years of the present empire, the vice of gambling at the clubs had reached such a height, and in particular so many very young men had been fleeced, that the police felt compelled to interfere, and threatened to close some of the *cercles*. Games of chance were therefore prohibited by the clubs, and to avoid mistake, as the term was liable to different constructions, the several games of chance were formally enumerated, such as *lansquenet*, *baccarat*, *écarté*, etc., etc. At this juncture appeared, like “gods out of the machine,” some Americans, or Frenchmen who had been in America, with *pokkair*, which, *not being in the official list*, was, of course, not prohibited by club rules. We believe that *pokkair* and *kerres cobblair* (*American* sherry cobbler) are the only republican institutions that have gained a footing under the second French empire.

The lecture of Professor Huxley on “The Physical Basis of Life,” which has lately made such a ripple in the world of thought, and which has carried the *Fortnightly Review*, that contained it, to the sixth edition, was sent, by the author, to this journal in advance of all other publication, but the unexpected delay of our issue prevented us from using it upon its first appearance. We give copious extracts from it, with some accompanying observations, in this week’s JOURNAL, and, in accordance with the plan of our publication, shall follow it by the productions of other able men in this interesting field of inquiry. As we have shown in another place, the leading scientific men of all nations are working with great assiduity upon biological questions; while the results of investigation into the mysteries of life are not only the most attractive, but they take us “where we live,” and come home with the force

of truths which interpret to us our own nature. We have received from Professor Foster, of University College, London, one of the most accomplished of European physiologists, the first of a series of lectures before the Royal Institution of Great Britain, on “The Involuntary Movements of Animals,” which will appear next week. These lectures are clear, fresh, brilliant, original in illustration, and contain much new matter that will be read with interest by all classes.

It is curious how some people reason. Forgetting that the art of judgment consists in estimating the influence of *all* the causes which conspire to produce an effect, they fix attention upon a single cause, and, if that is shown to be inadequate to the whole effect, they deny it to be a cause at all. When it is claimed, for example, that fish diet, from its unusual amount of phosphatic constituents, is especially favorable to brain-nutrition, and, therefore, promotive of intellectual action, it is immediately asked why fishermen are not philosophers, and why civilization did not first arise among the fish-eating Pacific Islanders. For the simple reason that intellectual development is not due to one cause, but to the coöperation of many causes. Granting that a piscatory diet is favorable to nervous nutrition (which we now neither affirm nor deny), and that it is, therefore, a veritable cause, it would certainly be a very funny world if exclusive fish-eating could turn an amphibious Otahaitan into a Newton. We intimated the other day that there is a relation between the state of the air respired and the quality of the accompanying thought—that oxygenated blood being the prime condition of intellectual action, the perfection of the process must favor the highest action of the brain, and therefore the most difficult of the mental operations. Whereupon, it is asked, if this theory is good for any thing, why are Indians, hunters, and those who live always in the open air, so mentally dull, while those who inhabit ill-ventilated rooms in cities do so much excellent intellectual work? The answer is the same. For, in asserting that this is an *actual* cause, we by no means assume that it is the *sole* cause of intellectual results. Man is a very complex being, and his actions are influenced by a great number of agencies, all of which must conspire to produce the highest effect of which his nature is capable—original or creative intellectual action. These agencies must be individualized in thought, and each attended to; but it is a very faulty logic which supposes that any one of them is adequate to the total result.

Among the numerous advantages of a better scientific education will be the correction of errors of this kind, and the cultivation of better habits of reasoning.

The difference between the heroes of the comedy of to-day and those of the comedy of the last century exhibits clearly and forcibly the change that has come over the time. It has been said, when speaking of our great-grandfathers, that those who drank port-wine thought port-wine. Certainly, a rich, crusty flavor—a mellow, broad heartiness—that characterized the last century, has disappeared; and there is substituted instead a very thin, acid form of humanity, which, to the generous unction of the old time, is what claret is to port. But our recent comedy—accepting the mission of comedy to be what Shakespeare described it, “to show the age and body of the time, its form and pressure”—awakens us to another change in our social life. The spirit of the old comedy was its hearty, almost boisterous, mirth, its supreme and untroubled gayety. As distinguished from this, the merriest humors of the new comedy are partially cynical; if there is a laugh, it is the laugh of satiety, of the *blasé*; or, at best, the mirth is that of the philosopher who, discovering the vanity of all things, is merry with a sort of pitiful disdain. Our latest comedy, moreover—of which Robertson’s “School” is an example—is reticent; it has the repose of the Vere de Veres; it is nonchalant, indifferent,

epicurean. Its motto is, "*Nil admirari*." Its love-making and its heroism are alike—both cool and slightly scornful. It reflects accurately the age; and, just as we find no rollicking mirth, no abounding spirits, no ripe and eager zest in the heroes of the mock life before the foot-lights, neither do we find them in the real life of the men and women around us. Mirable, or Rover, or Doricourt, with their huge exhilaration, their glorious spirits, their superb animality, are possible only in a past existence and a past art. Gayety is eclipsed. We are all turned speculators, and thinkers, and students, and economists. We are indifferent to almost every thing but the spirit of criticism; we are fastidious, cynical, hypercritical; we affect taste, and yet our manners are as negative as our spirits, and we have utterly outgrown the magnificent suavity of the old school. We may well sometimes wish that our modern life could catch a little of the warmth and lusty abandon of a hundred years ago; but it cannot be. Each age has its own type of character.

### Foreign Notes.

MOST of the books at the sale of the library of the late Emperor Maximilian of Mexico were bought by a Brussels agent for the library of the Empress Carlotta, who is at the present time engaged in writing a History of the Mexican Empire. Despite the mental disease of the poor lady, her work is said to be an exceedingly able and interesting one. At times the empress seems to be entirely in her right mind, and, for several days, nothing will occur indicative of her disease. But at other times she refuses to touch any food, and abstains entirely from her wonted literary labor, working herself up to a high state of excitement, weeping, sobbing, and tearing her hair. On such occasions, no one is able to prevail upon her to eat any thing, except the Queen of Belgium, who succeeds in inducing her to do so only by partaking of every morsel of food which the unfortunate ex-empress raises to her lips.

Richard Wagner, the great German composer, who is his own librettist, composes the texts of his operas, most of which possess considerable value as poems, with wonderful rapidity. He is said to have written the text of his famous "*Tannhäuser*" in less than four days. The young French writer, who translated "*Tannhäuser*" into French under Wagner's personal supervision, said that his energies as a worker had never been more severely taxed than when he had taken that arduous task upon himself. Wagner writes and composes, as a general thing, not less than sixteen hours daily, and his manuscript contains few or no corrections.

Mr. Ernest Keil, of Leipsic, the publisher of the *Gartenlaube*, who has made an enormous fortune out of that popular periodical, was, not many years ago, a very poor bookseller's clerk. He has managed his paper with consummate ability, and it has now the largest circulation of any journal published on the European continent. The *Daheim*, the most successful of the rivals of the *Gartenlaube*, and which, at one time, seemed likely to outstrip it in the race for popularity, has recently lost much of its original vigor, and its circulation is said to be decreasing.

How great the popularity of Thiers's "*History of the Consulate and Empire*" is, may be inferred from the fact that, since the first appearance of the great work, no fewer than 117,000 sets of the expensive illustrated edition have been sold. In Belgium, besides, before the international copyright had been adopted, 75,000 copies of the cheap reprint were sold; and one publisher in Germany has sold 50,000 copies of the German translation of the work.

Both Queen Isabella and her husband, the King-consort Don Francis, had, in Madrid, private librarians, but no libraries. In fact, except a few missals, not a book of any description was found in the Alcazar, the royal palace of Madrid, when the revolutionary authorities took possession of it on the night of the 13th of September. The above-mentioned private librarians were, moreover, very illiterate men.

Ivan Tourgueneff, the greatest of living Russian romancists, who for twenty years past has resided in his villa near Baden, is a tall old gentleman, with a dense white beard. His daughter translates all his books into French, and a cousin of his prepares the German translations, so that all of his novels are published simultaneously in three languages.

Professors Bunsen and Kirchhoff, whose discovery of the spectral analysis created so great a sensation in the scientific world a few years since, have obtained new results, of a rather startling character, by following up their researches in that direction. They will shortly publish another work on the subject.

Eleven thousand dollars have been realized by the sale of the private library of the Archduke Maximilian. Most of the books containing marginal notes in the handwriting of the unfortunate prince had been removed from the library, by order of the Emperor Francis Joseph.

Mr. Alexander Wallace, of Colchester, England, has published a treatise on the culture of the yamamai, or Japanese silk-worm, being an account of the trials and difficulties encountered in reproducing the worm, from a few eggs secretly procured from Japan, and transmitted to Europe. This remarkable species of silk-worm feeds on the leaves of the common oak.

An English journal allows itself to speak of Mr. Bright "as arrogant and offensive in private society, incapable of comprehending a joke, and even probably harsh and overbearing in his own home."

The Mormons have in London 104 elders, 38 priests, 23 teachers, and 30 deacons—always hard at work. With them there are 915 members. Mormonism, although originating in this country, is clearly not an American institution, its recruits coming almost entirely from abroad.

"*Dreams*," by Mr. Robertson, whose comedies of "*Caste*" and "*School*" have been the most marked of recent dramatic successes, has proved a failure in London. Mr. Tom Taylor's comedy of "*Won by a Head*" has also been a failure. Tennyson's "*Lady Clara Vere de Vere*" supplied the outline of the plot for "*Dreams*."

An English ritualistic curate purchased a coffin for the purpose of simulating the death, burial, and resurrection of our Saviour by entombing himself from Good-Friday until Easter. His vicar heard of it, and prevented the absurdity.

The American principle of light wheels for vehicles seems likely to gain introduction into England. An English firm of coach-builders announce that they are prepared to build light carriages on wheels imported from America.

Geneva is said to be suffering from an epidemic of strikes, the most serious being by those in the building and printing trades. New York has been suffering from like cause in the same classes.

Mr. Hepworth Dixon denies that, in his "*Spiritual Wives*," he made his pictures of "free love" as samples of American religious life, but as peculiar, though exceptional, phases of that life.

Among the papers of Charles Ritter, the celebrated German geographer, several unpublished essays of considerable value have been found by a Berlin *savant*. They will probably be published some time next fall.

The works of Alexis de Tocqueville continue to have a steady sale in France. Five thousand copies of his "*Democracy in America*" are annually disposed of.

Berthold Auerbach has by far the largest income of German novelists. Next to him comes Gutzkow. Spielhagen and Fritz Reuter also receive large copyrights.

Victor Hugo has no more ardent admirer than the royal family of Holland. The King of the Netherlands has repeatedly urged the great poet to take up his residence either at the Hague or at Amsterdam.

A Danish translation of "*L'Homme qui Rit*" is shortly to be published in the columns of the Copenhagen *Dagbladet*. Mr. Oscar Goldsmidt is the translator.

The King of Sweden is said to write nearly every day a poem. In publishing them, however, he takes extreme care to winnow the grain from the chaff.

Mr. A. C. Asbjørnsen, of Christiania, announces a Norwegian translation of Bryant's poems.

### The Museum.

IN "*Sketches of Early Life in Boston*," published in our third number, we learn that persons leaving home without leave were fined. It seems that Thomas More, in his "*Utopia*," seemed to consider a regulation of this sort highly desirable in a perfectly-organized community. He says: "But if any be desirous to visit either their friends dwelling in an other citie, or to see the place it selfe; they easilie obteyne licence of their Siphograutes and Tranibores, onlesse there be some profitable let. No man goeth out alone, but a companie is sente furth, together with their princes letters, which do testifie that they have licence to go that journey, and prescribeth also the day of their returne."

There was a curious old custom at Highgate, a place out of London, of swearing all travellers on the horns. In the great coaching days, when travellers to London from the north stopped at Highgate, at whichever of its nineteen public houses it might be, out came the horns, fixed on a pole, and the passengers were sworn to eat no brown bread when they could get white, unless they liked it better; and not to kiss the maid when they could kiss the mistress, unless they liked her better. They were then inducted into all the liberties of the place. If they saw a swine lying in the gutter, they were free to lie down by it, if they chose; and much more nonsense, no doubt thought very dull by the poor, freezing coach-travellers, who, with stamping toes and blue noses, had been facing the icy blast for days and nights together.

It has been calculated that some of the stars seen with Lord Rosse's telescope shine from such an enormous distance, that light takes upward of 50,000 years in travelling to us from them. Now consider for a moment the flight of a light-ray from a star at this distance on one side of our system to another as far off on the opposite side. For 100,000 years the light speeds onward—each second sweeping over nearly 200,000 miles; past stars and systems it rushes on, but far away, on every hand, are stars and other systems to which it comes not near. During 3,000 generations of mortal men—if one can conceive that our race could last out that time—the pulsations of the ether are transmitted along the tremendous line which separates the two stars. Yet, during all that time—if we are to accept the opinion of those who hold that our earth is the only inhabited world—the onward-rushing light never approaches a single spot where sentient beings are to be found, save one tiny globe, around which it could circle eight times in one of the seconds which make up the vast period of its flight.—*St. Paul's Magazine*.

The Chinese are as peculiar in their customs as they are in their features and their dress. It is not alone the oblique eyes and the pig-tails, that mark the Chinamen. One of their customs is a mark of love and respect for the dead, and seems to us a far more sensible thing than the superstition of the Hindoos in burning the bodies of their widows upon the funeral pyre, or that of the western Indians in slaying horses over the graves of the dead, or that of the African negroes in killing prisoners for the same purpose. The Chinese make light frames of bamboo in the shape of horses, oxen, temples, houses, or any thing they may wish the dead person to possess in the world of shades. Then they parade the streets with these, accompanied with music and lighted lanterns; the processions are usually at night. Finally they halt, and there are prostrations and reverences before these

"Swearing at Highgate."

frames, which have been made gay and beautiful by covering them with bright-colored paper. The torch is then applied, and the departed friend or relative is supposed to become possessed of whatever was thus burned in effigy. The cost of this is from five to twenty-five dollars, and occasionally hundreds, for great men.

It is claimed that no other country in the world has such natural advantages for the growth, cultivation, and manufacture of silk as California possesses. Large tracts of land are now being planted with mulberry-trees. In Los Angeles alone nearly a million cuttings have been planted. In San Gabriel, near Los Angeles, a Mr. Hall is laying out a veritable

silk-town. A portion of a ranch is laid out in lots of forty acres each, and subdivided into portions of ten acres, of which sales are made to those only who will devote themselves to silk-culture. The purity of the mulberry-leaf grown in California is well known.

## PARFUMERIE RIGAUD & CIE., PARIS.

It is respectfully announced to the world of fashion and elegance, that RIGAUD & CIE., of Paris, are the only importers and manufacturers, in Europe, of the genuine YLANG-YLANG, and that the Soaps, Pomades, Oil, Cosmetics, Face and Toilet Powders, also the perfumes for the handkerchief,

### EXTRACT OF YLANG-YLANG,

AND

### MANILLA BOUQUET,

Are only genuine when signed thus,

Or bearing our Trade Mark,

A BRANCH OF  
YLANG-YLANG.

*Rigaud & Cie.*

### ASK FOR RIGAUD'S PERFUMERY.

Sold only by first-class Druggists and Fancy Goods Dealers throughout the United States and other parts of the world.

SPECIAL REPRESENTATIVE,

CLIFFORD J. BALLYN,  
53 Murray St., New York.

## APPLETONS' ANNUAL CYCLOPÆDIA

FOR 1868.

READY MAY 15th.

This book, as a record of the important events of the past year, is the best, and in fact the only, authority on all matters relating to the material and intellectual development of the year, embracing *POLITICAL, CIVIL, MILITARY, and SOCIAL AFFAIRS* of ALL COUNTRIES; Important Public Documents, Biography, Statistics, Commerce, Finance, Literature, Science, Agriculture, Mechanical Industry, etc.

The London *Saturday Review*, notorious for its sharp criticisms, and its disposition to find fault, is pleased to say of the "American Annual Cyclopædia," published by D. Appleton & Co., that it "is the most complete and convenient work of reference, for recent history, for the political events of the last few years, for the various features of social, commercial, industrial, and scientific progress, that has yet come under our notice, or, we believe, that has been published."

**WANTED.**—Experienced Agents wanted in all parts of the country to sell this important work.

D. APPLETON & CO., Publishers, New York.

Entered, according to Act of Congress, in the year 1869, by D. APPLETON & CO., in the Clerk's Office of the District Court of the United States for the Southern District of New York.

No. 8.—WITH SUPPLEMENT.]

SATURDAY, MAY 22, 1869.

[PRICE TEN CENTS.]

## THE MAN WHO LAUGHS; OR, BY THE KING'S COMMAND.

BY VICTOR HUGO.

### IX.

HATE IS AS STRONG AS LOVE.

QUEEN ANNE had around her several of these low voices. Barkilphedro was one of them.

Besides the queen, he worked upon, influenced, and slyly tampered with Lady Josiane and Lord David. We have said already that he whispered into three ears—one ear more than Dangeau. Dangeau only whispered into two, in the days when, thrusting his head between Louis XIV., smitten with Henrietta, his sister-in-law, and Henrietta, smitten with her brother-in-law, Louis XIV.—Louis's secretary known to Henrietta, and Henrietta's unknown to Louis—placed in the very midst of a love-affair between two puppets, he made up both the questions and the answers.

Barkilphedro was so cheerful, so ready to take any thing up, so incapable of undertaking the defence of any thing whatsoever, so little devoted at heart, so ugly, so vicious, that it was in the very nature of things that a royal personage should scarcely notice how to do without him. When Anne had tasted of Barkilphedro, she cared not for any other flatterer. He flattered her, as they flattered Louis the Great, by stinging some one else. The king, being ignorant, says Madame de Montchevreuil, one is compelled to scoff at the learned.

To drop poison into the puncture, from time to time, is the acme of art. Nero likes to see Locusta at work.

Royal palaces are extremely penetrable; the madrepore corals have an inner passage-way easily guessed at, made practicable, and at need scooped out by the gnawing insect termed a courtier. A pretext for entry sufficed. Barkilphedro—having for pretext his commission—was, in a very short time, with the queen, what he was with the Duchess Josiane, the indispensable domestic animal. An expression that he ventured to drop one day let him at once into the queen's secrets; he learned how much to depend upon her Majesty's goodness. The queen was much attached to her lord-steward, William Cavendish, Duke of Devonshire, who was extremely weak-minded. This nobleman, who had taken all the degrees at Oxford, and did

not understand orthography, was simpleton enough to die, one fine morning. To die, at court, is the height of imprudence, for no one troubles himself to speak any more of you. The queen, Barkilphedro being present, was lamenting the event, and concluded by exclaiming, with a sigh:

— It is a pity that so many virtues should have been borne and served by so poor an intelligence.

— God may have wished to have his ass! murmured Barkilphedro, in low tone and in French.

The queen smiled. Barkilphedro made a note of this smile.

He drew the conclusion: To bite ticks.

His malicious wit had leave to sally forth.

From this day forward, he thrust his curiosity everywhere; his malignity also. He was allowed to have his way, so much was he feared. He who makes the king laugh makes the rest tremble.

He was a potent wag.

Every day he took a further step in advance, under ground. There was need of Barkilphedro. Several great men so far honored him with their confidence, as to charge him, on occasion, with scandalous commissions.

The court is like gear. Barkilphedro became its motive power. Have you noticed in certain machinery how small is the regulating wheel?

Josiane, in particular, who made use, as we have pointed out, of Barkilphedro's talents as a spy, had so much confidence in him, that she did not hesitate to put into his hands one of the secret keys of her suite of rooms, by means of which he could enter them at any hour. This excessive laying open of private life was a fashion in the seventeenth century, and was called giving the key. Josiane had given two of these confidential keys; Lord David had one, Barkilphedro had another.

Besides, to penetrate abruptly into bedrooms was by no means an uncommon practice in the olden style. Thence incidents. La Ferté, drawing aside suddenly the curtains of Mademoiselle Lafont's bed, found Sainson there, the Black Musketeer, etc., etc.

Barkilphedro excelled in making these sly discoveries, that subordinate and bring down the great to the little. His tread in the shade was tortuous, soft, and knowing. Like every perfect spy, he was made up of the executioner's severity and of the patience of the microscopist. He was a born courtier. Every courtier is a night-walker. The courtier prowls about in that sort of night, which may be called omnipotence. He has a dark lantern in his hand. He throws light upon any chosen point, and remains himself in the dark. What he

\* Entered, according to Act of Congress, in the year 1869, by D. APPLETON & CO., in the Clerk's Office of the District Court of the United States for the Southern District of New York.

seeks with this lantern is not a man; it is a beast. What he finds is the king.

Kings do not like any pretension to being great, in those about them. Sarcasm, on all but themselves, charms them. The talent of Barkilphedro consisted in a perpetual lessening of lords and princes, to the profit of royal majesty, itself by so much exalted.

The secret key, held by Barkilphedro, was a double one, shaped differently at either end, so as to open the private apartments at Josiane's two favorite residences, Hunkerville House in London, and Corleone Lodge at Windsor. These two buildings formed a portion of the Clancharlie inheritance. Hunkerville House was close to Old-Gate. Old-Gate, in London, was an entrance by which you approached from Harwich, and where was seen a statue of Charles II. having over his head an angel painted, and under his feet a lion and a unicorn sculptured. From Hunkerville House, with an easterly wind, might be heard the chimes of St. Marylebone. Corleone Lodge was a Florentine palace, in brick and stone, with marble colonnades, built on pile-work at Windsor, at the extremity of the wooden bridge, and having one of the most splendid courts of honor in England.

In this latter palace, very near Windsor Castle, Josiane was within easy reach of the Queen. Josiane was partial to it, notwithstanding.

Next to nothing outwardly—altogether rooted within—such was Barkilphedro's influence over the queen. Nothing more difficult than to tear up these court-weeds; they strike deep, and offer no external grasp. To pluck up Roquelaure, Triboulet, or Brummel, is almost impossible.

From day to day, and more and more, Anne relished Barkilphedro.

Sarah Jennings is famous; Barkilphedro is unknown. His favor lay hidden. The very name, Barkilphedro, has not reached history. All the moles are not caught by the mole-catcher.

Barkilphedro, formerly a candidate for orders, had studied every thing a little; whatever is skimmed over gives for result—nothing. One may be a victim of the *omnis res scibilis*. To have under their craniums the cask of the Danaides is the misfortune of a whole race of the learned, which we may term the sterile. What Barkilphedro had put into his head-piece had left it empty.

The mind, like Nature, abhors a vacuum. In the vacuum, Nature plants love; the mind, not unfrequently, puts hate therein. Hate fills up.

Hate, for hate's sake, exists. Art, for art's sake, is in nature, more than is believed.

A man hates. He must, in fact, be doing something.

Gratuitous hate, how formidable a term! This is as much as to say, the hate that is its own reward.

The bear lives by licking his paw.

Indefinitely? No. The paw must be revictualled. There must be something put underneath it.

To hate indistinctly is soothing, and suffices for some time; but in the end there must be an object. Animosity, spread over all creation, exhausts, as does any solitary delight. Hate without object is like shooting without a mark. What makes the sport interesting is a heart to pierce.

One can't hate, solely for the honor of it. There must be a seasoning—a man, a woman, some one to ruin.

This service, of giving interest to the game, of offering an aim, of envenoming hate by concentrating it, of amusing the sportsman with a sight of his living prey, of causing the watcher to anticipate the warm and smoking bubbles of the blood that is about to flow, of cheering the bird-catcher with the lark's credulity winged in vain, of being a creature hatched unawares, to be murdered by intelligence—this delicate and horrible service, of which he who renders it is not conscious, did Josiane render to Barkilphedro.

Thought is a projectile. Barkilphedro, from the first day,

had set himself to taking aim at Josiane with the evil intentions that were in his mind. An intention and a carbine are alike. Barkilphedro held his pointed, directing against the duchess all his secret malignity. Does this astonish you? What has the bird that you fire at done to you? It is to eat him, say you. The same with Barkilphedro.

Josiane could hardly be hit in the heart; the spot that is an enigma is vulnerable with difficulty. But she could be reached through her head, that is to say her pride.

It was on this side that she thought herself strong, and that she was weak.

Barkilphedro had taken account of it.

If Josiane had been able to see clearly into the night of Barkilphedro, if she had been able to distinguish what there was in ambush behind that smile, this proud personage, so loftily placed, would probably have trembled. Happily for the tranquillity of her slumbers, she was utterly ignorant as to what there was in the man.

Things unexpected fuse together, one knows not how. The deep underlyings of life are formidable. There is no small hate. Hate is always enormous. It preserves its stature in the tiniest being, and remains a monster. A hatred is all possible hatred. An elephant, hated by an emmet, is in peril.

Even before striking, Barkilphedro experienced with delight the savor of the evil deed that he desired to effect. He did not, so far, know precisely what he would do against Josiane. But he was determined to do something. Such a resolution taken was much to start with.

To annihilate Josiane would have been too great a success. He did not hope for it. But to humiliate her, to dwindle her down, to harass her, to reddon those superb eyes with tears of rage—this would be partial success. He reckoned on it. Tenacious, credulous, faithful in torturing any one else, not to be uprooted from his purpose, Nature had not thus constituted him for nothing. He well understood how to find a flaw in Josiane's golden armor, and how to cause the blood of this Olympian woman to trickle. What advantage, let us insist, was there for him herein? An immense advantage. Returning evil for good.

What is an envious person? An ungrateful one. He detests the light that shines upon and warms him. Zoilus hates this boon—Homer.

To make Josiane undergo what would in these days be called a vivisection; to have her, all palpitating, upon the anatomical table; to dissect her alive, leisurely, in a surgery somewhere; as an amateur, to cut her in pieces while she howled—this dream had its charm for Barkilphedro.

To reach this result, it might be necessary to suffer a little, which he would find all right. You may pinch yourself with the pincers. The knife, in straightening itself, may cut your fingers. What matters it? To be entangled slightly in Josiane's torture would have been all the same to him. The executioner, handling the red-hot iron, has his little part in the burning, and never heeds it. So that the other one suffer more, you feel nothing. To see the victim writhing takes away your own pain.

Do what injures, happen what may!

Planning harm for other people is complicated with the acceptance of a dubious responsibility. You risk yourself in the danger to which you subject another, in proportion as the linking together of all things may bring about an unexpected collapse. This does not hold back your true evil-doer. He experiences in joy what the patient undergoes in agony. He is tickled by this laceration. The bad man only expands himself amid horrors. Torture reacts upon him in self-satisfaction. The Duke of Alba warmed his hands at the pile. The fireside, anguish; its reflected light, pleasure. That such transpositions should be possible makes one shiver. Our dark side may not be sounded. Exquisite torment—the expression is in Bodin (book iv., page 196)—has perhaps this triple and terrible mean-

ing: research in the torture, suffering of the tortured, enjoyment of the torturer. Ambition, appetite—the words signify one sacrificed to another satisfied. How sad, that hope can be thus wayward! To owe any one a grudge is to wish him ill. Why not good? Can it be that the main leaning of our will is to the side of evil? One of the hardest tasks of the just is to eradicate unceasingly from the soul the malevolence that is almost inexhaustible. Nearly all our longings, when probed, embody what is not avowed. For the thoroughly wicked—and this hideous perfection exists—"so much the worse for the others!" signifies "so much the better for me!" Shade of man! Hollow places!

Josiane had the fulness of security, conferred by ignorant pride, and made up of contempt for every thing. The feminine faculty for disdaining is remarkable. A disdain, unconscious, involuntary, and confiding—of such was Josiane. Barkilphedro, for her, was little more than a thing. She would have been greatly astonished, if she had been told that Barkilphedro really had an existence.

She went, she came, she laughed, before this man, who looked at her out of the corner of his eye.

He, thoughtful on his part, was watching his opportunity.

In proportion as he waited, his determination to throw something of hopelessness into the life of this woman augmented.

Inexorable lying in wait!

Besides, he gave himself excellent reasons. It is a mistake to suppose that rogues are devoid of self-esteem. They give account of themselves to themselves in lofty monologues, and pitch their tone extremely high. What! This Josiane had given him alms! She had crumbled upon him, as upon a mendicant, some farthings out of her colossal fortune. She had riveted and nailed him to an idiotic function. Yes, he, Barkilphedro, almost a man of the church, of capacity varied and profound, a learned personage, having in him the stuff for a reverend, he was employed to register bits of broken glass, fit for scraping off Job's pustules. If he passed his life in a miserable hole of a record-office, gravely uncorking stupid bottles, encrusted with all the impurities of the sea, and deciphering mouldy parchments, the snout of conjuring-books, the filth of wills, and one knows not what of illegible twaddle, it was all the fault of this Josiane! What! The creature absolutely *thee'd* and *thou'd* him!

And he was not to avenge himself!

And he was not to pupish this sort of thing!

Just as if! Why, there would be no more justice then here below!

## X.

FLAMINGS THAT WOULD BE SEEN, IF MAN WERE TRANSPARENT.

WHAT! this woman—this mad-cap, this lascivious dreamer, virgin for the nonce, this morsel of flesh that has not yet yielded itself, this impertinence in princely coronet, this Diana through pride, not yet snapped up by the first comer—for lack of a chance, as they say, and I agree to it—this bastard of a riff-raff of a king who hadn't the wit to keep his place, this duchess of a lucky hit, who, being a grand dame, played the goddess, and who, if poor, would have been on the town; this lady almost, this thief of an exile's possessions, this imperious beggar, because, one day, he, Barkilphedro, had nothing for his dinner and was without a resting-place, had the impudence to seat him at one end of her own table, and to nestle him in some hole or other of her insupportable palace. Where was it? No matter where; perhaps in the garret, perhaps in the cellar. What's the difference? a little better off than the valets; a little worse off than the horses! She had taken advantage of his distress—his, Barkilphedro's, and hastened to render him a service traitorously, which is what the rich do by way of humiliating, and of attaching the poor to themselves, like terriers that are led in a leash! Besides, what did the service cost her? A service is worth its price. She had more than enough of rooms in her house! Come to the aid of Bar-

kilphedro, indeed! A grand effort it was for her! Had she eaten a spoonful the less of turtle-soup? Had she denied herself any thing whatever, in her hateful superfluities? No; she had added to the superfluities a bit of vanity, an object of luxury, a good action for a feather in her cap, a man of wit succored, a clergyman patronized! She could put on airs and say: "I lavish benefits; I give the men of letters something to peck; I become their patroness. Isn't he lucky to have found me, this poor wretch? What a friend of the arts I am!" And all for having prepared, in a villanous hole, a cot-bed under the framework of the roof! And for his place at the Admiralty, Barkilphedro was indebted to Josiane for that. Zounds! a famous post! Josiane had made Barkilphedro what he was. She had created him; so be it. Yes, created nothing, less than nothing; for he felt himself, in this ridiculous office, bent down, stiffened in his joints, and disfigured. What did he owe to Josiane? The gratitude of the hunchback to his mother, who made him deformed. Look at the privileged, these heaped-up people, these new-comers, these favorites of that hideous step-mother, Fortune! And the man of talent, the Barkilphedro, was forced to range himself on the staircases, to bow to the lackeys, to climb in the evening up a heap of stories, and to be courteous, assiduous, gracious, deferential, and agreeable, and to wear always on his muzzle a respectful grimace, as though there were no cause for grinding the teeth with rage. And all this time she was stringing pearls about her neck, and playing the lover's part with her lout of a Lord David Dirry-Moir, the hussy!

Never permit yourself to have a service done you. Advantage will be taken of it. Don't let yourself be caught in the very act of inanition. Somebody would console you. Because he was starving, this woman had made it a pretext for giving him something to eat. Thenceforward he was her domestic servant! A break-down in the stomach, and then you are in chains for life. To be obliged, is to be made the most of. The fortunate, the powerful, profit by the moment when you stretch out the hand, to put a penny into it, and from that minute of your weakness to make you a slave, and a slave of the worst sort, a slave of charity, a slave compelled to love! What infamy! What indelicacy! What a surprise sprung upon your pride! And all is over; there you are, condemned for life to find this man good and that woman handsome, to remain a second-rate subaltern, to approve, to applaud, to admire, to offer incense, to bow yourself down, to garnish your kneepans with corns from kneeling, to sugar your words when you are devoured with rage, when you are stifling cries of fury, and when you have within you more of wild upheaving and bitter spume than the ocean.

It is thus that the rich make prisoners of the poor.

This glue of the good deed wrought upon you smears you, and throws you into the mire forever.

An alms is without remedy. Gratitude is equivalent to paralysis. A benefaction has a sticky adhesiveness, and cramps your free movements. These odious beings, opulent and sordid, whose pity has borne hard upon you, are aware of the fact. It is settled. You belong to them. They have bought you. For how much? For a bone, that they have snatched back from their dog, to offer it to you. They have thrown this bone at your head. You have been stoned as much as succored. It is all the same. Have you gnawed the bone? yes or no? You also have your part in the dog's scrap-box. Then, give thanks! give thanks forever! Adore your masters! Indefinite genuflection! The benefit implies your acceptance of a recognized inferiority. They require that you should feel yourself to be a poor devil, and that you should feel that they are gods. Your dwindling swells them up. Your bending down straightens them up. There is, in the very tone of their voice, a soft but impertinent inflection. Their family affairs, their marriages, their baptisms, their women about to be confined, the little ones that they have—

these are your concern. Let a wolf's cub be born to them; well, you must compose a sonnet. You are poet, merely to be a rhymester. If this is not enough to make the stars tumble down! A little more, and they would make you use their old shoes!

—What is it that you have there at home, my dear? How ugly he is! What in the world is that man?—I don't know; it's a raw scribbler whom I support. Thus do these geese discourse; and without lowering their voices. You hear; and you remain mechanically amiable. Beyond this, if you are ill, your masters send you a doctor. Not their own. At need, they ask after you. Not being of the same species as yourself, and being inaccessible when so it pleases them, they are affable. Their escarpment makes them approachable. They know that a plain footing is out of the question. By force of contempt, they are polite. At table, they make you a little sign of the head. Sometimes they know how to spell your name. They make you realize that they are your patrons, only by treading ingenuously upon all that is in you of susceptible and delicate. With what consideration they treat you!

Is this sufficiently detestable?

Assuredly it was urgent that Josiane should be chastised. She must be taught with whom she had to do. Ah! my wealthy gentlemen—because you are unable to consume every thing; because opulence might end in indigestion, in view of the smallness of your stomachs, which are of the same size as ours, after all; because it is better worth while to distribute the scraps than to lose them—you get up this porridge of leavings, and throw it, magnificently, to the poor! Ah! you give us bread, you give us lodging, you give us clothes, you give us an office, and you push audacity, madness, cruelty, folly, and absurdity, to the extent of believing that we are your most obliged! This bread—it is the bread of servitude; this lodging—it is the valet's garret; these clothes—they are a livery; this office—it is a mockery, remunerated it may be, but brutalizing! Ah! you fancy that you have the right to blight us with your lodging and your nourishment; you imagine that we are your debtors; and you reckon upon our gratitude! Well, then, we will eat you out of house and home! Well, then, we will rip out your entrails, fair dame; and we will devour you all alive; and we will sunder your heartstrings with our teeth!

This Josiane! Was it not outrageous? What merit did she possess? She had accomplished the master-stroke of coming into the world—a witness to her father's folly and her mother's shame. She did us the honor to exist. And this complaisance on her part, in being a public scandal, was rewarded with millions; she had estates and country-seats, warrens, preserves, lakes, forests—what all do I know? And, with that, she played the fool, and had verses addressed to her, while he, Barkilphedro, who had studied and worked, who had taken pains, who had stuffed his eyes and his brains with big books, who had matured in old treatises and in science, who had an immensity of intelligence, who could command armies with success, who could write, if he pleased, such tragedies as *Otway's* and *Dryden's*, he, who was made to be an emperor, he had been reduced to permitting this nothing at all to save him from dying of hunger. Can the usurpation of the rich, those execrable elect of chance, be carried further, making pretence to be generous with us, and to protect us, and to smile on us—us who would drink their blood, and would lick our lips afterward? That the low woman of the court should have the odious ability to be a benefactress, and that the superior man should be condemned to pick up such leavings fallen from such a hand—what could be more frightfully iniquitous? And what a society must it be, that has, to this extent, a basis of disproportion and injustice! Is not this a case of seizing every thing by the four corners, and of tossing up pell-mell to the ceiling the table-cloth, and the banquet, and the orgy, and the tippling, and the drunkenness, and the guests, and those who are leaning their two elbows on the table, and those who

are on all-fours underneath it, and the insolent who give, and the idiots who accept, and of spitting back every thing to the nose of the Deity, and of pitching the whole earth at heaven! In the mean while, let us dig our claws into Josiane.

Thus dreamed Barkilphedro. These were the bellowings of his inner soul. It is the practice of the envious man to absolve himself, by amalgamating with his own personal grievance the public ill. All the savage forms of malevolent passion came and went in this fierce intelligence. At the corner of old maps of the world, of the fifteenth century, may be noted a large, blank space, without form and without name, whereon these three words are inscribed: *Hic sunt leones*. This sombre corner has existence also in man. The passions prowl round and mutter, somewhere within us; and it may be said also of one dark spot in our souls: "Here are lions."

This scaffolding of fallow reasonings, was it absolutely absurd? Was it wanting in a certain judgment? It must be owned, not.

It is fearful to think that this something within us, the judgment, is not justice. The judgment is the relative. Justice is the unreasoning. Reflect on the difference between a judge and a just man.

Evil-doers abuse the conscience, with authority. The false has its gymnastics. A sophist is a forger; and, on occasion, this forger brutalizes common sense. A certain logic, very supple, very implacable, and very nimble, is at the service of evil, and excels in stabbing truth in the dark. These blows are sinister fisticuffs of Satan against God!

Such a sophist, admired by simpletons, has no other glory, than that of having given an occasional pinch to the human conscience.

The trouble was, that Barkilphedro foresaw a miscarriage. He was undertaking a vast labor, and he feared, at least, that not enough scath would come out of it. To be a man of corrosive disposition, to have in one's self a will of steel, a diamond hate, an ardent longing for the catastrophe, and to burn nothing, to decapitate nothing, to exterminate nothing! To be what he was, a devastating power, a voracious animosity, a gnawer of others' happiness; to have been created—for there is a creator, the devil or God, no matter which—to have been created in all particulars Barkilphedro, and only, perhaps, to realize a filip; is this possible? Barkilphedro to miss his stroke! To be a machine for launching forth fragments of rock, and to expend all his expulsive force in raising a bump on the forehead of a conceited woman! A catapult causing only the havoc of a pair of shears! Accomplish the task of Sisyphus for the result of an ant! Sweat out all hate, for next to nothing! Is this sufficiently humiliating, when one is in one's self a hostile mechanism, capable of pulverizing the world? Put in movement all one's gear, give rise, in the background, to the hubbub of the machinery of Marly, to succeed, perhaps, in pinching the tip of a little rose-colored finger! He was about to turn over and over huge blocks, just to wrinkle a little the flattened surface of the court! Heaven has this mania for expending power on a grand scale. This upheaval of a mountain results in displacing a molehill.

Besides, given the court, a queer place for action, nothing is more dangerous than to take aim at one's enemy, and miss him. In the first place, this unmasks you to your enemy, and this is irritating; in the next place and above all, this is displeasing to the master. Kings have small relish for clumsy fellows. No contusions; no ugly fisticuffing! Cut every one's throat; but don't make any one's nose bleed! Who kills is a proficient; who wounds is a ninny. Kings don't like to have their servants lamed. They owe you a grudge, if you fracture a bit of porcelain on their mantel-piece, or a courtier in their train. The court ought to remain unstained. Break, and replace. That's well enough.

This also agrees perfectly with the taste for backbiting, common to princes. Speak ill; don't do ill! Or if you do it, let it be on a large scale!

Stab, but don't scratch!—unless the pin be poisoned. An extenuating circumstance. This, let it be recalled, was the case with Barkilphedro.

Every pigmy charged with hate is the phial, wherein was enclosed the dragon of Solomon. Microscopic phial, immeasurable dragon! Formidable condensation, awaiting the gigantic hour of release! Wearisomeness consoled by thought of the pending explosion! What is contained is larger than that which contains it. A latent giant, how strange a thing! A tick wherein there is a hydra! To be this fearful spring-box, to hold Leviathan within one, this, for the dwarf, is at once a torment and a delight.

Nothing, moreover, would have induced Barkilphedro to loose his hold. He awaited his hour. Would it come? What matter?—he awaited it! When one is far gone in evil, self-love comes into play. It is interesting to sap and mine a court-fortune above ourselves, and to do it at all risks and perils, however deep-seated and close-hidden it may be. One becomes impassioned over such a game. One comes to doting on it, as on an epic poem that one is composing. To be very small, and to attack one very great, is a brilliant affair. There is something fine in being a flea upon a lion.

The proud beast feels itself stung, and dispenses its prodigious anger upon the atom. Meeting a tiger would trouble him less. And note how the parts are changed! The humiliated lion has in his flesh the insect's sting; and the flea may say: "I have in me the blood of the lion!"

However, this would but half appease the pride of Barkilphedro. Consolations. Palliatives. To tease is something; to torture is more desirable. Barkilphedro—unpleasant idea, that continually recurred to him—would, probably, have no other success, than to inflict a pitiful scratch upon Josiane's epidermis. What could he hope for more, he so low, and she so radiant? A scratch, what a trifle is it to him who craves all the purple hue of a flaying alive, and the screechings of the woman worse than naked—having no longer that chemise, her skin! With such longings, how grievous is it to be impotent! Alas! there is nothing perfect!

In short, he became resigned. Unable to do more, he dreamed only the half of his dream. After all, it was an object to accomplish a sombre farce.

What a man is he, who takes revenge for a benefit done him! Barkilphedro was this colossus. For the most part, ingratitude is but forgetfulness; for the high graduates in evil, it partakes of fury. The ungrateful clown is full of ashes. With what was Barkilphedro filled up? With a furnace—furnace walled in, of hate, of anger, of silence, of spite, awaiting Josiane for fuel. Never had a man so abhorred a woman, without grounds for it. How terrible a fact! She was his sleeplessness, his preoccupation, his wearisomeness, his rage.

Possibly, he was somewhat in love with her.

## XI.

### BARKILPHEDRO IN AMBUSH.

To find the vulnerable point of Josiane and strike her there, such was, for the several reasons we have just given, the unshaken purpose of Barkilphedro.

The intention was not sufficient; it was necessary to find out the way.

What method was to be taken?

This was the question.

Vulgar vagabonds very carefully lay out the programme of the villany they desire to commit. They do not feel strong enough to seize the passing incident, take possession of it by will or by force, and constrain it to their service. Hence the preliminary combinations that deep rogues disdain. Deep rogues take all their villany *a priori*; they content themselves with arming at all points, prepare various weapons for various cases, and, like Barkilphedro, simply watch for the

opportunity. They know that any plan constructed in anticipation runs the risk of dovetailing badly into the circumstances that will present themselves. In that way one does not become master of what may be the situation, and make of it what one wishes. There is no such thing as holding a preliminary parley with destiny. To-morrow does not obey us. Fortune shows a certain disregard of discipline.

So they watch the chance of challenging her coöperation without preamble, without authority, and on the spot. No plan, no diagram, no geometrical outline, no ready-made shoe badly fitting the unexpected. They dive head foremost into crime. The turning to immediate and rapid account whatever incident may assist him, this is the cleverness that distinguishes the villain of ability, and lifts the rogue to the dignity of a demon. To bully fortune, this is genius.

The true villain strikes you as from a sling, with the first pebble that comes to hand.

Capable scoundrels count on the unforeseen, that stupefied accomplice in so many crimes.

To seize hold of an incident, to leap upon it—there is no art other than this. Art poetic for this kind of talent.

And, meantime, to know whom one has to deal with. To examine the ground.

Barkilphedro's ground was Queen Anne.

Barkilphedro was getting nearer to the queen.

So near, that, sometimes, he fancied he heard her Majesty's soliloquies.

Sometimes he took part, unheeded, in the conversations of the two sisters. It was not forbidden him to slip in a word. He took advantage of this to make himself of little account. Mode of inspiring confidence.

Thus it was that one day at Hampton Court, in the garden, being behind the duchess, who was behind the queen, he heard Anne, conforming awkwardly to the fashion, let fall some apothegms.

—The brutes are happy, said the queen; they are in no danger of going to hell.

—They are there, replied Josiane.

This reply, which rudely put philosophy in the place of religion, was displeasing. If by chance it had been profound, Anne would have felt shocked.

—My dear, said she to Josiane, we talk of hell like two idiots. Let us ask Barkilphedro what is there. He ought to know these things.

—As a devil? asked Josiane.

—As a brute, replied Barkilphedro. And he bowed.

—Madam, said the queen to Josiane, he has more wit than we have.

With a man like Barkilphedro, to get near the queen was to get a hold upon her. He could say, I have her. Meanwhile it was necessary to discover the way of turning it to account.

He had a footing at court. It was a fine thing to have a point of observation. No opportunity could escape him. More than once he had drawn a smile from the queen, that betrayed her. It was like having a license for shooting.

But were there no royal preserves? This license for shooting, did it extend to breaking a wing or a paw of such a creature as the own sister of her Majesty?

First point to be cleared up. Did the queen love her sister? A blunder might lose all. Barkilphedro watched.

Before commencing the game, the player looks at his cards; what trumps has he? Barkilphedro began by considering the ages of the two women. Josiane, twenty-three years; Anne, forty-one years. This was well. He had his cue.

The moment when a woman ceases to count her springs, and begins to count her winters, is trying to the temper. Impotent rancor against time which one has in one's self. The blooming young beauties, fragrance to others, are thorns to you, and every rose gives you a prick. You fancy that all this freshness is taken from you, and that loveliness dwindles in your-

selves because it increases in others. To work this secret ill-humor, to deepen the wrinkles of a woman of forty who is queen, this was evidently Barkilphedro's policy.

Envy surpasses in exciting jealousy, as a rat in bringing out a crocodile.

Barkilphedro fixed upon Queen Anne his masterly attention.

He saw into the queen as one sees into stagnation. The marsh has its transparency. In dirty water one sees vices; in troubled water one sees follies. Anne was only troubled water.

Thoughts in embryo and ideas in larva moved about in that fatuous brain.

They were somewhat indistinct. They hardly had outlines. They were realities, nevertheless, though unformed. The queen imagined this. The queen desired that. Precisely what, it was difficult to determine. The confused transformations that take place in stagnant water are not easy to study.

The queen, habitually dull, had at times her sallies, stupid and abrupt as these were. It was in these that it was necessary to seize her. She should be taken in the act.

Did Queen Anne, in her heart, wish well or ill to the Duchess Josiane?

Problem. Barkilphedro proposed it to himself.

This problem solved, one might go further.

• Several accidents served Barkilphedro. And especially his closeness of watch.

Anne was, on her husband's side, distantly related to the new Queen of Prussia, wife of a king of a hundred chamberlains, of whom she possessed a portrait painted in enamel after the process of Turquet of Mayence. This Queen of Prussia had, herself also, a younger illegitimate sister, the Baroness Drika.

One day, Barkilphedro being present, Anne asked the Prussian ambassador some questions about this Drika.

- They say she is rich?
- Very rich, replied the ambassador.
- Has she palaces?
- More magnificent ones than those of the queen her sister.
- Who is to marry her?
- A very great personage, the Count Gormo.
- Is he good-looking?
- Charming.
- Is she young?
- Quite young.
- As handsome as the queen?
- The ambassador lowered his voice and answered,
- Handsomer.
- What an impertinent! murmured Barkilphedro.
- The queen, after a short silence, exclaimed:
- These bastards!

Barkilphedro made a note of this plural.

At another time, in going out of the chapel where Barkilphedro had been in attendance near the queen's person, behind the two grooms of the almoner, Lord David Dirry-Moir, crossing before some rows of women, created a sensation by his fine appearance. As he moved along, there broke out an applause of feminine voices—How elegant he is!—What a fine fellow!—What a noble air he has!—How handsome he is!

— How disagreeable all this is! grumbled the queen.

Barkilphedro heard.

He had made up his mind.

One might injure the duchess, without offending the queen.

The first problem was solved.

But the second presented itself.

How should this mischief to the duchess be done?

What resource did his wretched employment afford him for an end so difficult?

• None, undeniably.

## XII.

### SCOTLAND, IRELAND, AND ENGLAND.

Let us note one little circumstance: Josiane "had the turning-box."

This will be understood upon reflecting that she was, although in a left-handed way, sister of the queen, that is to say, a princely person.

"To have the turning-box." What is that?

The Viscount St. John—say Bolingbroke—wrote to Thomas Lennard, Earl of Sussex: "Two things constitute greatness—in England, to have the turning-box; in France, to have the *For*."

The *For* in France was this. When the king travelled, the forerunner of the court, every evening, at the resting-places on the way, assigned their lodgings to the persons in attendance on his Majesty. Among these people, some enjoyed an immense privilege. "They had the *For*," says the *Historical Journal* for the year 1694, page 6, "that is to say, the forerunner who assigned these lodgings put *For* before the name, as *For the Prince of Soubise*; instead of which, when he set apart the lodging of one who was not a prince, he did not put the *For*, but simply the name; for example: *The Duke of Gervais, The Duke of Mazarin*, etc." This *For* over a door indicated a prince, or a favorite. Favorite was worse than prince. The king accorded the *For*, as he did the Blue Ribbon or the peerage.

"To have the turning-box" in England was less flattering to one's vanity, but of more importance. It indicated the actual coming in contact with the person of the reigning sovereign. Whoever was, by birth or favor, in a position to receive communications direct from majesty, had on the wall of his or her bedroom a turning-box to which was attached a bell. The bell sounded, the box opened, a royal letter appeared on a gold plate or velvet cushion, then the box closed again. This was secret and solemn. The mysterious in the familiar. The turning-box served no other purpose. Its bell-ringing announced a royal message. One did not see who brought it. After all, it was only the king's or the queen's page. Leicester "had the turning-box" under Elizabeth, and Buckingham under James I. Josiane had it under Anne, although little of a favorite.

It was not an enviable distinction. The privilege involved greater servility. One was by it a little more of a valet. At court, promotion is degradation. "Avoir le tour"—they employed the words in French: this detail of English etiquette being probably an old French absurdity.

Lady Josiane, a virgin peeress, as Elizabeth was a virgin queen, led, sometimes in town, sometimes in the country, according to season, a semi-princely life, and held almost a court, at which Lord David was a courtier, with many others. Not being yet married, Lord David and Lady Josiane might without ridicule show themselves in public together, as they did freely. They frequently went to the play and to the races in the same carriage, and occupied the same box. The marriage, which had been permitted them, and even enjoined upon them, chilled them. But on the whole, the charm was in seeing each other. The familiarities permitted to engaged couples have a boundary that is easily passed. They held back from it—what is easy being in bad taste.

The bravest boxing-matches of that time took place at Lambeth, the parish in which the Lord Archbishop of Canterbury has a palace, albeit the air there is noxious, and where a fine library is open at certain hours to honest people. Once, it was in winter, there was held there, in a meadow fenced in and locked with a key, a mill between two men, at which Josiane was present, escorted by David. She had asked him: *Are women admitted?* David had answered, *Sunt famina magnates*. Free translation, *No common people*. Literal translation, *There are great ladies*. A duchess goes everywhere. Thus Lady Josiane saw the boxing-match.

Lady Josiane made only one concession, that of dressing herself in men's clothes, a thing then very much in vogue. Women travelled but little otherwise. Of the six passengers that filled the Windsor coach, it was rare that there were not one or two women dressed as men. It was the mark of the gentry.

Lord David, being in the company of a lady, could not appear in the match, and was fain to remain a mere spectator.

Lady Josiane betrayed her rank only in this, that she used a *lorgnette*, which was the habit of the gentlemen.

The "noble rencontre" was presided over by Lord Germaine, great-grandfather or great-uncle of that Lord Germaine who, about the end of the eighteenth century, was colonel, turned tail in a battle, was afterward minister of war, and escaped the canister-shot of the enemy only to fall under the epigrams of Sheridan, a worse grape-shot. Several gentlemen laid wagers—Harry Bellew, of Carleton, who had claims to the extinct peerage of Bella Aqua, against Henry, Lord Hyde, member of Parliament for the borough of Dunhivid, which was also called Launceston; the Honorable Peregrine Bertie, member for the borough of Truro, against Sir Thomas Colepeper, member for Maidstone; the Laird of Lamyrban, of the marches of Lothian, against Samuel Trefusis, of the borough of Penryn; Sir Bartholomew Gracedieu, of the borough of St. Ives, against the Right Honorable Charles Bodville, Lord Robartes, Keeper of the Rolls of the county of Cornwall. And others.

The two boxers were an Irishman of Tipperary, called by the name of his native mountain, Phelem-ghe-Madone, and a Scotchman called Helmsgail. This brought together two sentiments of national pride. Ireland and Scotland were going to fight; Erin was about to give the blow to Gajothel. So the bets exceeded forty thousand guineas, without counting the stakes.

The two champions were naked, with very short breeches buckled around their hips, and boots with nailed soles laced to the ankles.

Helmsgail, the Scotchman, was a little fellow, hardly nineteen, but he had already had his forehead sewed up; it was for this reason that the odds were two and a third in his favor. The month before he had smashed in the ribs and put out both eyes of the boxer Sixmileswater, which accounted for the enthusiasm. He had won for his backers twelve thousand pounds sterling. Besides his forehead sewed up, Helmsgail had a broken jaw. He was light and active. He was about the height of a small woman, thick set, well knit, of a stature low and menacing, and nothing had been wasted of the clay of which he was made; not a muscle but went to the mark—the pugilist.

There was compactness in his solid trunk—glossy and brown like brass. He smiled, and three teeth that he had lost gave point to his smile.

His antagonist was enormous; that is to say, weak.

He was a man of forty. He was six feet high, with the chest of a hippopotamus, and a pleasant expression. His blow would have split a ship's deck, but he did not know how to deliver it. The Irishman, Phelem-ghe-Madone, was all surface, and appeared to take part in boxing-matches rather to receive blows than to give them. Only he looked as if he might hold out a long time. A sort of under-done roast-beef, hard to bite, and impossible to digest. He was what they called in the local slang *raw flesh*. He squinted. He seemed resigned.

These two men had passed the preceding night side by side, in the same bed, sleeping together. They had drunk, from the same glass, each three fingers of port-wine.

Each of them had his group of backers, men of rough aspect, and threatening a need of umpires. In Helmsgail's group might be seen John Gromane, famous for having carried a steer on his back, and John Bray, who had borne on his shoulders ten bushels of flour, of fifteen gallons to the bushel, besides the miller, and had walked with this burden a distance of more than

two hundred yards. On the side of Phelem-ghe-Madone, Lord Hyde had brought from Launceston a certain Kilter, who lived at Greencastle, and threw over his shoulder a stone, weighing twenty pounds, higher than the highest turret of the château. These three men, Kilter, Bray, and Gromane, were of Cornwall, which was an honor to the county.

The other backers were roughs, strong-backed, bandy-legged, with large, knotty hands, of vacant countenances, in rags, and fearing nothing, being nearly all outlawed.

Many were admirably skilful in making the police drunk. Each profession should have its talents.

The spot chosen was beyond the Bear-Garden, where formerly there had been bear-fights, bull-fights, and dog-fights, on the other side of the last houses in course of building, adjoining the ruined priory of St. Mary Overy, dismantled by Henry VIII. The wind was north, and the weather frosty; a fine rain fell, rapidly congealing into sleet. The fathers of families who were present were recognized by their raising their umbrellas.

On the side of Phelem-ghe-Madone, Colonel Monterif, umpire, and Kilter, bottle-holder.

On the side of Helmsgail, the Honorable Pnghe Beaumaris, umpire, and Lord Desertum of Kilcarry, bottle-holder.

The two boxers were for some moments at rest in the enclosure, while the seconds compared watches. Then they walked up to each other, and shook hands.

Phelem-ghe-Madone said to Helmsgail, "I had much rather be going home."

Helmsgail replied, courteously, "The gentry should not disgrace themselves for nothing."

In their state of nakedness, they were cold. Phelem-ghe-Madone shivered. His jaws clattered.

Doctor Eleanor Sharp, nephew of the Archbishop of York, cried out, "Pitch in, my fine fellows! It will warm you up."

This little civility thawed them out.

They struck out at each other.

But neither the one nor the other was in anger. They counted three ineffectual rounds. The Reverend Doctor Grundraith, one of the Forty Fellows of All Souls, exclaimed, "Pour some gin into them!"

But the two referees and the two seconds—all four experts—decided that the rule must be maintained. Nevertheless, it was very cold. Then the cry was heard, *First blood!* The first blood had been drawn. The combatants were again brought face to face.

They looked at each other, approached each other, stretched out their arms, touched fists, then drew back. All at once, Helmsgail, the little man, gave a bound.

The fight began in earnest.

Phelem-ghe-Madone was hit in the forehead, directly between the eyebrows. His whole face ran down with blood. The crowd cried out, *Helmsgail has tapped his claret!* They applauded. Phelem-ghe-Madone, whirling his arms as a windmill its sails, began to throw his fists about at random.

The Honorable Peregrine Bertie said: Blinded. But he was not yet blind.

Then Helmsgail heard on all sides this cry of encouragement. *Bung his peepers!*

Indeed, the two champions had been well chosen, and, although the weather was not very favorable, it was pretty certain that the match would be a success. The quasi-giant Phelem-ghe-Madone had the drawbacks of his superiority; he moved heavily. His arms were clubs, but his body was a lump. The little fellow ran, struck out, leaped about, gnashed his teeth, doubled his strength by his alertness, was up to all the tricks of the ring. On one side there was the primitive fisticuff, savage, untaught, ignorant; on the other, the fisticuff of civilization. Helmsgail fought as much with his nerves as with his muscles, and with his cunning as with his strength. Phelem-ghe-Madone was a sort of inactive shoulder-hitter, some-

what punished at the beginning. It was art against nature. It was ferocity against barbarism.

It was clear that the barbarian would be beaten. But not immediately. Hence the interest.

A little one against a big one. The odds are in favor of the little one. A cat has the better of the dog. The Goliaths are always vanquished by the Davids.

A hail of outcries fell upon the combatants—*Bravo, Helmsgail! good! well done, Highlander!—Now, Phelem!*

Helmsgail's friends kindly repeated their bit of advice—*Bung his peepers!*

Helmsgail did better. Suddenly falling, and, rising again with the wriggle of a reptile, he struck Phelem-ghe-Madone on the sternum. The colossus staggered.

—Foul blow! cried Viscount Barnard.

Phelem-ghe-Madone sank down on Kilter's knee, saying—I begin to warm up.

Lord Desertum consulted the referees, and said:

—There will be five minutes' intermission.

Phelem-ghe-Madone fainted away. Kilter wiped, with a bit of flannel, the blood from his eyes and the sweat from his body, and put a bottle to his lips. It was the eleventh round. Phelem-ghe-Madone, besides the wound on his forehead, had his breast beaten in, his stomach swollen, and the crown of his head contused. Helmsgail had not a scratch.

A little noisy talk broke out among the gentlemen.

Lord Barnard repeated, Foul blow.

—No bet, said the Laird of Lamyrban.

—I claim my stakes, said Sir Thomas Colepeper.

And the honorable member for the borough of St. Ives, Sir Bartholomew Gracedieu, added:

—Let them give me my five hundred guineas; I will go.

—Stop the match, cried the spectators.

But Phelem-ghe-Madone raised himself up almost as staggeringly as a drunken man, and said:

—Let us go on with the match, on one condition. I shall have also the right of giving a foul blow.

On all sides they cried out:

—Agreed.

Helmsgail shrugged his shoulders.

The five minutes over, the round began.

The fight, which was an agony for Phelem-ghe-Madone, was a pastime for Helmsgail.

What a thing is science! The little one contrived to get the giant in chancery, that is to say, all of a sudden, Helmsgail caught under his left arm, which was bent like a pruning-hook, Phelem-ghe-Madone's big head and held it there under his arm-pit, the neck doubled up and the nape down, while, with his right fist, falling and falling again, like a hammer upon a nail, but on top and from below, he beat in the features at his ease. When Phelem-ghe-Madone, released at last, raised his head, he had no longer any features at all.

What had been a nose, eyes, and a mouth, had the appearance only of a black sponge soaked in blood. He spat out four teeth upon the ground.

Then he fell. Kilter received him on his knee.

Helmsgail was scarcely hurt at all. He had some trifling bruises and a scratch on the collar-bone.

Nobody was cold now. The odds were sixteen and a quarter upon Helmsgail against Phelem-ghe-Madone.

—Take your muffer, said Kilter to Phelem-ghe-Madone, and, cramming the bloody flannel rag into a bottle, he washed it with gin. Then he retouched his mouth, and Phelem-ghe-Madone opened one peeper. His temples seemed cracked.

—Another round, friend, said Kilter. And he added—For the honor of the lower classes.

The Welsh and Irish heard it. Nevertheless, Phelem-ghe-Madone gave no sign that indicated the least intelligence.

Phelem-ghe-Madone raised himself, Kilter helping him. It was the twenty-fifth round. After the manner of a Cyclop, for

he had but one eye. He got into position. It was understood that this was the closing round, and nobody doubted that he had lost. He raised his guard above his chin, folly of a dying man. Helmsgail, scarcely sweating, cried out,

—I back myself. A thousand to one!

Helmsgail, raising his arm, struck a blow, and, what was strange, both fell together. A grunt of satisfaction was heard. It was Phelem-ghe-Madone that gave it.

He had taken advantage of the terrible blow that Helmsgail had given him on the skull, to give him one, a foul blow, on the navel.

Helmsgail, at full length, rattled in the throat.

The spectators saw Helmsgail on the ground, and said,

—Paid off.

Everybody clapped his hands, even the losers.

Phelem-ghe-Madone had given foul blow for foul blow, and dealt after his right.

They carried Helmsgail off in a wheel-barrow. The opinion was that he would not recover. Lord Robartes cried out—I win twelve hundred guineas. Phelem-ghe-Madone had evidently been maimed for life.

Going away, Josiane took Lord David's arm, which is allowed to engaged people. She said to him:

—This was very fine, but—

—But what?

—I had supposed it would relieve my ennui. But it has not.

Lord David stopped, looked at Josiane, closed his mouth, and puffed out his cheeks in shaking his head, which signifies, attention! and said to the duchess:

—For ennui there is but one remedy.

—What?

—Gwynplaine.

The duchess asked:

—What is gwynplaine?

## THE ORGANIST'S STORY.

ONE afternoon last fall, as I was passing the Church of the Evangel on my way home from business, I met Moretown, the organist. Moretown is a stoutish man, with pink cheeks, and a pleasing expression of face, and looks like any thing in the world but a musician.

*Mem.*—How does it happen that so many eminent violinists, pianists, orchestra conductors, and divine tenors and sopranos, are such lumpy persons to the eye? One would naturally expect to see bare bundles of muscles and nerves, from which all the flesh had been worn off by the fret and tear of musical life.

Moretown was rolling through the gateway of the church, when he saw me and stopped; and, as I came up, languidly feached out his chubby white hand for me to shake.

"Glad to see ye, Jack," said he. "Come in and hear me play."

"Thank you, George," said I, returning his hearty grip, "nothing could give me greater pleasure," which was true, for I admired his playing, and often attended service at the Church of the Evangel to hear him and—well, yes—Dr. Jessamin's sermons, though, perhaps, I ought to be ashamed to say that sometimes the music was the chief attraction for degenerate me. "Alone, George," I asked, "or a choir rehearsal?"

"Alone, Jack, barring the blower, who is now waiting for me inside. I suppose you'll be the whole audience."

"This is delicious. I shall enjoy it greatly." So into the church we went.

We found the blower in the porch seated on the lowest step of the gallery-stairs, looking as if he had just waked up. He was so heavy of aspect, that I at once rated him as a person of great, but possibly neglected musical gifts. Nodding his head at us, he walked up-stairs, knocking his clumsy boots at every step.

"Blower some musical taste, George?" I whispered.

"Don't know one note from another. Spoils a blower to have an ear for music."

"You astonish me. Explain."

"Simple enough. A blower who knows music is apt to forget himself, and stop blowing to hear me. First thing I know, the bellows are empty and the tune dies out with a squeak. Been caught that way two or three times, but, since I got this fellow, feel safe. If the angel Gabriel should sit down to the keys and play the latest music from heaven, Tom would pump away all the same, in dead earnest, as if he were clearing a ship's hold."

I expressed my amazement in an "Ah!" By this time we had reached the organ-loft. I looked about me and marked the holy beauty of the church, which seemed more sacred and solemn in its emptiness and hush than when it was thronged with fashionable worshippers. The sun was yet an hour high, and his slanting beams struck great masses of rich colors from the upper windows and sifted them into the atmosphere of the edifice.

Tom, never saying a word, went to his place behind the organ, and began to get up wind. It sounded like a horse wheezing, and the effect was not bettered by an asthmatic accompaniment from Tom himself. Having been a street-paver previous to his engagement by Moretown, he had acquired the habit of his class of emitting a profound sigh at every stroke.

When George sat down to the instrument and began to play, his whole appearance changed. His face shone, his eyes flashed, his body swayed to and fro with pliant grace, his hands flew like lightning over the keys. I sat silent, and drank in the harmonies while he played for me, in succession, scraps of sonatas from Bach, anthems from Cherubini, dirges from Chopin, crashes from Wagner, flute plaints from Rossini. It was a wonderful medley, meant to try the resources of the organ, and the skill of the performer in suddenly shifting keys, styles, and expressions. As became a critical but grateful audience of one, I applauded with my thumbs at the end of every fragment. Finally, out of the sweet jargon, there stole the simple, heart-moving air of Schubert's "Wanderer"—the wail of the exile, the dirge of desolation. "My own variations," said George—as he began to weave it all over with the broidery of his fancy. At intervals, the mournful air would reappear on different stops and octaves, and at last George got it down to the deepest bass. As he moved among the profoundest notes, striking out deafening volumes of sound, I observed that, at times, the whole church trembled sympathetically. It seemed to catch a note, multiply it indefinitely, and fondly prolong it. When George stopped to rest, and I had heartily thanked him, said I—

"Please tell me what causes that deep thrill all through the church, when you touch some of those bass keys?"

"I strike the key-note of the church. See, now (blow away, Tom)." He commenced at C C and went down by semitones to C C C, the bottom of the bass. It was thunder of different degrees. I remarked a vibration in the choir, and parts of the building near us, at each successive note; but there was one to which the whole pile responded. I waited till he reascended the octave, and, when he touched the note again, said I, "That's it."

"F sharp. The key-note of the Church of the Evangel."

"Does every building have its key-note?"

"Undoubtedly. This church, for instance, is only a gigantic organ-pipe, pitched on F sharp, octaves and octaves below my lowest. When I touch that note on the deepest bass, a sound is produced loud enough for the church to catch and vibrate to sympathetically."

"A very curious and interesting fact," said I.

"What would you say if I told you every human being has his or her key-note?"

"I should not doubt it, but would like some proofs, if it is all the same to you."

George turned on the music-stool in a very animated manner. "I won't theorize on this singular proposition of mine, but will tell you a true story to illustrate it, if you have twenty minutes to spare."

"The subject interests me. So does your earnest air. I am a bachelor, and will give you all night."

"I also am a bachelor," said George, laughing; "but you shall learn from my narrative whether I am likely to remain one forever."

Here, then, is the story of my friend the organist, with my thick fire of questions and exclamations of astonishment omitted:

Before I came here to be organist and musical director—now four years past—I held that position in the leading church in a smart little town of Western New York.

I claim exclusive control of the church music, and resent meddling with it from rector or assistant, just as he would resent my dictating what sermons he should preach or what hymns read. This is not canon law, I know, but 'tis usage, and I stand up for it. Be good enough to bear this preface in mind—for it contains my justification.

About a year before I moved to the city, the soprano of this rural church died, and I had to find a new one. I knew of a fresh, delicious voice of good compass and power belonging to a young girl, Nelly Beck by name. She was the pupil of a music-teacher, a friend of mine, and strongly recommended to my interest, not only because she sang beautifully, but because her mother was a poor widow and had three other young children. My only objection to her was—she was very handsome. You smile at this. But pretty women sometimes play the mischief in choirs. They flirt with the tenor or bass, or both. I accept your amendment—and the organist. Snug place for flirting, behind these red curtains, I can tell you.

Well, notwithstanding Miss Beck's beauty, I engaged her. She disappointed me agreeably. She studied carefully, was very respectful and obedient to me, and did not flirt. To be frank with you, I began to take a real interest in her. You anticipate me. Yes, I may say, I fell in love with her. Here, said I to myself, is just the musical paragon and pretty woman for you, George Moretown.

I became quite attentive to Miss Beck. Saw her frequently from church—one of the charming prerogatives of the organist everywhere, and particularly in the country. Presented her with quantities of music. Made myself generally agreeable to her, and the tenor a trifle jealous. But she, while accepting my civilities, made no sign of reciprocating my feelings.

Thus things went on a few months—I having no real encouragement from Miss Beck, and hesitating whether to declare myself or not—when the rector secured a new assistant, the Rev. Mr. Hatcher. This gentleman had formerly been assistant in an interior county of the State, and, it was said, owed his new position to his distant relationship to the rector's wife. He had handsome features, fine curling hair, and side whiskers, and often wore a sweet smile which settled grim the next minute. A better reader I never heard. He intoned with the distinctness of a musical instrument. A faithful, industrious man in parochial duties, sincerely religious, I have no doubt. Ladies' society he was extravagantly fond of; and, being a bachelor, soon became a favorite. Perhaps, in such personal and business relations with clergymen as I sustain, I look too much under the cloth at the man. Anyhow, from the first, I did not much fancy Mr. Hatcher.

My main reason, I suppose, was, that he interfered with my music. He had a good ear and some taste, but he could not sing, or play on any thing. Yet he was presumptuous enough to advise me about tunes; and at rehearsals, at which my invited audiences were very limited and select, would drop in on us very much at home. I tried every plan, short of telling him so, to show him I regarded him as an intruder. But he took no hints, and smiled on me as if I had given him a hug instead of the cold shoulder.

Soon I had another cause of uneasiness—call it jealousy, if you will. Mr. Hatcher showed a plain liking for my pretty soprano. To be sure, his intentions were perfectly honorable. His idea seemed to be, so far as I could fathom him, not to find a wife, but to create as strong an interest for himself as possible in all the marriageable ladies of the church. Let me not blame him too much—for this Platonic love-making is almost the only exciting amusement permitted to young clergymen. But one can see that the pastime must be destructive, sometimes, to the peace of the female mind.

Miss Beck was greatly pleased with his courtesies. Many girls in her place wouldn't have resisted the temptation to flirt a little with the minister—the most enticing species of flirtation in the world, the ladies say. But she did nothing worth mentioning to encourage him. I thought it hard that Mr. Hatcher should try to get the better of me in Miss Beck's affections, when he had fifty or more handsome young women at his exclusive disposal down-stairs. It is only a confession of human nature to say, when I saw the assistant so sweet on her, that her value greatly rose in my eyes. I determined to try seriously

to win her love, and also to force Mr. Hatcher back into his proper place. How should I set about the tasks?

I decided to put to the practical test my theory of the *human key-note*.

I will not weary you with an account of the previous experiments (far from satisfactory), which led me up to the adoption of this strange theory, but will only state the general conclusion at which I had arrived. It was this:

*That every human being has a key-note, to which that being is responsive according to the development of its musical faculty; and that when a human being's key-note is struck, under the proper conditions, that being's real nature is for the moment laid open, the secrets of the heart come out on the face, and he or she is peculiarly susceptible to influences exerted by the person sounding the note.*

Do I make it tolerably clear? Thank you—that speaks well for your attention and discernment. Well, this odd theory I now had a powerful motive for applying to practice, and every opportunity to do so. Here were Miss Beck and the assistant minister at rehearsals; and here was my organ, on which I could strike notes experimentally while they stood near me, and watch the effect upon them. An organ is the only instrument, except the violin, on which my theory could be fairly tried; because it is the only one that gives a steady, prolonged note, capable not only of rousing but of keeping up the sympathetic condition of the person experimented on.

At the next rehearsal both of my subjects were present as usual. Miss Beck looked uncommonly lovely that evening. Large, arch black eyes, a beautifully-rounded forehead, and the peachiest of colors, forever flushing and vanishing from her cheeks—but I won't attempt to describe her, while you sit there grinning at me. Altogether a charming victim for my arts. The assistant minister came out in great force too. He was very lively and captivating, and seemed to me to have struck Miss Beck's key-note on some theory of his own. She was evidently quite interested in him. On me he beamed like a twin-brother. I studied him narrowly, and was confirmed in an old suspicion that his gayety was partly put on, and that beneath it could be found something not quite so childlike. That point I hoped would soon be tested by my theory.

Miss Beck was in charming voice that night. I noticed at times a little tremulousness, caused perhaps by her essaying some new and difficult music. I was glad of this, because I thought she would be more impressible. We executed several new chants and hymns, to the especial satisfaction of the assistant minister, who sat near by, and frequently gazed into the beautiful face of my soprano, beating time complacently with his head, and showering praises on all of us between the pieces. Presently we took a long pause, and Miss Beck came up and stood near me. She wished my opinion on that very difficult subject—the respective merits of three rival pianos. This opened a conversation, which I could easily protract for an indefinite time. As we talked, I pulled the flute stop, and began slowly to touch the keys corresponding to the register of her voice. At the same time I looked her fairly in the eyes, exercising whatever magnetic power I possessed. I tried to keep perfectly cool, though I know I must have been excited, for she visibly recoiled at moments from my ardent gaze. Why did I choose the flute-stop? Because that has a quality answering to the soprano voice. As I ascended the scale I pressed each tone and semitone long enough to try its full effect, doing this with seeming carelessness. With each successive note I would bend my soul—if I may use that expression—to the work of reading hers through her eyes. Her startled look speedily gave way to a dreamy reverie, as she let her eyes rest on mine, while a deeper blush crimsoned her cheeks, and her lips slightly parted. What note was I touching? D, and you may be sure I held on to it.

*I had struck her key-note.*

She was like one fascinated by an irresistible spell. I too was powerfully affected. The conversation, which we had conducted mechanically for some seconds, ceased; and there we were looking into each other's eyes, fixedly, and D was pealing through the air like an angelic summons.

"What a sharp sound, Mr. Moretown!" It was the voice of the assistant minister—a delicate hint that too much of one note was disagreeable. I turned on my stool, and saw that the contralto, tenor, bass, and Mr. Hatcher, were all looking at us. The note ceased, and the spell was broken.

In some confusion, I turned full to the keys and rattled off the first caprice that occurred to me. Miss Beck left my side, and took up her music-book for the next piece. So exultant was I in the thought that I had proved my original theory, that I might have gone on playing paeans for an hour, if a general fit of coughing among my hearers had not roused me to pursue the rehearsal.

We performed the last piece—a new motet. I remarked that the soprano faltered on the opening bars, as if under the influence of deep emotion. But she soon recovered herself, and sang as smoothly as ever.

The rehearsal over, we all prepared to take our departure. To me, as I have said, had commonly fallen the pleasant responsibility of taking Miss Beck home; and I had looked with some comfort to the walk that sweet summer evening. I had determined to follow up the good effect of my experiment on her.

Mr. Hatcher led the way, bidding us all good-night in the most cheerful manner. As he withdrew he directed a glance of admiration at Miss Beck; but, in the generosity of my heart, I forgave him—for had not I now secured, by an infallible method of my own, the exclusive good opinions of that young lady? Next went forth the bass and the contralto—they were getting up a match, it was whispered. And then—then—the tenor (who I supposed had entirely surrendered Miss Beck to me) tendered his services as an escort. She accepted them, and bade me an indifferent good-night, and off they paired. I was left alone—ah! no! Tom was there, and as he moved around turning out the lights, he looked at me quizzingly, as if he understood perfectly the fix I was in. I should have discharged him on the spot but for his rare gifts as blower.

I strolled out, rather savage, you may believe, and walked a couple of miles out of the way going home, to cool off.

I had proved my theory, perhaps, but had I not lost Miss Beck? There could be no mistaking the effect produced, while I sounded D—but might not every unnatural influence so exercised cause a reaction? Might she not, in pursuance of some profoundly unknown law of the case, contract an aversion for me, except when I could bring her under the dominion of the key-note? I wished I had never tested the theory, but had stuck to the old process of love-making, as handed down to us by our ancestors.

As for the tenor, if he did not mind what he was about, I would discharge him. His voice was reedy, and he had lately taken to absinthe. Really, it was about time he was dismissed.

But Mr. Hatcher, I could not help thinking, was the prime cause of the trouble. He had intruded on my jurisdiction. He had weakened my authority over the singers. He had started what seemed, to the secular eye, very like a flirtation with my soprano; and by the force of example had encouraged the tenor to set up as my rival in her affections. I resolved to take vigorous measures with Mr. Hatcher. And first, to obtain his key-note.

He was present at the next rehearsal. Miss Beck was in attendance as usual, and seemed by her actions desirous of making up lost ground with me. It is not in my nature to resist overtures from a pretty woman—you may smile Jack, but you know you are equally susceptible—and in a minute we were friends as good as ever. The tenor was forgiven, if not forgotten, and so would have been the Rev. Mr. Hatcher, if he had not made himself so exceedingly agreeable to the lady that evening. As I saw him smiling and uttering honeyed words in her ears (I could not hear them, but guessed they were honeyed, from the saccharine expression of his face), the determination to oust him by my new theory possessed me.

An opportunity soon offered for this. At the first pause in the singing, Mr. Hatcher stepped to my side and opened a conversation on the worn-out topic of playing secular music in church. I took what I may call the organists' side of the question—in favor of admitting such music under certain restrictions. Mr. Hatcher, as in duty bound, mildly opposed it. As we conversed, I secured my hold upon his eyes, establishing, after a moment's contest, my magnetic superiority; for his eyes wavered as I looked. At the same time I struck the open diapason, whose tones most nearly resembled those of Mr. Hatcher's voice. Slowly I climbed the scale, dwelling on each note, and more and more searching into the depths of his gray orbs. The look I was conscious of assuming was of one who knew his secret, and could read it through masks of stone. The flickering of his eyes ceased. They became riveted on mine. He turned pale, and beads of sweat started from his brow. I was pressing G sharp. *That was his key-note.*

"What—what is the matter? Are you sick, Mr. Hatcher?"

It was the compassionate voice of Miss Beck, who had seen, with some alarm, from the other side of the key-board, my startling experiment on the assistant minister. I lifted my finger, withdrew my gaze, and Mr. Hatcher shook his head, and started nervously away, like one roused from a horrid dream.

"I—I am not well. I have a bad headache," he murmured, and sat down and looked about confusedly. The tenor brought him a glass of water, and I opened a window to let in more of the fresh evening air. In a few moments Mr. Hatcher was better. Though gratified at the remarkable success of my test, I regretted that the subject had been made ill, and I kindly asked him what piece he would like to have us sing next. He thanked me, and said he would not wait longer, but go home. And this he did, looking so distressed, as he bade us good-night, that I really pitied him.

Our rehearsal over, it pleasantly fell to my part to escort the lovely soprano to her mother's house. Precisely how I gained the information it is not necessary to say; but I was satisfied, before we got to Mrs. Beck's—it took some time to make the journey—that the young lady's key-note had not been struck in vain.

I am almost ashamed to tell you what followed of my experiences with Mr. Hatcher. I plead the weakness of human curiosity, and the desire to have a firmer hold on the assistant minister, in case he continued to intrude on the choir, as my excuses. Having been convinced, by the revelations of the key-note, that Mr. Hatcher had an unpleasant secret in his bosom—and feeling confident, as the police say, there was a woman in the case—I set on foot a cautious inquiry into the gentleman's antecedents. A confidential friend of mine undertook the mission for me. I had heard that Mr. Hatcher had left his former parish, in a county not far away, quite suddenly and unexpectedly, and that the ladies had keenly regretted his departure. Of course; for he was a man, I assure you, of the most engaging manners, and of deep and genuine religious sensibilities. Please understand, again, that I do not deny him the possession of many high and rare qualities.

My friend visited Mr. Hatcher's former parish, and soon made a great discovery. He found, as he had expected, that the clergyman had achieved a remarkable success among the ladies. His fine looks, captivating ways, and emotional nature, had each contributed to make him quite the idol of the pews. Being a bachelor, a construction was put on Mr. Hatcher's attentions to the younger and fairer members of the church, not warranted, I am bound to say, by the facts. If he should be blamed for thoughtlessness in not checking his powers of fascination, those who suffered from them should also be censured for the carelessness with which they allowed themselves to become so deeply interested in him. You see I mean to do Mr. Hatcher justice. I feel that he peculiarly deserves it from me.

One of the young ladies of the parish who had contracted a strong passion for the minister, was named Emma Faye. She was a beautiful girl, an orphan, living with her aunt. Religion, poetry, sentiment, and delicate nerves, all quickened her admiration for him into an overpowering love. She sat in a pew near the chancel, where she could see every movement of her idol—her God almost—at his solemn priestly rites. Mr. Hatcher was quick to detect the emotions, differing from those merely of the devotee, which agitated this lovely creature. What man can blame him for feeling pleased with the exhibition? I, for one, cannot. Her looks were occasionally returned with more of meaning, perhaps, than the minister intended to throw into them. Miss Faye's aunt soon noticed these tokens of sympathy between her niece and Mr. Hatcher, and she aided in the mischief that followed, by inviting him frequently to her house. There, at many interviews, Miss Faye derived the impression, from his kind and sympathetic manner, and from his hastily-uttered words, too, I have no doubt, that her artless love was returned.

Mr. Hatcher soon found himself in an awkward position. His courtesies to Miss Faye had been remarked by everybody, and had caused evident jealousy in others of his admirers. Some hints from discreet matrons of the parish induced him suddenly to cease his visits to the young lady and the manifestation of any special interest in her. He did not reciprocate her attachment, and hoped, perhaps, it would die out. But she took the change in his manner badly to heart. She sickened under it, and was soon confined to her house. Then it fell to the minister to call and see her in her capacity of a sick member of the church—a duty he could not well avoid.

These official calls only made matters worse, adding to the poor girl's passion, increasing the unpleasant gossip of the parish, and making Mr. Hatcher more averse to Miss Faye than ever. At last his situation became very embarrassing. All the facts were known and much exaggerated, and parties formed *pro* and *con*. in the church. By some Mr. Hatcher was greatly censured; by others the whole subject was dismissed with the declaration that Miss Faye was a fool. To escape from the dilemma in which he was placed, the minister suddenly left his parish for the one where I first encountered him, and had never seen his old parishioners nor Emma Faye since.

Such were the facts gathered by my friend. He did not see the unfortunate girl, but he learned that her health was very poor; she was expected to die any day; the country people all said she was broken-hearted. Since Mr. Hatcher had withdrawn from the parish, public feeling had gathered against him, and he was almost universally denounced as thoughtless and careless—one or two said heartless—in his conduct toward the girl.

My friend and myself kept all these facts to ourselves; but I could not resist the temptation to let Mr. Hatcher know that I knew them. Now was my grand opportunity to discomfit him.

Mr. Hatcher had skipped two or three of the rehearsals, and, when we had met, our intercourse had been rather polite than friendly. Meanwhile I had made decided progress in the good graces of Miss Beck, and felt sure that if I proposed I should be accepted, and have her heart into the bargain.

One Saturday night the assistant made his appearance in the choir. To me he was supremely genial, and to the charming soprano more than customarily tender. My heart—I confess it with shame now—turned to steel against him. I no longer scrupled to bare to his gaze my possession of his secret. In an interval he sidled up to the organ, and started a conversation on the merits of Wagner's "*Tannhäuser*" (portions of which he had heard at concerts)—I standing up for the music of the future on general principles of progress, and Mr. Hatcher objecting to it as an unpleasant innovation.

My fingers glided to the keys, and, fixing my eyes vividly upon him, I struck G sharp of the open diapason. The expected effect followed. Increasing pallor, a disturbance of the eyes, a tremulous motion of the body, indicated his response to the key-note.

Suddenly, without withdrawing my gaze from him, I shut up the diapason and whipped out the vox humana and tremolo stops. On these I began to play a most mournful passage from one of Spohr's masses. Under my passionate hands the instrument fairly talked. The tremolo lent its tearful quality to the wail of the vox humana. It was like the cry of a woman—the effect at which I aimed. I never played better in my life, and my feelings were never wrought up to higher pitch. I knew I was trespassing on dangerous ground—the secrets of a human soul.

"Do you recognize it, Mr. Hatcher?" said I.

"No! I do not. Wh—what is it?" he faltered.

"*The dirge of Emma Faye!*" I whispered back, taking care that no one but Mr. Hatcher should hear me.

I would have given any thing the next minute to have recalled the words. The poor man put his hand to his brow, staggered, and would have fallen, had he not caught at a chair for support.

"She is dead, then!" he exclaimed; "Heaven pity me!"

All present heard the words, and started in amazement.

"Oh, no, sir! she is!"—I was about to add that she was not dead, and to beg his pardon for thus trifling with his feelings, when he put on his hat, and, with a hasty good-night, fled from the loft. I followed quickly, but, when I reached the open air, he had disappeared.

But the altar-window is darkening, and I will bring my story straight to a close.

And, first, about the unfortunate clergyman. Returning to the loft, I did not dare to tell the witnesses of the scene the causes that led to it; and we all agreed that Mr. Hatcher's mind had become suddenly affected, from parochial overwork, perhaps. Bringing the rehearsal quickly to a close, we went to the rector's house, where Mr. Hatcher lodged, and found he had arrived there, and was then in his room. In response to a message from me, he sent down word that he was not well, and had retired for the night. I could not feel easy till I had confessed my wrong; and so I wrote a note, to be handed to him in the morning, saying that Miss Faye was not dead and asking his pardon for having annoyed him; also assuring him that his secret was safe.

The next day, before the people were fairly astir through the town, Mr. Hatcher had left our parish forever. And now I tax you to guess the two endings of my story—one of which will surprise you, and the other will not.

"I'm not very good at puzzles," I replied—that is, I, the narrator of this story—"but one ending I hope is, that some day you will marry Miss Beck."

George laughed heartily. "Right," said he; "we've been engaged five years. Her mother was bedridden most of that time, and that's the reason we have not married. About four months ago Mrs. Beck died, and I hope to introduce you to Mrs. Moretown, say next June—and you shall hear her sing."

I gave him the grip of congratulation.

"And now for number two?"

"Give it up, George."

"Then prepare to be amazed. The Rev. Mr. Hatcher went from our parish back to his old one, and there he married Emma Faye."

"Good for him," said I.

"Yes, Jack, and good for me, too; for it relieved my mind, like a reprieve from death. The poor girl soon recovered her health, Mr. Hatcher moved West, and is now one of the most popular clergymen in his region."

"Among the ladies?" I asked, innocently.

"Yes, of course; but, since his marriage, that causes no trouble. 'Tis the unmarried parsons that do the mischief. So, you see, from these illustrations, that my key-note theory is not bad to apply in certain cases."

"But, seriously, George, do you believe in it? Perhaps the effects produced could be explained by animal magnetism."

George laughed. "To be serious, then, I think my magnetic power, or whatever we may call it, had something to do with the phenomena. I have made no experiments since. Having secured Nelly Beck, I have no wish to fascinate any other woman, and not the least desire to bewitch a man. Now that you are forewarned, it would be of no use to try on you.—And now what shall I play, my friend, to reward you for your patient listening?"

"Suppé's overture to 'Poet and Peasant,' one of my favorites," I answered.

"Fire away, Tom!" shouted George, to the blower.

Chugh! wheeze! chugh! and the organist dashed into the beautiful overture, and made such music as might not be disdained in Paradise.

When the last rich strains pulsed through the air, the deep purple of coming night filled all the building.

And then we rose and groped our way out of the Church of the Evangel into that other church, whose floor is the whole earth, and whose roof is the starry blue!

## THE WOMAN OF BUSINESS.

A NOVEL.

BY THE AUTHOR OF "THE BACHELOR OF THE ALBANY."

### CHAPTER VII.—THE DOCTOR'S STORY.

"AND you actually don't know who our patient is?" said Dr. Laurence.

They had dined, and were now smoking a cigar together, after Laurence had seen the old gentleman, and pronounced that he had turned the corner, thanks (as it was at least only courtesy to say) to Mr. Woodville's judicious treatment.

"And you don't know his history?"

"No, though his name was quite familiar to me."

"You never heard in Paris of Evelyn Pacha, or Evelyn Effendi?"

"Evelyn Effendi! you are surely joking."

"Not at all, I assure you; he was well known by that appellation ten or a dozen years ago."

"And how did he come by such an odd nickname?"

"In the most natural way in the world: he resided for years at Smyrna, where he was connected with a house in the Turkey trade, and, being a reading man, without any fixed opinions, he took to studying the Koran, and actually turned Mohammedan."

"You don't say so!"

"Whether he was ever actually a pacha, or was raised to any other Turkish dignity, I can't say, but he certainly deserted the Cross for the Crescent, and even wrote a book or a pamphlet giving his reasons for preferring the Prophet of Arabia to the Prophet of Nazareth."

"But he is surely not a Mohammedan at present; his interest in the Vaudois proves that."

"No, no, he is a good Christian enough now, I believe, and probably at this time of his life he will change no more—especially on his daughter's account."

"Was she a Mohammedan also?"

"No, though the name of Fatima smacks of the 'Arabian Nights,' but her father's connection with the Turkey trade explains that. She was brought up from a child by an aunt, and, to this day, hardly knows, I believe, to what extravagant lengths her father went when he was in the East, for his family and friends did every thing to hush the matter up, and it would probably have been forgotten before this, only for the unhappy consequences of his folly."

"It is easy to see that he is a weak, impulsive man, with more learning than judgment, but still I am amazed at what you tell me."

"Oh, he paid dearly for his freak; his apostasy cost him a son."

"How was that?"

"It is a singular story. You must know he has been twice married; Miss Evelyn is his child by his first wife. At Smyrna he married the second, an English girl, who had been brought up in the strictest evangelical principles, and, by her, he had the son I speak of. Now came the misfortune, indeed I might say the tragedy—remember this is all between ten and fifteen years ago. It was just about the time of the son's birth that the father embraced Islamism, and he made no secret of his intention to bring up the boy a Mohammedan too. It is said, but I never could bring myself to believe it, that the day was even fixed for performing the rite of circumcision; but certain it is that his poor wife fled from his house, carrying off the child, got on board a merchant-ship about to sail for England, and abandoned him. The ship was lost in a storm on the coast of Naples or Sicily, and the unfortunate Mrs. Evelyn, with the most of the people on board, perished."

"And the boy?"

"Was saved by a poor Italian, one of the passengers."

"But, at first, you spoke of the son having been lost."

"He was saved only to be lost again; at least, from that day to this, the father has never recovered him."

"How very strange! how did it happen?"

"The little I know I will tell you. There happened to be a young Englishman on board, who went by the name of Hardy; he was absconding from Smyrna, in consequence of some knavish transaction in which he was involved; and he was among the few saved. From him the British consul learned the child's parentage, and he wrote to inform Mr. Evelyn of its safety. Meanwhile, naturally enough, the consul allowed the infant to remain in the care of the man who had saved its life, as he happened to have a wife at Naples, and they seemed decent people. But it turned out most unfortunately, for, before an answer came from Mr. Evelyn, the Italian, his wife, and the child, disappeared, and, though they were traced as far as Turin, were never traced farther."

"How strange!"

"The only possible way to account for it was, that the Italian had learned from Hardy the cause of the mother's flight from Smyrna, and that either he, or his wife, under the influence of strong fanatical feelings, carried off the child to save its soul from its father and Mohammed."

"Is Mr. Evelyn a man of large property?"

"Pretty well, I believe; he has a nice estate, I think, in Devonshire or Cornwall. He was driven to distraction by the consequence of his folly."

"Tore his beard and his turban, and renounced the Prophet, I hope. But, of course, he took all the right steps to recover his child?"

"Ay, and wrong steps too. Among other things, he had the incredible simplicity to employ the scamp Hardy, at a salary of two hundred pounds a year, to prosecute the inquiry. The fellow induced him to believe that it was only a question of time, that if every nook and corner of Piedmont and the Italian cantons was effectually searched, the boy would certainly turn up—how likely that was to happen,

when two hundred a year depended upon its not happening—I leave you to judge.”

“And is he still paying the subsidy?”

“No, about a year ago he discontinued it. I suspect his daughter made him see his folly.”

“I can readily believe it,” said Woodville.

“Oh, she has all the sense her father wants; but they are not rid of Hardy yet. He has the audacity to pretend that the sums he has received have not covered half his expenses. He persecutes the poor old gentleman both in England and on the Continent, making the most extortionate demands on his purse, accompanied latterly by threats of publishing a full account of the business at Smyrna, with the details of which he is unfortunately too well acquainted. I am told the fellow was lately seen at Milan, very much out at elbow, and, I have no doubt, he is dogging Mr. Evelyn at this moment.”

“If he yields an inch to a rogue like that, he will be certain to take an ell,” said Woodville. “I trust he won’t find the poor gentleman out while he is in his present state of health.”

“If he should come here before you leave, I hope you will kick him down-stairs,” said Laurence.

“He would be much more likely to play that trick upon me,” said Woodville, laughing; “but, tell me, did you ever see our friend the Effendi’s pamphlet?”

“Never. I believe only a hundred copies were printed, and probably only half of these found their way to France or England. When his misfortune brought him to his senses, he spared no expense or pains to search for them and buy them up; he employed Hardy on that service also, and, no doubt, paid extravagantly for every copy he got possession of.”

“Another thing, Laurence. Miss Evelyn ought to be very unworldly to be excessively anxious to recover her lost brother, eh?”

“You mean that she had an eye to her own interest in breaking off the arrangement with Hardy? Well, I can’t speak positively of the moral side of Miss Evelyn’s character, but, in that case, she certainly only did what common-sense dictated, and I shall give her credit for right feeling also, until I see better reason for withholding it.”

Laurence went away the next morning; Woodville fixed his departure for the day following, and then put it off again, just for want of energy to pack his portmanteau. In this interval of dawdling, he resumed his sketch of Miss Evelyn, and was still balancing between the two expressions, when there was a rush of muslin in the corridor, followed by a hurried tapping at his door. When he went to it, he found it was the lady herself; but the cause of her emotion will be best explained after we have followed the steps of Mr. Alexander, and related his adventures.

#### CHAPTER VIII.—THE LAWYER’S FIRST CASE.

ALEXANDER would have advanced on his solitary journey more rapidly, had it not been his bounden duty to stop at all the places the Evelyns were in the habit of stopping, in order to recover the little green account-book. His first halting-place was Ivrea, where he arrived late in the day, but there was no book of that or any other kind in the poor inn where he put up, so he had no resource when he had dined, but to sit down and study the case which he had undertaken, with more courage (as he sometimes could not help thinking) than either modesty or discretion. A familiar device on an Etruscan vase is an imp with a pen in one hand and a flask of wine in the other; and the young lawyer, between his bundle of papers and his unfinished bottle of Barolo, presented a similar picture, especially in the dim light of a low and smoky *salle-d-manger*.

Being a solicitor’s son, he had perhaps an hereditary talent for dealing with masses of documents; at all events, he must have had the gift, from the methodical way in which he set about the first serious matter of business he ever had in his hands. Possibly, indeed, there was a degree of inspiration in it, for a man may be said to be inspired who devotes himself to an enterprise with all his heart and soul, with the fair form before his mind’s eye of one whose smiles he hopes to win. As he untied the papers, he observed that it was not red tape, as he thought at first, but an end of pink ribbon, they were bound with, and, no doubt, this little touch of feminine grace did not lessen the ardor with which he went to work.

He first arranged the papers according to their dates, then he read

them carefully over, making marginal notes of their contents as he went along, then he divided them into groups, saying to one group, “Irrelevancy—lie there!” to another, “Surplusage—lie there!” to a third, “Mere formality—lie there!” This winnowing process reduced the bulk to nearly a fourth, which fourth, having read over with the closest attention, he marshalled in the order he thought best for presenting the subject most intelligibly to another mind, perhaps not so quick as his own.

When all was done, he threw himself back on his chair, filled himself out a bumper, and laughed to think what a good hit Miss Evelyn had made when she said the case was chiefly darkened by the papers.

Then he tied them up again with the pink ribbon, handling it more delicately, you will easily believe, than if it had been the tape of his father’s office, finished his flask, called for a candle, and went to his bed, musing on diplomatic delays and legal prolixities, with other things, doubtless, on which at twenty-five it is still more natural to muse.

The next morning he was up with the lark and away to Chiavasso. “Eureka!” The little book with the odd name turned up at Chiavasso. This was success the first, and omen of successes to come. Alexander’s face beamed with delight when the landlord produced the missing treasure directly he was questioned about it.

Alexander then inquired when the post went out, as he must send the book by it.

The landlord having informed him, he took a large sheet of paper out of his writing-case, wrapped the book in it in the usual way, sealed and directed the packet, and, having done all this, left the *salle-d-manger*, for a few moments, to go to his bedroom. When he returned, he found a stranger sitting at the table where he left the packet, engaged in the gentlemanly occupation of examining it so closely as even to pry between the leaves of the little book as far as the cover permitted.

He was a man of the middle size, and so strikingly like his father’s partner in business, a gentleman named Moffat, that at the first glance Alexander actually thought he was the very man. His head was round, his hair sandy and close-cropped, no whiskers, nose short and lumpish, complexion to match the hair, and eyes small, twinkling, furtive, and unsettled—the sort of eye, that, without any thing bashful in it, never looks you straight in the face. He was travelling, and that no doubt explained the dust on his hat and clothes, but it did not so well account for their seedy condition, which the removal of the dust would only have made more evident. A man has a right to be negligent in his dress, but the stranger rather abused the privilege, so that, whether a gentleman or not, he was probably not at the present moment in flourishing financial circumstances. Alexander, however, formed his opinion of him neither from his shabby attire nor the expression of his countenance, but from the meanness in which he detected him, and still more from the hurried way in which he dropped the parcel when his examination of it was interrupted.

But the stranger’s embarrassment was only momentary, for he coolly observed, as Alexander approached the table—

“You write a fine bold hand, sir, a capital hand.”

“I hope you found it legible,” replied Alexander, with dry contempt.

“Perfectly; that’s the beauty of it,” said the seedy stranger, as coolly as before, just as if Alexander had seriously asked his opinion.

Receiving no answer to this last remark, complimentary as it was, the stranger, instead of being offended, grew more obliging, for Orta, he said, was the very place he was going to, and he would be happy to be the bearer of the parcel. It would be much safer, in his opinion, than sending it through the post.

“Thank you very much,” said our cautious young friend, without more courtesy than was absolutely necessary; “but I won’t trouble you.”

The shabby man was not in the least embarrassed by the curt rejection of his offer, for he proceeded to say, “I know the Evelyns very well.”

“Oh,” was Alexander’s laconic reply, and never was a monosyllable uttered in a tone better adapted to cut short a dialogue; but it had not the desired effect.

“I know more about Mr. Evelyn’s history than anybody living,” persisted his companion; “much more than he would like the world to know. Oh, if I wished to injure the old gentleman, I could do it;

but nobody has done him such good service as I have, though he has not behaved handsomely to me, or honorably either. Honor, sir, before every thing; don't you think so?"

While the stranger ran on in this way, Alexander, who had made up his mind that he was some discarded courier, or a butler discharged for drunkenness or dishonesty, had taken up an old newspaper, and affected to be so absorbed as not to hear the question addressed to him. He hoped this determined attitude would compel the fellow to hold his tongue; but, after a short interval, he made one more attempt to establish a conversation.

"Possibly, sir, you don't know Mr. Evelyn's story? If you like I'll tell it to you."

Alexander's patience was now exhausted.

"I do not like it," he said, in the most peremptory tone of voice he could assume. "I am reading, as you see, and I beg you will interrupt me no more."

"That's enough, sir," said the fellow, with the same unabashed coolness; "I'm not the man to talk to any gentleman who does not like to be talked to."

It was late in the day. Alexander posted the green book, and returned to the inn to dine. There was a *table d'hôte*, but he ordered his dinner apart, to guard against the chance of a renewal of the stranger's impertinence. The likeness to Moffat, his father's partner, struck him more every time he looked at him. But Moffat, he knew, had a brother, of whom he had not heard much, but the little he had heard of him was not to his advantage, and this tallied remarkably well with the conclusion he was forced to come to as to the stranger's character. At the same time he could with difficulty bring himself to believe that the brother of a man of the high position and respectability of the Moffat he knew could be either of so low a stamp or in such apparently needy circumstances; and this impression was much strengthened by what occurred before he left the place next morning. Alexander was taking an early breakfast, as the coach he was to travel by started early, when he observed an unusual commotion in the house, landlord and landlady, waiters and chambermaids running to and fro in excitement, with a variety of exclamations—those of the landlord particularly vehement and indignant. The cause of the hubbub was simply that the seedy gentleman had decamped at cock-crow without either going through the ceremony of paying his bill or availing himself of the usual way of leaving an inn, having preferred the window of his bedroom, which was not much above the ground.

"Has he left no luggage behind him?" inquired Alexander.

"Only a rascally old trunk," said the dejected landlord.

"Oh, if he has left a trunk, he will be sure to return."

"I doubt if all its contents would pay me," said the landlord; but the doubt became a certainty the next moment, when his agitated wife rushed in with the decisive information that she had broken open the box, and found nothing but some old newspapers, an old coat and trousers covered with dust—no doubt those he had worn the day before—with a couple of good round paving-stones, to add the weight that every respectable portmanteau out to have.

Alexander could only sympathize with the plundered innkeeper, as he honestly paid his own little bill, and went his way, mentally apologizing to Mr. Moffat for having for a moment identified his brother with the swindler.

The next day he was in Turin.

[TO BE CONTINUED.]

## PAUL POTTER, THE CATTLE-PAINTER.

THE desire to see one picture was the chief motive that induced us to deviate from our route in passing up the Rhine, and to devote a day to a quaint old town whose buildings indicated their occupants to be a conservative people, unanimously opposed to any kind of innovation upon ancient usages; a community who were content to remain under the same roofs that gave shelter to their phlegmatic forefathers some centuries ago; a calm, heavy, soporific, slow-going set. Every thing about them—the moat and its drawbridge, the narrow streets, their venerable trees, their very horses, not to speak of their vehicles, of which history furnishes no data as to what particular epoch their invention may be assigned—alike presented an ancient and old-world appearance. To quote a gifted American poet's lines:

"Quaint old town of toil and traffic, quaint old town of Art and Song,  
Memories haunt thy pointed gables, like the rocks that round them throng."

The picture was Potter's "Young Bull;" the town, Hague, whose old name Gravenhaage indicates its position as the boundary of the principality of the ancient Counts of Holland. The Hague, which has always been considered the most aristocratic and pleasant of Dutch towns, was the birthplace of an English king and a trio of worthies—Bilkenidijk the poet, Boerhaave the physician, and Huygens the mathematician. When Holland became a kingdom it was chosen as the residence of the court, and its many beauties and attractions were uncombined elsewhere, and "*les délices de la Haye*" were spoken of even at the court of Versailles.

Holland has produced no greater cattle-painter, nor has any country, than the subject of this sketch, who was born at Eukhuysen, in the year 1625. His life was a short one, but he employed his brief sojourn most earnestly in the study of Art through Nature. He won and will ever hold an undying name as its true exponent, while his works increase in value as time adds to their years, and true criticism advances our knowledge. Paul Potter's ancestors had held honorable positions in the city of his nativity, and were descended from the noble house of Egmont. Soon after his birth, his father, who was a painter, made Amsterdam his permanent residence, and here Paul was taught by his father all that he knew of the rudiments of art. He never had another master, nor did he need one, for his own genius did for him what no master alone could effect, and at fourteen his skill as an artist was universally acknowledged. A few years later he left his father's house and settled at the Hague, where his genius at once brought him into notice, and where his pictures were fully appreciated, finding a ready sale among the connoisseurs of his day. The objection made by the rich architect, Balkenende, when Potter asked his daughter in marriage, that he was "only an animal-painter," and ineligible for such an honor, was soon removed by the patronage so profitably enjoyed by the young painter, and at the age of twenty-five he married Adrienne Balkenende, a gay, pretty, and flighty young lady, who, most unwillingly, we feel called upon to say, led the artist an unquiet life. Potter's house was frequented by the principal men of the nation, but it was wanting, alas! in domestic felicity. His wife was fond of flirtations, which gave the young painter constant uneasiness. One day he detected her listening to one of her admirers, when, enraged beyond measure, he cast over them the net-work he carried on his arm, and which he had taken from his horse, who wore it to keep off the flies; then tying them together with it, he exposed them both to the laughter of the friends in his house. So disgraceful and ridiculous an affair soon became the talk of the town, and at length induced the painter to leave the scene of his studies and triumphs, and to settle in Amsterdam. This was in the year 1652. Two years later, in the month of January, ere he had completed his twenty-eighth winter, he died of consumption—brought on by frequent exposure to the damp atmosphere while sketching in the open air—leaving behind him the wife he fondly loved, in spite of her objectionable conduct; and a little daughter three years old.

In the story of Paul Potter's career, we find one among the many examples which might be adduced to prove that a long life is not essential to gain immortality. We do not pass too high a eulogium upon him by saying that, as a painter of what a farmer would call "stock," he stands without a superior, and with few equals. Next to the extraordinary faculty with which he was endowed, the great success of Potter may be attributed to his constant, close, and loving study of Nature. It has been truly said that "she was, indeed, his nurse in childhood, his mistress in youth, and his constant companion to the end of his days. He bestowed unremitting attention on every object and circumstance that might tend to give beauty or picturesque effect. The dawn of day frequently found him in the field. The dewy freshness of early morning, the dazzling brightness of the mid-day splendor, and the growing refulgence of the declining sun, together with the variable appearance of the atmosphere, resulting from mists, rain, and wind, are depicted with unequalled truth by his magic pencil."

Potter painted landscapes as well as animals. To the latter, however, he is entirely indebted for the exalted position assigned to him among the masters. His *forte* was cattle; in horses he was less successful, unequal to his contemporary and countryman, Wouvermans, so famous for his white chargers, and to two English painters and a gifted young French artist of our own day. We, of course, allude to Landseer, Herring, and Rosa Bonheur. Potter's coloring is clear and brilliant, with a lustrous glitter that is peculiar to himself. The best test of the genuineness of his pictures is the wonderful correctness

of his cattle, exhibiting a thorough knowledge of the anatomy of the animal races. Although he left comparatively few pictures behind him, about one hundred and fifty specimens have been assigned to him by connoisseurs who have made his works their study. The sizes of some, and the exquisitely-delicate finish of almost the whole, proclaim the industry with which he labored during his brief career—

"Twas not a life;  
"Twas but a piece of childhood thrown away."

The "quaint old town," with its memories of the middle ages, where Potter won renown, presents no object of greater interest to the tourist or amateur than its museum of Chinese and Japanese curiosities, and the gallery of paintings, containing two works of a world-wide reputation—"La Leçon d'Atomie du Professeur Tulp," by Rembrandt, and the *chef-d'œuvre* of Paul Potter, "Un Jeune Taureau," painted when he was but twenty-two years of age. "It is executed with such extraordinary firmness and precision in the drawing and handling, and with such a full *impasto* of color, that many of the details appear to be rather modelled than painted; for the very texture of the hair, horns, and other parts, is delineated with an inconceivable fidelity. The animals appear to live and breathe; they stand upon earth, and are surrounded by air. Such, in fact, is the magical illusion of this picture, that, it may be fairly concluded, the painter has approached as near perfection as the art will ever attain." Besides the bull, a cow, some sheep, and an old farmer, are introduced under the shade of an oak; in the background are seen cattle grazing in a meadow, and in the distance a village spire. The figures are the size of life—the painting being eight feet by twelve. We have no account of the sum received by the artist for this work, but we find that it was sold, in 1749, for less than *three hundred dollars*. The Dutch Government now values it at forty thousand dollars.

The same gallery contains two smaller Potters, both landscapes—one with a group of cows standing in a stream, the other with a flock of sheep, and several of the race that perished in the conflagration of Ho-ti's cottage. They are valuable and much-admired works.

In the Louvre are two of this master's pictures, and one in the queen's collection, at Buckingham Palace. It is called "Milking Time," or, "The Dog and her Puppies," and may be considered a pleasing example of Potter's compositions. Size of the picture, twenty-one by thirty inches, and it cost its present possessor six thousand dollars. We have no knowledge of any genuine painting by Potter in the United States, although we have seen several copies.

Few great artists have laid aside the pencil at so early an age as Paul Potter. Angelo had reached the years of threescore and ten, before he gave to the world his "Last Judgment." Titian's noble portrait of Pope Pius the Third was painted at the age of seventy-two, and his wonderful work, "The Martyrdom of Saint Lawrence," at eighty-one. Many of Rubens's grandest works were executed after he had seen half a century of summers and winters pass away. Very few painters have accomplished so much in so short a period of time, and rarer still do we find the works of any master increasing so rapidly and to such an extent in commercial value as Paul Potter's—after all, the truest test of the merits of works of art. His name is one that neither his country nor the world "will willingly let die," but will remember through the coming ages with those of Raphael, of Rubens, and of Rembrandt.

## BIRDS OF PARADISE.

**M**R. ALFRED RUSSELL WALLACE, an eminent English naturalist, spent eight years in the Malayan archipelago in the pursuit of his favorite subjects, and has given us a most entertaining and instructive book about it. From his chapter on those most beautiful objects in nature, the Birds of Paradise, we present the following:

When the earliest European voyagers reached the Moluccas in search of cloves and nutmegs, which were then rare and precious spices, they were presented with the dried skins of birds so strange and beautiful as to excite the admiration even of those wealth-seeking rovers. The Malay traders gave them the name of "Manuk dewata," or God's birds; and the Portuguese, finding that they had no feet or wings, and not being able to learn any thing authentic about them, called them "Passaros de Sol," or Birds of the Sun; while the learned

Dutchmen, who wrote in Latin, called them "*Avis paradiseus*," or Paradise Bird. John van Linschoten gives these names in 1598, and tells us that no one has seen these birds alive, for they live in the air, always turning toward the sun, and never lighting on the earth till they die; for they have neither feet nor wings, as, he adds, may be seen by birds carried to India, and sometimes to Holland, but, being very costly, they were then rarely seen in Europe. More than a hundred years later, Mr. William Funnell, who accompanied Dampier, and wrote an account of the voyage, saw specimens at Amboyna, and was told that they came to Banda to eat nutmegs, which intoxicated them and made them fall down senseless, when they were killed by ants. Down to 1760, when Linnæus named the largest species, *Paradisæa apoda* (the footless Paradise Bird), no perfect specimen had been seen in Europe, and absolutely nothing was known about them. And even now, a hundred years later, most books state that they migrate annually to Ternate, Banda, and Amboyna; whereas, the fact is, that they are as completely unknown in those islands in a wild state as they are in England.

The *Paradisæide* are a group of moderate-sized birds, allied in their structure and habits to crows and starlings; but they are characterized by extraordinary developments of plumage, which are unequalled in any other family of birds. In several species large tufts of delicate bright-colored feathers spring from each side of the body beneath the wings, forming trains, or fans, or shields; and the middle feathers of the tail are often elongated into wires, twisted into fantastic shapes, or adorned with the most brilliant metallic tints. In another set of species these accessory plumes spring from the head, the back, or the shoulders; while the intensity of color and of metallic lustre displayed by their plumage, is not to be equalled by any other birds, except, perhaps, the humming-birds, and is not surpassed even by these.

The true Paradise Birds are omnivorous, feeding on fruits and insects—of the former, preferring the small figs; of the latter, grasshoppers, locusts, and phasmas, as well as cockroaches and caterpillars. When I returned home, in 1862, I was so fortunate as to find two adult males of this species (the Lesser Bird of Paradise, the plumage of which is most commonly used in ladies' head-dresses) in Singapore; and, as they seemed healthy, and fed voraciously on rice, bananas, and cockroaches, I determined on giving the very high price asked for them—one hundred pounds—and to bring them to England by the overland route, under my own care. On my way home, I stayed a week at Bombay, to break the journey, and to lay in a fresh stock of bananas for my birds. I had great difficulty, however, in supplying them with insect food, for, in the Peninsular and Oriental steamers, cockroaches were scarce, and it was only by setting traps in the store-rooms, and by hunting an hour every night in the fore-castle, that I could secure a few dozen of these creatures, scarcely enough for a single meal. At Malta, where I stayed a fortnight, I got plenty of cockroaches from a bakehouse, and, when I left, took with me several biscuit-tins-full, as provision for the voyage home. We came through the Mediterranean in March, with a very cold wind; and the only place on board the mail-steamer where their large cage could be accommodated was exposed to a strong current of air down a hatchway which stood open day and night, yet the birds never seemed to feel the cold. During the night journey from Marseilles to Paris, it was a sharp frost; yet they arrived in London in perfect health, and lived in the Zoological Gardens for one and two years, often displaying their beautiful plumes to the admiration of the spectators. It is evident, therefore, that the Paradise Birds are very hardy, and require air and exercise rather than heat.

The Great Bird of Paradise is the largest species known, being generally seventeen or eighteen inches from the beak to the tip of the tail. The body, wings, and tail, are of a rich coffee-brown, which deepens on the breast to a blackish-violet or purple-brown. The whole top of the head and neck is of an exceedingly delicate straw-yellow, the feathers being short and close set, so as to resemble plush or velvet; the lower part of the throat, up to the eye, is clothed with scaly feathers of an emerald-green color, and with a rich metallic gloss, and velvety plumes of a still deeper green extend in a band across the forehead and chin as far as the eye, which is bright yellow. The beak is pale lead-blue; and the feet, which are rather large and very strong and well formed, are of a pale ashy-pink. The two middle feathers of the tail have no webs, except a very small one at the base and at the extreme tip, forming wire-like cirrhi, which spread out

in an elegant double curve, and vary from twenty-four to thirty-four inches long. From each side of the body, beneath the wings, springs a dense tuft of long and delicate plumes, sometimes two feet in length, of the most intense golden-orange color and very glossy, but changing toward the tips into a pale brown. This tuft of plumage can be elevated and spread out at pleasure, so as almost to conceal the body of the bird. These splendid ornaments are entirely confined to the male sex, while the female is really a very plain and ordinary-looking bird, of a uniform coffee-brown color, which never changes, neither does she possess the long tail wires, nor a single yellow or green feather about the head.

The Great Bird of Paradise is very active and vigorous, and seems to be in constant motion all day long. It is very abundant, small flocks of females and young males being constantly met with; and though the full-plumaged birds are less plentiful, their loud cries, which are heard daily, show that they also are very numerous. Their note is, "Wawk-wawk-wawk—Wök, wök-wök," and is so loud and shrill as to be heard a great distance, and to form the most prominent and characteristic animal sound in the Aru Islands. The mode of nidification is unknown; but the natives told me that the nest was formed of leaves placed on an ant's nest, or on some projecting limb of a very lofty tree, and they believe that it contains only one young bird. The egg is quite unknown, and the natives declared they had never seen it; and a very high reward offered for one by a Dutch official did not meet with success. They moult about January or February, and in May, when they are in full plumage, the males assemble early in the morning to exhibit themselves in a very singular manner.

This is what the people called the "sácaleli," or dancing-parties, in certain trees in the forest, which are not fruit-trees, as I at first imagined, but which have an immense head of spreading branches and large but scattered leaves, giving a clear space for the birds to play and exhibit their plumes. On one of these

Natives of Aru shooting the Great Bird of Paradise.

The "King" and the "Twelve-Wired" Birds of Paradise.

trees a dozen or twenty full-plumaged male birds assemble together, raise up their wings, stretch out their necks, and elevate their exquisite plumes, keeping them in a continual vibration. Between whiles they fly across from branch to branch in great excitement, so that the whole tree is filled with waving plumes in every variety of attitude and motion. The bird itself is nearly as large as a crow, and is of a rich coffee-brown color. The head and neck is of a pure straw yellow above, and rich metallic-green beneath. The long plummy tufts of golden-orange feathers spring from the sides beneath each wing, and when the bird is in repose are partly concealed by them. At the time of its excitement, however, the wings are raised vertically over the back, the head is bent down and stretched out, and the long plumes are raised up and expanded till they form two magnificent golden fans, striped with deep red at the base, and fading off into the pale-brown tint of the finely-divided and softly-waving points. The whole bird is then overshadowed by them, the crouching body, yellow head, and emerald-green throat forming but the foundation and setting to the golden glory which waves above. When seen in this attitude, the Bird of Paradise really deserves its name, and must be ranked as one of the most beautiful and most wonderful of living things. . . .

This habit enables the natives to obtain specimens with comparative ease. As soon as they find that the birds have fixed upon a tree on which to assemble, they build a little shelter of palm-leaves in a convenient place among the branches, and the hunter ensconces himself in it before daylight, armed with his bow and a number of arrows terminating in a round knob. A boy waits at the foot of the tree, and when the birds come at sunrise, and a sufficient number have assembled, and have begun to dance, the hunter shoots with his blunt arrow so strongly as to stun the bird, which drops down, and is secured and killed by the boy without its plumage being injured by a drop of blood. The rest take no notice, and fall one after

The Red Bird of Paradise.

another till some of them take the alarm.

The lovely little King Bird of Paradise is only about six and a half inches long, partly owing to the very short tail, which does not surpass the somewhat square wings. The head, throat, and entire upper surface, are of the richest glossy crimson-red, shading to orange-crimson on the forehead, where the feathers extend beyond the nostrils more than half-way down the

beak. The plumage is excessively brilliant, shining in certain lights with a metallic or glassy lustre. The breast and belly are pure silky white, between which color and the red of the throat there is a broad band of rich metallic-green, and there is a small spot of the same color close above each eye. From each side of the body beneath the wing, springs a tuft of broad delicate feathers about an inch and a half long, of an ashy color, but tipped with a broad band of emerald-green, bordered within by a narrow line of buff. These plumes are concealed beneath the wing, but when the bird pleases can be raised and spread out so as to form an elegant semi-

circular fan on each shoulder. But another ornament still more extraordinary, and if possible more beautiful, adorns this little bird. The two middle tail-feathers are modified into very slender wire-like shafts nearly six inches long, each of which bears at the extremity, on the inner side only, a web of an emerald-green color, which is coiled up into a perfect spiral disk, and produces a most singular and charming effect. The bill is orange-yellow, and the feet and legs of a fine cobalt-blue. (See upper figure on the plate.)

The bird is about twelve inches long, of which the compressed and curved beak occupies two inches. The color of the breast and upper surface appears at first sight nearly black, but a close examination shows that no part of it is devoid of color; and, by holding it in various lights, the most rich and glowing tints become visible. The head, covered with short velvety feathers, which advance on the chin much further than on the upper part of the beak, is of a purplish-bronze color; the whole of the back and shoulders is rich bronzy-green, while the closed wings and tail are of the most brilliant violet-purple, all the plumage having a delicate silky gloss. The whole lower part of the body is rich buffy-yellow, including the tuft of plumes which spring from the sides, and extend an inch and a half beyond the tail. About six of the innermost of these plumes on each side have the midrib elongated into slender black wires, which bend at right angles, and curve somewhat backward to a length of about ten inches, forming one of those extraordinary and fantastic ornaments with which this group of birds abounds. The bill is jet-black, and the feet bright-yellow. (See lower figure on the plate.)

The Red Bird of Paradise is thirteen to fourteen inches long. The side plumes are of a rich crimson, and only extend about three or four inches beyond the end of the tail; they are somewhat rigid, and the ends are curved downward and inward, and are tipped with white. The two middle tail-feathers, instead of being simply elongated and deprived of their webs, are transformed into stiff black ribbons, a quarter of an inch wide, but curved like a split quill, and resembling thin half-cylinders of horn or whalebone. When a dead bird is laid on its back, it is seen that these ribbons take a curve or set, which brings them round so as to meet in a double circle on the neck of the bird; but when they hang downward, during life, they assume a spiral twist, and form an exceedingly graceful double curve. They are about twenty-two inches long, and always attract attention as the most conspicuous and extraordinary feature of the species. The rich metallic-green color of the throat extends over the front half of the head to behind the eyes, and on the forehead forms a little double crest of scaly feathers, which adds much to the vivacity of the bird's aspect.

We now come to the remarkable little bird called the "Magnificent," first figured by Buffon. The head is covered with short brown velvety feathers, which advance on the back so as to cover the nostrils. From the nape springs a dense mass of feathers of a straw-yellow color, and about one and a half inches long, forming a mantle over the upper part of the back. Beneath this, and forming a band about one-third of an inch beyond it, is a second mantle of rich, glossy, reddish-brown feathers. The rest of the back is orange-brown, the tail-coverts and tail dark-bronzy, the wings light orange-buff. The whole under surface is covered with an abundance of

The Magnificent Bird of Paradise.

The Superb Bird of Paradise.

plumage springing from the margins of the breast, and of a very rich deep-green color, with changeable hues of purple. Down the middle of the breast is a broad band of scaly plumes of the same color, while the chin and throat are of a rich metallic bronze. From the middle of the tail spring two narrow feathers of a rich steel blue, and about ten inches long. These are webbed on the inner side only, and curve outward, so as to form a double circle.

From what we know of the habits of allied species, we may be sure that the greatly-developed plumage of this bird is erected and displayed in some remarkable manner. The mass of feathers on the under surface are probably expanded into a hemisphere, while the beautiful yellow mantle is no doubt elevated so as to give the bird a very different appearance from that which it presents in the dried and flattened skins of the natives, through which alone it is at present known.

The Superb Bird of Paradise is one of the rarest and most brilliant of the whole group, being only known from mutilated native skins. This bird is a little larger than the Magnificent. The ground color of the plumage is intense black, but with beautiful bronze reflections on the neck, and the whole head scaled with feathers of brilliant metallic green and blue. Over its breast it bears a shield formed of narrow and rather stiff feathers, much elongated toward the sides, of a pure bluish-green color, and with a satiny gloss. But a still more extraordinary ornament is that which springs from the back of the neck—a shield of a similar form to that on the breast, but much larger, and of a velvety black color, glossed with bronze and purple.

Mr. Wallace states that there are eighteen species which seem to deserve a place among Birds of Paradise, and of these eleven are known to inhabit the great island of New Guinea—eight of which are entirely confined to it. "Although I devoted so much time to a search after these wonderful birds, I only succeeded myself in obtaining five species, during a residence of many months." He met with great difficulties in the pursuit:

To understand these, it is necessary to consider that the Birds of Paradise are an article of commerce, and are the monopoly of the chiefs of the coast-villages, who obtain them at a low rate from the mountaineers, and sell them to the Bugis traders. A portion is also paid every year as tribute to the Sultan of Tidore. The natives are therefore very jealous of a stranger, especially a European, interfering in their trade, and above all of going into the interior to deal with the mountaineers themselves. They, of course, think he will raise the prices in the interior, and lessen the supply on the coast, greatly to their disadvantage; they also think their tribute will be raised, if a European takes back a quantity of the rare sorts; and they have besides a vague and very natural dread of some ulterior object in a white man's coming at so much trouble and expense to their country only to get Birds of Paradise, of which they know he can buy plenty (of the common yellow ones, which alone they value) at Ternate, Macassar, or Singapore.

It seems as if Nature had taken precautions that these her choicest treasures should not be made too common, and thus be undervalued. This northern coast of New Guinea is exposed to the full swell of the Pacific Ocean, and is rugged and harborless. The country is all rocky and mountainous, covered everywhere with dense forests, offering in its swamps and precipices and serrated ridges an almost impassable barrier to the unknown interior; and the people are dangerous savages, in the very lowest stage of barbarism. In such a country, and among such a people, are found these wonderful productions of Nature, the Birds of Paradise, whose exquisite beauty of form and color and strange developments of plumage are calculated to excite the wonder and admiration of the most civilized and the most intellectual of mankind, and to furnish inexhaustible materials for study to the naturalist, and for speculation to the philosopher.

Thus ended my search after these beautiful birds. Five voyages to different parts of the district they inhabit, each occupying in its preparation and execution the larger part of a year, produced me only five species out of the fourteen known to exist in the New Guinea district.

## MA BELLE.

### I.

WHERE met we last,  
Ma belle?

Where hours of dreamy revel passed,  
And mellowed lights their lustre cast  
On swanlike neck and Parian arm;  
But yours, O queen, the perfect charm  
All worshipped there, *ma belle*.

### II.

My inmost soul before you bowed,  
Ma belle;  
Your beauty wrapped me like a cloud  
Of odorous fire; O calm and proud!  
Through all your grand imperial grace,  
I caught a love-gleam on your face,  
My star of fate, *ma belle*.

### III.

Where meet we now,  
Ma belle?  
Where many a flower-crowned woodland bough  
Bends o'er to hearken vow for vow:  
Gone is your old imperious air,  
I only see a virgin fair  
And soft as dawn, *ma belle*.

### IV.

And next our happy loves shall meet,  
Ma belle,  
Where all my being at your feet  
Lies fused in passion's noontide sweet,  
And altar flames, and incense fume  
Rise richly round your bridal bloom—  
All mine, all mine, *ma belle*!

PAUL H. HAYNE.

## ON THE INVOLUNTARY MOVEMENTS OF ANIMALS.

BY PROFESSOR FOSTER, OF UNIVERSITY COLLEGE, LONDON.

### I.

#### MUSCULAR AND CILIARY ACTIONS.

YOU have, at least, a fair right to expect that I should commence this short series of lectures on the "Involuntary Movements of Animals" by putting before you the exact meaning which I attach to the word "involuntary."

Unfortunately, the phrase is a negative one; and any correct definition of "involuntary" must necessarily be preceded by a definition of "voluntary" or of "volition." And I must trust to your goodness to allow me to postpone any attempt at definitions, at least until the end. I do so the more boldly, because we habitually recognize, both in ourselves and in the animal creation, movements which we call voluntary, and movements which we call involuntary, and, in many cases, feel no difficulty whatever in distinguishing between the two. In many other cases we do feel a great difficulty; and my purpose is to pass in brief review the broad features of what are commonly spoken of as "involuntary movements," beginning with those about which there can be no doubt, and ending with those about which there may be, and indeed is, great dispute.

First of all, let us spend a few minutes in coming to an understanding upon the meaning of certain technical terms of which I shall frequently have occasion to make use.

Nearly all the movements, certainly all the obvious movements, of our bodies are brought about by means of muscles. Every bundle of

fleshy fibres which we call a muscle is subject, under certain circumstances, to a change which is essentially a process of shortening, a drawing of the two ends of the bundle nearer to each other. Through the attachment of the ends of the muscle to bony levers and supports, or through other arrangements, the diverse and complicated movements of the animal frame are produced by this simple muscular faculty of shortening or contraction.

Allow me to put before your eyes, in a simple manner, the essential facts of a muscular contraction, robbed of all unnecessary complications. I have here one of the muscles of a frog's leg removed from its natural connections. One end of the muscle is firmly fastened to the platform above; the other end, hanging down, is tied to a lever, which is weighted, in order to put the muscle on the stretch. Naturally, the muscle, when it contracts, being fixed above, will pull the lever up. I have lengthened the lever with a straw, in order to make the movement more evident, and, further, have brought its point to make a tracing on this revolving cylinder.

Still attached to the muscle above, is its proper nerve, which I have dissected out, and placed over the two ends of these two wires, which you see leading from the little platform.

Obviously, then, we have here nothing but the muscle and its nerve, the former connected with the lever, the latter with the wires.

Both muscle and nerve are still alive. Nevertheless, so long as we let nerve and muscle alone, neither makes any sign of life. The lever is perfectly motionless. In the absence of any disturbance, there never would be any movement. After a while the muscle would become stiff with that stiffness, that *rigor mortis*, which creeps over all dying muscles, and, finally, both muscle and nerve would dry up, or decompose away, without ever having manifested any power at all. And yet power, latent power, power to move, is present. If I create a disturbance—if, for instance, I dip these electric forceps in the little cups of mercury in which our wires end—you will see that, either as the forceps touch the mercury, or leave the mercury, or as they both touch and leave, the muscle shortens, contracts, and the lever moves up.

There are three things to notice here:

First, there is a change or disturbance in the wires, an unseen change, a simple electric change.

Secondly, there is a change in the nerve, infinitely more complex than the electric change in the wire, but also invisible.

Thirdly, there is a change in the muscle, and this manifests itself, and is rendered visible, by the shortening, or contraction.

The disturbance (or the result of the disturbance) in the muscle, then, we call a *contraction*.

The disturbance in the wire we call a *stimulus*.

The disturbance in the nerve, which acts as a carrier between the stimulus and the contraction, we propose to call by the old-fashioned name of *nervous impulse*.

I have here used an electrical disturbance as a stimulus—that being, in many ways, the most convenient kind of stimulus. But I might have used many other kinds. For instance, if I pinch with a pair of forceps the nerve, we have the same nervous impulse, the same manifestation in the way of contraction; this we call a *mechanical stimulus*. Or, if I drop a little salt on the nerve, a chemical disturbance is set up, a series of nervous impulses follows, and, after a while, spasmodic contractions are produced; this is an instance of a *chemical stimulus*.

Further, in all these cases I have brought the stimulus to bear on the muscle through a certain tract of nerve. But the intervention of at least any thing more than the mere microscopic termination of the nerve in the muscle is unnecessary. I might have applied the stimulus direct to the muscle. You see that when I touch the muscle itself with the forceps, I get a contraction, just as I did when I dipped the forceps in the mercury-cups.

By stimulus, then, I wish to be understood to mean some disturbing cause which, brought either directly or indirectly through the nerve to bear upon the muscle, produces or strives to produce a contraction, and so a movement.

We must suppose that in the natural living muscle at rest there is an equilibrium of its component molecules, an equilibrium set up by the forces of nutrition—the stimulus upsets this equilibrium. A muscle in a state of contraction is a muscle thrown off its balance. In the same way we must suppose that there is a molecular equilibrium in an inactive nerve, and that, this equilibrium being upset by a stimulus, a complex disturbance so generated travels along the nerve in the form of a nervous impulse.

At all events, in muscles situate as this is, we may with justice say that there can be no contraction without a stimulus. We may even go so far as to say that there can be no sufficient stimulus without a resulting contraction, unless some special hinderance be present, and the question between a voluntary and involuntary movement resolves itself into this—Can we trace the stimulus of the movement back to that which we call the will, or can we not?

And now let me call your attention to an involuntary movement, which at first sight seems to contradict a great deal of what I have just been saying. Upon this little plate of paraffine I have pinned a small piece of animal membrane. Looking at it cursorily, you would say that there is no movement whatever in it. Nevertheless, movements are incessantly going on there. I can readily make those movements visible to you. If I place on one end of the membrane this small piece of cork bearing a little standard of black paper, you will see, even from a distance, that the cork moves with a slow but steady imperious progress, without haste and without rest, until it reaches the far end of the membrane. I replace the cork at the near end; again it commences its mysterious journey. I will hand round several similar pieces of membrane, that you may each of you verify this observation for yourselves. So often as the cork is placed on the end of the strip of membrane near the cross-mark on the little plate, so often will it travel in the same slow, blind way toward the other end. It might be made to repeat its journey during the whole time of the lecture and for hours afterward.

The piece of tissue thus manifesting an "involuntary movement," is a portion of the mucous membrane or lining of the throat of a frog. The existence of the movement was recognized by physiologists long ago, and their curiosity was greatly aroused to know its cause. The great anatomist, John Hunter, longed in vain to solve the riddle. It was not indeed till some forty years ago that, partly through the labors of German inquirers, and in this country more particularly by the admirable investigation of Dr. Sharpey, we came to know that movements of the kind which you have witnessed are brought about by the action of certain minute organs called cilia—that they are results of ciliary action. It is to ciliary movements that I wish for a little while to direct your attention.

If we were to examine with the microscope the structure of any of the pieces of membrane now before us, we should find that the inner (or in their present position the upper) surface was made up of several layers of little round oval or cylindrical masses called by anatomists *cells*; tiny vital bricks we might almost call them, lining the conduit of the throat. They are, of course, microscopic objects, invisible or nearly so to the unassisted eye.

We should, moreover, find that the upper surface of each cell in the uppermost layer was studded with minute hairs projecting from the surface. Each hair, or cilium, as it is called, would measure about one-fourth of an inch in length, and we might most probably count from twelve to twenty or more cilia in each cell. If the examination were conducted with sufficient speed and care, we should at first see nothing of these hairs, of these cilia; all that would catch our eye would be a transparent border to each cell, and something like the appearance of a stream of water running swiftly in one direction over the surfaces of all the cells. But, as the part began to faint and to draw near to death, we should become aware that the transparent border was in reality a row of cilia placed side by side, and occupied in an incredibly swift motion, a motion so swift that when it was at its height the individual cilia could no more be seen than can the separate spokes of a swiftly-revolving wheel. Each cilium is in fact a tiny oar incessantly engaged in lashing with exquisite rapidity the fluid into which it projects. It is thus that the impression of a swiftly-running stream is produced. There is reason to believe that under ordinary circumstances each cilium lashes away at the rate of at least about twelve strokes a second. You will thus readily understand why the cilium itself should be then invisible. When the movement has become sufficiently slow, each cilium may be seen, at each stroke, to bend itself down very much as a fishing-rod is bent by a heavy fish; and then at slower rate to return to its original straightness. Sometimes an undulatory movement may be witnessed, like that of a snake in the water, and some authors have described a movement of rotation combined with that of flexure. Most probably the simple bending movement is the natural and common one; the cilium lashes or whips the fluid around it. Since the process of straightening is carried out more slowly than that of flexion, the total effect of the action of the

cilium will be to drive the fluid on in the same direction as that in which the bending takes place. There is, however, some reason to think that each cilium is not a cylindrical tapering rod, but a flattened blade, whose broad surface is presented to the water in the downward, and the narrow surface in the upward stroke—that the cilium, in fact, gets greater propulsive effect with the same labor by executing the manoeuvre known in boating language as “feathering the oar.”

It is by the agency of cilia that these pieces of cork have been and still are being wafted, whipped along these strips of mucous membrane, and I have now to invite your attention to the question, By what mechanism are these cilia kept thus at work?

I think I may fairly claim the movement as an involuntary one. You see the work carried on in a fragment of bare membrane stripped of all its surroundings, at a time when the brain, the nerve, the heart, nay, even the muscles of the animal to which it belonged, have been long quieted in death. The movement before us is independent of the great nervous centres. Nevertheless, it might fairly be imagined that there existed even in this simple membrane, beneath the layer of ciliated cells, some mechanism of great vital endurance, possibly of a nervous character, whose working was at once the cause and guide of the ciliary movement.

The proof that no such causative mechanism exists is easy of reach.

Each cilia-bearing cell, loosened from its companions and surroundings, continues, if preserved in an appropriate medium, to work its cilia and to lash the fluid in which it finds itself, with almost if not quite the same energy and regularity as when it was in its proper place. I need hardly say that the force which the loose cell thus spends on the surrounding fluid, instead of moving the fluid, moves the cell. Very often these tiny objects may be seen driven by the force of their own cilia, eddying round like a rudderless boat rowed by desperate oarsmen. It is clear that we must look in the cell itself for any mechanism to explain the movement. If, however, we examine in all possible ways, and with the highest powers of the microscope, any of the cells from the throat of the frog, we find in them no trace of any thing like special structure, such as could suggest the play of any particular mechanism. The cells, pyramidal somewhat in form, are composed of delicate protoplasm. Toward the centre of each cell there is an inner kernel, or nucleus, with a nucleolus; but both nucleus and nucleolus are structureless. In the protoplasm composing the substance of the cell may be seen a few granules of variable size and appearance; nothing more. And these granules are most probably quite inert, undigested food of the cell, in fact, awaiting transformation into purer protoplasm, or dead waste products about to be cast off. Toward the summit of the cell, in fact, close under the basis of the cilia, even these granules are absent; here the cell-substance, like the cilia themselves, is composed of nothing but transparent, somewhat highly refractive cells, to our present means of optical analysis, and perfectly homogeneous material. It is true that the veteran microscopist Ehrenberg saw and described two muscles, one on either side of each cilium, and imagined that these muscles alternately bent the cilium down and raised it up. A recent author, moreover, has described certain connections of the cilia with the nucleus of the cell. But, with all respect for the manifold and fruitful labors of the great German, he must be admitted to be one of those many sons of science “who see visions.” A more acute observer than Ehrenberg, Dr. Sharpey, forty years ago refused to accept Ehrenberg's descriptions, and I believe we may, with even greater safety now than was then possible, say, that in these ciliate cells there is no structural mechanism to account for the ciliary work.

We may even go so far as to say that the cilia are by no means to be regarded as mere passive things, pulled up or down by muscles or by any other agency. Each cilium bends or bows itself; and whatever apparatus is required to carry out the action is most probably stowed away in the transparent, homogeneous, hair-like process itself. No one, it is true, has ever, as far as I know, witnessed the independent action of an isolated cilium; but one could hardly expect so tender and delicate a structure to survive the shock which separation from its mother-cell must inevitably produce.

In the absence, then, of any structural data upon which we might form an opinion of the nature of this ciliary action, we must fall back upon the general characters of the movement. And this we may fairly say, that the process which gives rise to the rhythmic dash of these tiny oars is a complex, vital, and not a simple physical one.

In the first place, the movement grows faint as the tissues lose life, and, it may be, slowly yet surely ceases with the complete death of the ciliate cells. In the second place, like all other vital actions, its continuance is possible only within certain limits of temperature, and it goes on most satisfactorily within still narrower limits. Cold slackens it, warmth quickens it. The natural temperature of the animal body to which it belongs suits it best of all. Too severe a cold slackens it until it stops; too great a warmth rapidly exhausts it, by calling forth too rapid an action. Toward most chemical and physical agents it exhibits remarkable susceptibility. Were I to place one of these pieces of membrane from the frog's throat in distilled water, the delicate cells and cilia would become dropsical from imbibition, and the movements you are witnessing would suddenly cease. Were I to place it in a strong saline solution, the cells and cilia would shrivel up, and the movement would thus from a contrary cause be arrested. Placed as the pieces of membrane are now, in a very weak solution of common salt (half per cent.), so that they neither swell nor shrivel up, the movement will continue for hours. Acids stop ciliary movement, as also do alkalies, even when used with very great dilution. The cilia that have been stopped by a very weak acid may be set going again by a very weak alkali; and as, curiously enough, the production of an acid is part and parcel of the death of this, as indeed of all other movement-producing tissues, a membrane growing faint in action, by reason of the gathering acid which betokens coming death, may for a while be revived and strengthened in its ciliary work by judicious treatment with extremely dilute alkali.

Ciliary movement, again, may be stopped through suffocation. All the little cells of which I have been speaking are, like the whole body to which they belong, continually engaged in breathing. So long as they are alive and at work, so long do they take in oxygen and give out carbonic acid; and, if their supply of oxygen be cut off, they droop, and their labor stops. You will readily understand that each cell, and, *a fortiori*, each cilium, needs but an infinitesimal dose of oxygen. Were I to plunge one of these pieces of ciliated membrane into an atmosphere absolutely free from oxygen, the ciliary movement would continue for some time, because there is dissolved or entangled in the membrane sufficient oxygen to last the cell a long while. But the movement would at last cease—cease long before its natural termination; and the proof that the stoppage was caused by the lack of oxygen, would be furnished by the fact that, if a supply of fresh pure air were speedily given to it, the dormant, asphyxiated cilia would wake up to life again, and once more begin their rhythmic lash.

To poisons, properly so called, cilia show, for the most part, an unusual indifference; but there is one agent, chloroform, which affects them rapidly and energetically.

If I were to expose one of these pieces from the frog's throat to the vapor of chloroform, the little piece of cork, now moving so briskly, would in a few seconds stand perfectly still. The vapor would put the membrane with its ciliate cells to sleep; and, if it were not too strong, and its action not too prolonged, we might, by exposure to purer air, call back the cilia from their sleep.

Concerning the action of one important agent—namely, electricity—there is great difficulty in coming to a conclusion. Most observers have failed to detect any influence with currents, either continuous or interrupted; still, it has been recently asserted that effects may be produced, though only under certain circumstances.

With the exception of this last agent, all the facts to which I have just called your attention not only indicate the truly vital nature of these mysterious ciliary movements, but they also betray the close affinity of the process with ordinary muscular actions. Indeed, if one had had to speak, not of the beat of a microscopic hair, but of an isolated arm—of a blacksmith's arm, striking the anvil with ceaseless labor—nearly the same things might have been said. Stripped of essentials, the things which are good or bad for ciliary life are good or bad for muscular life. And, if I may carry you with me so far as to venture to speak of things being muscular which nevertheless have not even the shadow of the structure of muscle, I would describe a cilium as a long, slender muscle, or perhaps, rather, as made up by a special arrangement of muscular molecules, and ask you to think of it as bending itself down and straightening itself up by various internal movements of its muscular molecules, just as an Oriental prostrates and raises his body by certain internal movements of its muscular molecules.

If you grant me this assumption (though it perhaps deserves a better name than assumption), then, remembering the statement made at the beginning of the lecture—that muscles spring into action only in obedience to the call of stimuli—we have to put to ourselves the question, Where or what is the stimulus which causes the cilium to bend? We seek a stimulus, intermittent in its application, one which comes and goes with each stroke of the lash, or perhaps two stimuli, both intermittent, each alternate with the other, one to bend and one to raise (for, as I might have said before, the idea that the cilium straightens by an elastic recoil is more than doubtful).

On this point I may at once say that no such stimulus or stimuli can be found anywhere outside the cilium or the ciliate cell, no disturbance of surrounding circumstances which twelve times a second acts and ceases to act. Every attempt to carry back ciliary movement to any external intermittent stimulus has failed. If we must refer the matter to a stimulus, then all we can say is, that the stimulus, whatever it be, must come from within the cell or cilium itself, must be generated out of that tumult of the molecules of the tissue which we call its nutrition or its life. We may suppose that the cilium, though muscular in nature, has a higher or more complex life than ordinary muscle; that, for example, while an ordinary muscle might be compared to a gun which is self-loading, but always requires to be fired, a cilium must be likened to a gun which not only loads itself, but lets itself off of its own accord, at times fixed by its own constitution. Or, perhaps (and this most probably is the better way of looking at the matter), we may imagine that each act of contraction, each lashing movement, is but the token of an overflow of power, generated by the life of the cell—that each cilium finds vent in a stroke whenever the molecules which compose it have raised themselves to a given tension.

## FRENCH MORALS AND MANNERS.

By A ROVING AMERICAN.

No. II.

### THE FRENCH GIRL.

WHEN Prince Napoleon returned to Paris, after his visit to America during Mr. Lincoln's administration, some one asked him what he thought of American society. "American society!" responded Plon-Plon, shrugging his shoulders—"I did not see any; I only saw boys and girls at dancing-parties."

Prince Napoleon's caustic criticism embodies the French judgment of our system, in which the Boys and Girls of the Period figure much more largely than the maturer portion of the society, which is driven to cards and the refreshment-waiters, when it ventures to show in public.

The basis of this difference between the foreign constitution of society and our own is to be found in the difference of the domestic or family life in the two countries, and in the fact that, where the social life of the Frenchwoman commences, that of the American woman usually ends—viz., with her marriage. "They manage these things better in France," says Sterne in his "Sentimental Journey:" and his remark is as applicable now as when it was made. The family is to society what the sun is to the green-house; and the maturity of the fruits or flowers produced depends much upon the quantity of light and warmth which can be brought to bear upon the blossom and the bud. "The child is father to the man," and to the woman, too; and the reverence for parents fostered in the French household, and enforced even by the laws, which give an authority almost absolute over the children up to a certain age, and which custom continues during the whole lifetime, stamps itself upon their whole social system. Young America, it is to be feared, retains little of that respect or reverence; and, instead of looking up to the maturer man and matron, impatiently pushes them aside and usurps their places, regarding them as too slow to keep up the fast paces in which it rejoices, from fast horses, to very fast young men and women, copying the worst models of the worst sets who have gained notoriety abroad,

and are considered "bad style" in England and *mauvais ton* in France. The youth of France, male and female, are kept carefully in the background, and seldom seen in society, until marriage gives them a position and that independence they never aspire to while under the paternal roof.

Not only the public sentiment, but the laws of France, give an almost absolute control to parents over children, until they are of full age; and, even after the children attain their majority, parental consent to their marriage is considered essential.

The devotion of the French mother to her children is very great, and her household duties absorb much of her time; while nowhere can be seen greater displays of devoted affection and demonstrative fondness than in a well-ordered French household. Frequently, even after the marriage of the younger members, the united families continue to live together under the same roof; and the pleasing spectacle is often exhibited, of three generations sitting daily at the same board, and dwelling together under the patriarchal control of the aged grandparents. The separation of families, almost universal with us, where the new scions are usually transplanted to the West, and the parents are left solitary in old age, while their offspring are peopling new regions far from the old homestead, is not so common in France, and the tendency is to cluster together, not to scatter. Thus the parental influence is felt and exerted throughout life, the experience and wisdom of age ever tempering the headlong ardor of youth and the maturer plans of manhood; for the foundation of all society is in the family, and, the stronger that tie, the healthier and the happier will be the society built upon it. In all societies, woman gives it the tone, whether as mother, wife, or head of a household; and the training she receives determines the measure of her influence, and the good or evil effects it produces. The training of the French girl is exceptionally good for this purpose, and her purity of mind and freshness of feeling preserved by the system, which is sneered at by those who do not comprehend it. The parental supervision of the boys is very strict; but that over the girls is stricter still, and they are treated as children, up to the period of assuming the obligations of the heads of households themselves, and guarded as carefully from all contact with the other sex as, under a different system, in the East. The mind and heart of a young French girl, tenderly nurtured, are like a virgin page of paper on which no impressions have yet been made—innocent of evil thoughts or deeds, and unhackneyed by premature experiences. The will of the parents has ever been the child's law; and that pernicious make-believe love-making, styled "flirtation"—in which young America indulges freely on entering her teens—the French girl would shrink from as immodest and shameless.

The French girl is taken early into society, but always under her mother's wing and strict supervision; and her shrinking modesty and timidity of manner surprise the American or Englishman, accustomed to the frank fearlessness of his fair young compatriots, who agree with the poet Burns that

"A man's a man for a' that,"

and by no means an alarming creature. "The Girl of the Period," as dissected in the *Saturday Review*, and *Echoes from the Clubs*—who doubtless exists on that side of the Channel, and whose imitators, with the aid of strong glasses, we can detect on the Fifth Avenue and on Broadway even here—is unknown in France, who may export her native follies, but never imports even one from abroad, not being an imitative country in such matters. Hence France still adheres to her good old ways, which preserve the rosebud fresh and untouched, until it has developed into the full-blown rose, instead of prematurely forcing and fading it before its petals have expanded, in a hot-house atmosphere of society.

Until marriage, mademoiselle is as shy as a partridge, and never ventures long from the protecting wing of her *chaperon*,

from whom her partner takes her for the dance, and to whom he promptly returns her when the quadrille is over; for unmarried girls do not often waltz. Her conversation is carried on with blushing cheeks and downcast eyes; and no promenading the rooms after the dance—when whispered nothings are exchanged or soft glances shot at you by the fair Parthian hanging on your arm—is permitted by French etiquette. The young girl would “compromise” herself, who tried these.

As for riding or walking alone with a man, married or unmarried, unless a very old one, the French girl would just as soon dream of letting him kiss her; and, in fact, would consider the one as improper as the other. And, oh, my fair young countrywomen! who, in your fearless freedom, under our widely-different system, open your eyes in wonder at the “pruderies” of your French sisters, and enjoy the privileges which they deny themselves in this regard—reflect a little on the matter, and you will find that their plan is the wiser of the two, giving a woman a longer reign and a stronger influence, both in society and by the home-hearth, the two spheres in which she shines the most.

## SKETCHES OF EARLY LIFE IN BOSTON.

### No. V.

#### HOW THEY MANAGED POLITICAL AFFAIRS IN BOSTON.

THE charter, under which the Massachusetts Bay Company existed, gave them authority to elect freemen, a governor, deputy-governor, assistants, and other officers, to hold and defend the soil of which they were possessed, against assailants, and to enact such statutes for the internal regulation of the colony as might not be repugnant to the laws of England. Their allegiance to the crown, and their amenability to the authority of the English Government, remained intact: *legally*, they had no more power to establish an independent communion and demand conformity to its doctrines and usages, than they would have had if they had never left the shores of Britain. There seems, however, to have been a sort of tacit understanding that, living as they did in such a remote region of the earth, they would be allowed to do very much as they pleased; at any rate, it was in their favor that it would require a long arm for the government at home to reach them.

During the first four years after the settlement of Boston, there was no *representative* assembly, but all the freemen of the colony came together for the election of the governor and other officers, and the discharge of the general duties of legislation. As soon as the population had become numerous, this *pure* democracy, of course, ceased to be practicable, and the principle of representation was adopted. At first, all male adults were recognized as freemen, and as endowed with equal rights; but, inasmuch as there were persons of various opinions and different forms of religious belief, scattered about in the several towns, as well as in Boston itself, it was thought expedient, after the lapse of a year, to confine the privileges of citizenship to those only who were *members of the churches*; and, thenceforth, no one was allowed to vote or hold office unless he were a communicant “in good and regular standing.”

Mr. Cotton, in his “Bloody Tenet, washed white in the Blood of the Lamb,” which was an elaborate vindication of the right and duty of religious persecution, alludes to this restriction in these mild terms: “The magistrates and other members of the General Court, upon intelligence of some episcopal and malignant practices against the country, made an order of court to take trial of the fidelity of the people, *not by imposing upon them, but by offering to them*, an oath of fidelity, that, in case any should refuse to take it, they might not betrust them with place of public charge and command.”

We shall not be surprised, after this, if we find the General Court to be a little exclusive in the administration of affairs.

This body combined in itself all the prerogatives which are

now distributed among various branches of civil and ecclesiastical government: it made the laws and interpreted them; and it arraigned criminals, tried, and sentenced them.

The *range* of its functions was marvellous. It decided questions of church polity, determined the validity of sacraments, and settled points of theological casuistry; it regulated the details of domestic economy, told men what they should eat, and how much they might drink; it was the arbiter of fashion, as well as the conservator of morals, prescribed the width of sleeves, the size of wigs, the degree of fineness in lace, and the length of hair which one should allow to grow upon his head; it watched over the private as well as the public talk of men and women, and took most vigorous measures to restrain the garrulity of the latter; it forbade the concoction of healing drinks and the spreading of plasters by female hands, as well as unlicensed freedom of speech; it called to its bar those who lived idly, as well as those who lived viciously; it prohibited travel beyond the precincts of the colony, without special leave; and it did some other things which we are not content to pass over in this summary way, because they have certain peculiar features, so characteristic of the times as to demand special attention.

Perhaps the most unique performance which they ever took in hand was the summoning before them of a body of Indians, to be catechized as to their willingness to keep the ten commandments. The replies of these old heathen to the various questions propounded sometimes evince not a little shrewdness mingled with simplicity. When inquired of as to the worship of God, they answered: “We desire to reverence the God of the English, because we see He doth better to the English than other gods do to others.” When asked if they would abstain from profane swearing, they said, naively: “We do not know what swearing is.” A promise being exacted of them not to do any work on the Sabbath-day, they replied: “That is easy for us, who have not much to do on any day, and we will take this care on that day.”

The *hardest* act of legislation ever perpetrated by this court was the passage of an act, providing that any man might bring a rebellious son before the magistrate, and, upon the statement of his continued obduracy, provided the boy had attained a certain age, demand that he should be put to death. There is, however, nothing to show that this law was ever carried into execution; it was probably enacted mainly with a view to its *moral effect* upon unruly boys, in restraining them from ill-behavior.

In 1632 we find the following somewhat startling entry in the records of the court: “Ordered, that Philip Swadden shall be whipped for running away from his master, *intending to go to Virginia*.” If Philip Swadden was an African, Virginia would seem to have been a singular place of refuge; but he was probably a white apprentice who had sold himself into service for a limited term of years, as was often done in those days, in order to pay for his passage to America. Two years after this Richard Coker was whipped for enticing servants to run away; and, in 1635, the following stringent “fugitive slave bill” was passed: “It is ordered that, whensoever any servants shall run from their masters, it shall be lawful for the next magistrate to press men, or boats, or pinnaces, at the public charge, to pursue such persons by sea or by land, and bring them back by force of arms.”

We find, moreover, that any person, white or black, was liable to be reduced to slavery, for at least a limited period, if guilty of what the court might please to consider “ill and insolent carriage;” and, in order to secure the prompt payment of taxes, it is ordered “that the bodies of delinquents may be sold for fines or rates remaining unpaid.”

In 1641 it was further “ordered, that if any servants escaped to the Indians, and were not sent back, as many Indians should be seized and *captivated* in their place.”

It was not until the year 1645 that any negroes were brought from Africa to be sold in the market as slaves. In the following year the court enacted that "it was bound, by the first opportunity, to bear witness against the heinous and crying sin of man-stealing, as also to prescribe such timely redress for what was past, and such a law for the future, as might sufficiently deter all others belonging to the colony to have to do in such vile and most odious courses." There is no further mention of this subject in the statutes until 1703, when a law was passed to prevent owners of slaves from setting them at liberty without becoming responsible to the country for all charge about them, and prohibiting them from being abroad after nine o'clock in the evening.

It is edifying to find, in the early records of the court, a disposition manifested to encourage anatomical science, as is evinced by a law giving students of medicine liberty "to anatomize once in four years some malefactor, in case there be such as the court shall allow of." In the instance of a malefactor's not turning up as often as once in four years, the cause of science must have been likely to suffer; and, with medical men, a peculiar interest was probably felt in the statistics of crime.

It is an abrupt and painful transition to pass from this to the subject of matrimony; but, in the same connection, we find it stated that, a great marriage being held in Boston, Mr. Hubbard was procured to preach on the occasion, which led to the passage of a law prohibiting any thing of the sort in future, lest "it should bring in the English custom of *ministers* performing the solemnity of marriage, which sermons at such times might induce."

We are further informed that Governor Bellingham, at his second marriage, dispensed with the interference of any other official, and married himself.

In 1643 paper had become so costly a luxury as to lead to the order that, in elections hereafter, "the freemen shall use Indian-beans instead of paper; the white beans to manifest election, the black for blanks;" with a fine of ten shillings for putting in more than one bean at a time.

In a very literal sense, politicians might thus be said to feel the *pulse* of their constituents.

One more specimen of the legislation of the times, and we have done: "Ordered, that a fine of eleven shillings and six pence shall be imposed upon any person who interrupts another when speaking in public."

If the settlers of Boston had been wise enough to bring over a lawyer or two with them, it might, upon the whole, have been a blessing to the community. A little legal skill would have given to the legislation of this period a very different aspect; the proper distinction between that which falls within the province of civil law and those matters that pertain to one's private conscience might then have been observed, and a more equitable justice distributed through society. But it was not until 1638 that any member of this profession found his way there, and four years' experience in Boston was enough for him, when he returned home to England. It did not accord with the policy of the magistrates and the elders of the churches that there should be any third party to interpose between them and criminals, or to give advice in regard either to the validity of their laws or the modes in which they were to be carried into effect.

The assaults upon lawyers from the pulpit were made in the loftiest style of ecclesiastical vituperation. The abhorrence of this profession was not confined to Puritans on this side of the Atlantic—good Mr. John Rogers, the distinguished martyr, with a large family, speaks in a sermon of "the incredible wicked-

ness of that profession, their guiltiness of all manner of sins which the nation lies under—as blood, theft, oppression, injustice, contentions, hatred, cozenage, and fraud; rebellion, lying, perjury, and *what not*."—See Discourse, entitled "Heavenly Nymph!"

It was very much in the same style that preachers, in and about the town of Boston, handled the lawyers; so that, for more than a century, it was hardly considered as an employment in which any respectable person could be expected to engage. If Mr. Webster or Mr. Choate had lived in those days they would never have been appointed to deliver public eulogies, or make "forefather-orations."

There are some important lessons taught by the legislation which we have now reviewed, that may be timely. The experiment was fairly tried, under the most favorable auspices, to regulate public and private morals *by law*, and also to secure uniformity of belief and opinion, through the same process. What was the result? Of *certain styles* of crime which prevailed in those days, common decency forbids us to speak. As it respects the ordinary forms of vice, a careful examination of the records forces upon us the conclusion that, in proportion to the population, the amount of crime was much greater then than it is in Massachusetts to-day.

The experiment was an utter failure. There were, indeed, many very saintly men in the community; but, on the other hand, there were many *worse* men than we ever hear of in modern days. There was very little gayety; but there were forms of sin practised which the tongue would be defiled by uttering.

The attempt to enforce uniformity of belief by law resulted, as might have been expected, in aggravating the evil which it sought to cure. The list of damnable heresies, from time to time set forth, was truly formidable. "That which hath been, it is that which shall be; and there is no new thing under the sun."

## WHAT THEY THOUGHT IN THE AUGUSTAN AGE.

By W. E. H. LECKY.

IT is extremely difficult for an ordinary man, who is little conversant with the writings of the past, and who unconsciously transfers to other ages the critical spirit of his own, to realize the fact that histories of the most grotesquely extravagant nature could, during the space of many centuries, be continually propounded without either provoking the smallest question or possessing the smallest truth.

We may, however, understand something of this credulity when we remember the diversion of the ancient mind from physical science to speculative philosophy; the want of the many checks upon error which printing affords; the complete absence of that habit of cautious, experimental research which Bacon and his contemporaries infused into modern philosophy; and, in Christian times, the theological notion that the spirit of belief is a virtue, and the spirit of skepticism a sin. We must remember, too, that, before men had found the key to the motions of the heavenly bodies—before the false theory of the vortices, or the true theory of gravitation, when the multitude of apparently capricious phenomena was very great—the notion that the world was governed by distinct and isolated influences was that which appeared most probable even to the most rational intellect. In such a condition of knowledge—which was that of the most enlightened days of the Roman empire—the hypothesis of universal law was justly regarded as a rash and premature generalization. Every inquirer was confronted with innumerable phenomena that were deemed plainly miraculous.

When Lucretius sought to banish the supernatural from the universe, he was compelled to employ much ingenuity in endeavoring to explain, by a natural law, why a miraculous fountain near the temple of Jupiter Ammon was hot by night and cold by day, and why the temperature of wells was higher in winter than in summer. Eclipses were supposed by the populace to foreshadow calamity; but the Roman soldiers believed that by beating drums and cymbals they could cause the moon's

disk to regain its brightness. In obedience to dreams, the great Emperor Augustus went begging money through the streets of Rome, and the historian who records the act himself wrote to Pliny, entreating the postponement of a trial. The stroke of the lightning was an augury, and its menace was directed especially against the great, who cowered in abject terror during a thunder-storm. Augustus used to guard himself against thunder by wearing the skin of a sea-calf. Tiberius, who professed to be a complete freethinker, had greater faith in laurel-leaves. Caligula was accustomed, during a thunder-storm, to creep beneath his bed. During the games in honor of Julius Cæsar, a comet appearing for seven days in the sky, the people believed it to be the soul of the dead, and a temple was erected in its honor. Sometimes we find this credulity broken by curious inconsistencies of belief, or semi-rationalistic explanations. Livy, who relates with perfect faith innumerable prodigies, has observed, nevertheless, that the more prodigies are believed, the more they are announced. Those who admitted most fully the reality of the oracles occasionally represented them as natural, contending that a prophetic faculty was innate in all men, though dormant in most; that it might be quickened into action by sleep, by a pure and ascetic life, or in the prostration that precedes death, or in the delirium produced by certain vapors; and they added, that the gradual enfeebling of the last was the cause of the cessation of the oracles. Earthquakes were believed to result from supernatural interpositions, and to call for expiatory sacrifices, but at the same time they had direct natural antecedents. The Greeks believed that they were caused by subterranean waters, and they accordingly sacrificed to Poseidon. The Romans were uncertain as to their physical antecedents, and therefore inscribed no name on the altar of expiation. Pythagoras is said to have attributed them to the strugglings of the dead. Pliny, after a long discussion, decided that they were produced by air forcing itself through fissures of the earth, but he immediately proceeds to assert that they are invariably the precursors of calamity. The same writer, having recounted the triumphs of astronomers in predicting and explaining eclipses, bursts into an eloquent apostrophe to those great men who had thus reclaimed man from the dominion of superstition, and in high and enthusiastic terms urges them to pursue still further their labor in breaking the thralldom of ignorance. A few chapters later he professes his unhesitating belief in the ominous character of comets. The notions, too, of magic and astrology, were detached from all theological belief, and might be found among many who were absolute atheists.

These few examples will be sufficient to show how fully the Roman soil was prepared for the reception of miraculous histories, even after the writings of Cicero and Seneca, in the brilliant days of Augustus and the Antonines. The feebleness of the uncultivated mind, which cannot rise above material conceptions, had indeed passed away; the legends of the popular theology had lost all power over the educated; but at the same time an absolute ignorance of physical science and of inductive reasoning remained. The facility of belief that was manifested by some of the most eminent men, even on matters that were not deemed supernatural, can only be realized by those who have an intimate acquaintance with their works.

Thus, to give but a few examples, that great naturalist whom I have so often cited (Pliny) tells us with the utmost gravity how the fiercest lion trembles at the crowing of a cock; how elephants celebrate their religious ceremonies; how the stag draws serpents by its breath from their holes, and then tramples them to death; how the salamander is so deadly that the food cooked in water, or the fruit grown on trees it has touched, is fatal to man; how, when a ship is flying before so fierce a tempest that no anchors or chains can hold it, if only the remora or echinus fastens on its keel, it is arrested in its course, and remains motionless and rooted among the waves. On matters that would appear the most easily verified, he is equally confident. Thus, the human saliva, he assures us, has many mysterious properties. If a man, especially when fasting, spits into the throat of a serpent, it is said that the animal speedily dies. It is certain that to anoint the eyes with spittle is a sovereign remedy against ophthalmia. If a pugilist, having struck his adversary, spits into his own hand, the pain he caused instantly ceases. If he spits into his hand before striking, the blow is the more severe. Aristotle, the greatest naturalist of Greece, had observed that it was a curious fact that on the sea-shore no animal ever dies except during the ebbing of the tide. Several centuries later, Pliny, the greatest naturalist of an empire that was washed by many

tidal seas, directed his attention to this statement. He declared that, after careful observations which had been made in Gaul, it had been found to be inaccurate, for what Aristotle stated of all animals was in fact only true of man.

## SCENE AT THE HOLY SEPULCHRE.

BUT my Copt guide came across me in my hiding-place, and thinking, doubtless, that one could be learning nothing of Jerusalem in a dark café, he insisted that I should go with him to the HOLY SEPULCHRE, where a grand mass was on the point of being performed. Passing through the narrow streets again, I entered into an open court, from the busiest parts of the bazaar, and found the avenues lined with pretty Syrian women, who offered for sale olive-wood rosaries and crosses, shells from the Dead Sea, oak of Mamre, boxes from Hebron, carved relics from the grotto at Bethlehem, and, in fine, souvenirs from every holy spot in Palestine; but I soon forgot their clamors, at the strange sight of the Turkish guard, as I turned an angle directly fronting the entrance to the Sepulchre. In the recess were, at least, fifty soldiers, heavily armed with great pistols and curved sabres; some were loling on mats, listening to tales of love and war, others were smoking and talking; but all this clanking of sabres, and gleaming of atagans, grated harshly on my most sacred pilgrim dreamings; but I soon learned that these guards of Turks were necessary to prevent the Christians from cutting each other's throats. It is, alas, too true! A pilgrim from one country believes the pilgrim from another to be a barbarian and a cheat, and is sure to be eternally damned: the monk of Madrid scowls on the monk of Gareb as on a man who is hurrying to his bed of everlasting fire, and the feeling between Irish landlords and tenants is fraternal compared with the bitterness of heart in which a Greek bishop speaks of an Armenian friar. Nothing but shrugs and curses—in a Galilean, not a Christian spirit—that men meet each at this tomb: Latin encounters Copt; Greek, Nestorian—each asserts that the other is an intruder into the Holy House—their salutations are scowls of hate, their worship is a scuffle. What wonder, then, that the scarred negroes and hired bashi-bazouks despise the Christians, and call them "dogs," when their presence is daily required to prevent a disgraceful fight? Let me give you an example: The Copts are worshipping before the shrine; long before they have finished their service of sixty minutes, the Armenians have gathered in numbers about their choir—not to join them in prayers, but to hum profane airs, to hiss the priests, and to jabber, jest, and snarl at their rivals—for the love of Christ. As the hour draws near for the first party to cease, the parties of the second part commence to crowd, and push into their places—one side trying to stay one second of time beyond their right—the other endeavoring to dispossess them a second before they are bound to retire—to steal an instant from the false, is surely a triumph for the true church. But the instant these priests and worshippers come to blows—an affair of candles, crooks, and crucifixes—the Turkish guard is amongst them, and the ferocious rivals complete their services under the protection of a line of Moslem matchlocks. "*Allah-il-Allah! There is no God but God, and Mohammed is His prophet!*" The Christians cry out: "Why has our ark been taken from us? Is the Turk a better guard for the Tomb of Christ than the Nazarene?" The facts answer. Under the Moslem rule, each and every tribe or people of the earth can come in whatever tongue or ritual they may use, and offer praises to our Father who is in heaven. How, under Christian rule? Would the Russian divide his privilege with a Frank? Would the Greek kneel with the Copt? The American Methodist with the Spanish Catholic? No. The vices of jealousy and hatred, born in the pride of creed, show themselves too plainly here, where, above all places on the earth, the hearts of men should be full of charity and love.

## CONSOLATIONS FOR MISGOVERNED NEW-YORKERS.

THERE is a great complaint of the burden of life in our metropolis. What between crushing taxes, exorbitant rents, municipal corruptions, thwartings of justice, discomfort of travel, brutality to animals, venality of politicians, and the

general insecurity of life and property, there seems much occasion for discouragement. Undoubtedly, if we permit ourselves to dwell too much upon these things, we shall form a very low estimate of the state of society in which we live. We have, however, found a partial corrective of the depressing effect of reading our daily newspapers, and which even affords a kind of dismal satisfaction in their perusal: it is in the contemplation of other states of society, which, we may fairly assume, are altogether worse. We have just raised our spirits by dipping into some descriptions of social experience in South Africa, and are half inclined to indulge in a little sneaking jubilation at the better state of things around us.

Three or four travellers, of irrepressible enterprise, have recently been exploring the Cannibal Caverns of the Transgaripe country, and give us some consolatory accounts of what they found there. Mr. James Henry Bowker, in the last *Anthropological Review*, describes what he discovered in the mountains near Thaba Bosigo, as follows:

"On turning to the right of this ledge the scene opened out in all its grandeur; and certainly, in all my life and wanderings, I have never beheld a more savage-looking place. The cavern is formed by the overhanging cliff, and its entrance, a long, rugged natural arch, extends along the whole face of the cavern, or nearly so, which is in length about one hundred and thirty yards, and its breadth about one hundred. The roof of this place, which is lofty and arched, is blackened with the smoke and soot of the fires of the savages who formerly inhabited it, and its floor, strewn with the remains of what they had left there, consisted of heaps of human bones, piled up together or scattered about at random in the cavern, and from thence, down the sloping face of the rock, as far as the eye could reach, the clefts and small level spots were white with the bones and skulls of human beings; skulls especially were very numerous, and consisted chiefly of those of children and young persons. These remains told too true a tale of the purpose for which they had been used, for they were hacked and cut to pieces with what appeared to have been either blunt axes or sharpened stones; the marrow-bones were split into small pieces, the rounded joints alone being left unbroken. Only a very few of these bones were charred by fire, showing that the prevailing taste had been for boiled rather than roast meat.

"You may guess the feelings with which I wandered about this gloomy sepulchre, and examined its various places of interest. One spot was pointed out to me, with rough, irregular steps, leading up into the interior of the cavern to a gloomy-looking natural gallery, and in this place, I was informed, were stowed away the unfortunate victims not required for immediate consumption. From this place it was impossible to escape without passing through the middle of the cavern, which they could not do without being detected.

"Horrible as all this must appear, there might be some excuse made for savages, driven by famine to extreme hunger, for capturing and devouring their enemies; but with these people it was totally different, for they were inhabiting a fine agricultural tract of country, which also abounded in game; but, notwithstanding all this, they were not contented with hunting and feeding upon their enemies, but preyed much upon each other also, for many of their captures were made from among the people of their own tribe; and, even worse than this, in times of scarcity, many of their own wives and children became the victims of this horrible practice. If a wife proved lazy, or quarrelsome, she was speedily disposed of. (This is very comforting, after a dolorous speech on the horrible oppressions to which the women of our country are subjected.) A crying baby would in like manner be silenced, and any member of the community showing signs of sickness, or bodily infirmity, would not be allowed to linger or to fall off in condition. Such were the horrible practices of this degraded people, and although it is now commonly reported that they have for many years entirely given up this diabolical way of living, I saw, while at the cavern, unmistakable evidence that the custom has not been altogether abandoned.

"There are still a good many of the old cannibals in existence." On the day that we visited the cavern, I was introduced to one of them, who is now living not very far from his former dwelling-place. He is a man of about sixty years of age, and (not to speak from prejudice) one of the most God-lost looking ruffians that I have ever beheld in all my life. There is one little episode connected with his life that I may

as well relate. In former days, when he was a young man, and residing in the cavern, he captured, during one of his hunting expeditions, three young women, and from these he selected the best-looking as a partner for life—the other two went to stock the larder. This union, notwithstanding the strange circumstances attending it, proved to be a happy one, the lady soon reconciling herself to her new mode of living, and settling quietly down in the cavern, where I was shown the corner which she and her husband formerly occupied; and her son, a fine strapping youth, brought us some milk on the day on which we visited the caverns.

"At one of these caverns we met with an old savage, who told us that he had formerly been at the cooking of about thirty people, when cannibalism was still in vogue, and he seemed greatly to regret that—

'The bigots of this iron time  
Had called his harmless life a crime.'

for he appeared to think that the objections raised to their former mode of living were unreasonable and uncalled-for.

"While we were at this place we heard rather a curious anecdote; it is as follows:

"Many years ago, during one of the raids made by the cannibals, several individuals were captured and brought into the cavern, and among them was a young girl of great personal attractions. After much discussion on the part of the savages, her life was spared, and she became the wife of one of the cannibals. After some time had elapsed the father of this girl received information that she was still alive, but detained in the cavern; upon hearing which he sought the aid of one of the missionaries residing in those regions, and together they proceeded to the cavern, where they made the necessary arrangements for the girl's return to her home, the father paying six oxen as ransom for his daughter. But she had not been very long at home before she again disappeared, and, upon inquiry being made, it was found that she had, of her own free will, returned to her friends in the cavern; strange to say, preferring their mode of living to that of her father, who was not a cannibal.

"There is another anecdote told of these people, which I will also relate, as it serves to illustrate their manners and customs, and to show how lightly they regarded human life:

"In former times, when lions were plentiful in these regions, they would occasionally (like the inhabitants of the caverns) choose the flesh of human game in preference to that of wild animals, becoming exceedingly troublesome in their nightly ravages to the inhabitants of the caverns, seizing and devouring many of them. To rid themselves of the lions, these people constructed stone-traps, and (shocking to relate) these stone-traps were baited with young children, whose sad wallings attracted the lions to the spot, when they would be taken in the snare, and the life of the child sacrificed."

These people, it seems, furthermore, attempt to make out a case in defence of their practices; but the ethics of cannibalism are not inspiring as matters of contemplation, any more than the ethics of our politicians at home. Indeed, at bottom, there is more similarity between them than one would at first suspect, as they both resolve themselves into a very unscrupulous self-interest.

## PUBLIC PARKS.

NOTHING in London produces a deeper impression upon the stranger than the extent of its country-element. Its half-dozen principal parks embrace some fifteen hundred acres of ground covered with trees and lakes, so that one may walk three or four miles through the town, through the chain of parks, and hardly be reminded that he is in the heart of the English metropolis.

For the existence of these parks, however, the English have to thank the old monarchy, as they were originally palace grounds reserved by the crown, and which have only been opened to the people, and virtually made over to their use, with the decline of royalty and the progress of democracy during the present century. The public at last gain the benefits, although that was far from the original intention.

New York, too, has its great park, the pride and pleasure

of its citizens. The whole island upon which it stands was bargained away, less than two hundred and fifty years ago, for twenty-four dollars; and, although a mere child in years compared with London, and not half as large, she has nevertheless, within a dozen years, purchased and beautified a tract of eight hundred and sixty-two acres; and she enjoys it, not by royal grace, but by the appreciation and resolve of the people. Brooklyn, also, has laid out magnificent grounds, and will soon rival New York in the extent and elaboration of its landscape display; while most of the other leading towns of the United States are planning or executing similar designs. Thus the work which was at first done blindly, and for mere kingly ostentation, is now done intelligently, and with entire reference to its manifold advantages to the community.

Chicago, of course, is not behind in this sort of municipal enterprise. Although a city of yesterday, and crowded with a population that "carries more steam," perhaps, than any other upon the face of the earth, they are, nevertheless, not without a feeling for the æsthetic side of things, and a far-sighted vision for the prospective interests of their rapidly-spreading city. As might be expected, too, from so practical a people, they are alive to the direct utilities of the subject, and seem to have reached a thorough consciousness of the special and urgent requirements of their city.

The most compendious and, at the same time, comprehensive statement of the importance of these institutions to large towns, has been made by Dr. G. H. Rauch, Sanitary Superintendent and Registrar of Vital Statistics of Chicago, in a paper read before its Academy of Sciences. It discusses, in a very lucid and instructive manner, the influence of public parks upon the moral, physical, and sanitary condition of the inhabitants of large cities. After a brief account of the parks in the chief cities of the world, the writer goes more fully into the question as it affects the citizens of his own town, and presents many interesting facts regarding its situation and physical relations. Located on the southwest shore of Lake Michigan, the land that stretches back from it is almost as flat and low as the lake itself. The average elevation for five miles around is but twelve feet above the water-level, while a large portion of the ground is depressed and swampy, with but little drainage. The land upon which the city stands is the ancient bed of the lake (which has receded far below its former level), and consists of sand-banks, clay-beds, and vegetable mould. "Such a soil must necessarily exercise a decided influence upon the health of those living upon it; depending, of course, upon the character of the beds upon which the houses rest. Sandy soils absorb and retain heat much longer; while the clay and humus absorb and retain but slowly. Sand absorbs and retains little water; clay twenty times more; and humus, or surface-soil, fifty times as much as sand."

From the flatness of the region, winds have an unbroken sweep, as there are no mountains, hills, or forests to arrest them. In an area of four hundred square miles surrounding Chicago, there are only twenty square miles thinly covered with timber. But, as even the enterprise of Chicago is inadequate to build mountains, and as hills also are excessively expensive, the city has but one way left to protect itself against its special exposure, and that is, to surround itself with artificial forests. Dr. Rauch discusses with much ability, and with admirable compression of statement, the relation of the different winds to health and mortality, the sanitary influence of trees and foliage, and the relations of climate to disease. Another aspect of the subject to which he draws attention is, the relation of parks to mental hygiene, and the special need which so over-excited a people as those of Chicago have for every kind of recreation and diversion. He says:

"We, perhaps more than any other community, need all possible safeguards against over-work to be thrown around us, and I know of no better way than by the creation of parks, that will be an ornament to the city, and places of resort, where

all may enjoy themselves in a rational and healthful manner. We need parks to induce out-door exercise, and for the pleasant influences connected with them, which are so beneficial to our over-worked business men, to dyspeptics, to those afflicted with nervous diseases, and, particularly, to the consumptive.

"We need parks for our school-children, as we have no places to which they can resort for out-of-door play, and where they can obtain healthful recreation, with the exception of the limited grounds surrounding the school-houses. They can also be made use of as the means of instruction, by the arboretum, botanical collections, and the collections of animals that are found in them.

"The moral influence of parks is decided. Man is brought in contact with Nature—is taken away from the artificial conditions in which he lives in cities; and such associations exercise a vast influence for good. In the Central Park, only five hundred and sixty-eight arrests have been made, and these of a trivial character, out of 30,731,847 visitors. 'The people of Baltimore have been their own conservators of the parks. They appreciate and enjoy them, and they preserve them. The appeal made to them by the commission, in the first year of the parks, has been most fully and honorably responded to.' We have no places of resort on holidays. By creating them, we take many away from other and worse places, and thus do much toward encouraging the young in habits of sobriety and temperance. They also afford a field for the exercise of those robust games which tend so much to the development of the physical system."

The peculiar circumstances and remarkable history of Chicago give great interest to its experiments and policy in relation to the subject here noticed.

#### TABLE-TALK.

WE have a Tract Society, with its headquarters in New York, and its agencies of collection and distribution in nearly every church in the land. It is American in name and scope, is thoroughly organized, collects money in vast amounts, and scatters its sheets like autumn leaves. The American Tract Society is devoted to those matters that affect the interests of a hereafter; and this is well.

But has not the time come for the organization of a corresponding institution, which shall have for its object the promotion of the immediate interests of people as to this world? There seems no reason to the contrary. Admitting the transcendent importance of those questions that concern the future welfare of the race, there are other interests which are nearly as sacred and imperative in character. Certainly there is need of every efficient means for improving the material condition of people here. Error, wrong, and suffering abound, and, while we have no Utopian hopes that they will ever be entirely extirpated from the earth, their partial removal we know to be possible and practicable. But it is neither from legislation nor from charity that amelioration must mainly come. It is from that enlightenment which shall enable the individual to put forth his own powers to better advantage and achieve his own improvement. It may be said, with as much truth to-day as it was said of old, "My people are destroyed for lack of knowledge"—not for lack of philanthropic schemes, or legislative enactments, or charitable bounty, but for lack of that living knowledge which men can use for guidance in the conduct of daily life.

For the attainment of this end, tract-agency is invaluable. Its mode of influence is legitimate and powerful. It implies brevity and pungency of statement. A great deal can be said in four pages under pressure, while the little messengers of appeal and instruction find people out in their odd moments of leisure to read and think. The agency, in fact, needs no vindication. Newspapers do something, but not what is wanted. They have interests of their own to advance. There is either a party or

a sect behind them, or they cater to ignorance and prejudice to get a sale. The tract may be free from these suspicions, and received and read in the best mood to get its benefit. Schools are good, but at present they stop short of their highest end. They are but a preparation for duties and opportunities which lie beyond; and nothing would better supplement their shortcomings, and give to common schools their best effect, than the wide dissemination of tracts, concisely written, authoritative in character, and devoted to applied knowledge. Whether a possible scheme or not, we do not say; but nothing would be more productive of solid good than a well-organized Humanitarian Tract Society.

M. Jules Verreau, the same distinguished naturalist who, after twenty-eight years of South African and Australian explorations, had the irreparable misfortune to lose, by shipwreck, his immense collection and accompanying manuscripts, has observed, in the habits of the Thynnes of Australia, the following curious fact:

The males of this hymenopterous insect are provided with wings; the females, smaller, have none. Nature begins, we see, far below man, in the scale of creation, to anticipate the fickleness of the stronger sex and the constancy of the fairer. The male Thynne is not, however, to be reprobated as a "gay deceiver." He may be seen flying off, bearing his female in his arms, or in what are arms to him, and holding her with the most delicate care. He is next seen placing her upon the flowers: alas! there is no happiness without its perils, and it often happens that other males, less fortunate, alight at the same spot, and declare that their "attractions are proportional to destinies." A struggle ensues for the application of the law, but the chivalric duel, to which, in higher species, the female and the victor owe so much, does not, among the Thynnes, protect individual prowess against the onslaught of numbers. Fearing to be overpowered, and unable to defend his darling against many rivals, this husband, by legitimate priority, concludes to eat her up.

This is a counterpart to that immoral custom witnessed among certain spiders who, from time immemorial, have possessed the most extravagant views of woman's rights. Some of these irritable Arachnes, upon the slightest fault which their entangling fancies can discover in a declaration of love, devour the unfortunate adorer. This cruelty would seem, indeed, essential to complete their satisfaction. They interpret the character attributed to Marguerite, the princess of the old Tour de Nesle. Both kinds of insects, however, surpass her in the perfection of their instinct; they assimilate the object of passion.

### Literary and Personal Notes.

AN extract from the Memoirs of Berlioz contains curious details regarding the difficulties with which the celebrated composer had to struggle at the outset of his career: "I had rented a very cheap little room on the fifth floor of a house in the city, on the corner of the Rue de Harlay and the Quai des Orfèvres, and, instead of dining, as heretofore, at the restaurant, I reduced my meals to a cenobitic system which made them cost, at the most, seven or eight francs. They consisted generally of bread, raisins, prunes, or dates. As it happened to be the fine season of the year, I generally went, after making my purchases at the store of the neighboring grocer, to the small terrace of the Pont Neuf, where I seated myself at the feet of the statue of Henry IV.; there, without thinking of the chicken in the pot, which the good king had hoped all his peasants would have for their Sunday dinner, I took my humble meal, seeing the sun in the distance descending behind Mont Valérien, following with my enchanted eyes the radiant reflexes of the waters of the Seine, which flowed murmuringly past me, and my imagination charmed with the splendid images of the poems of Thomas Moore, of which I had recently discovered a French translation, that I read with the utmost delight for the first time."

It is said that Bodenstedt, the charming German writer on Oriental subjects, and author of "Thousand and One Days in the East," a work of which every year several new editions are sold in Germany, did not think

of writing a book until an accident brought him in contact with Berthold Auerbach. The two distinguished men met, twenty-one years ago, at a restaurant in Vienna, at the very time when the guns of Prince Windischgrätz thundered against the gates of the old imperial city, which was then in the hands of the revolutionists. Bodenstedt told Auerbach and several other *littérateurs*, who were present, about his travels in the Orient, and spoke with so much eloquence and enthusiasm, that his friends became enchanted, and Auerbach exclaimed at last, "My friend, these things must not be told in the way you are doing now, but should be written in a book." "I write a book!" replied Bodenstedt, laughing, "I could not do that." However, he went immediately to work, and some time afterward published his "Thousand and One Days in the East," and German literature had gained another star of the first magnitude.

Henrick Scharling is a famous Danish writer, three of whose works have been translated and published in England. The London *Spectator* claims that he has few equals among English novelists. His last book is called "The Rivals; or, Love and War," which is described as in part a psychological study, in part a romance of the Danish War of 1848-'50. The character of the hero is in a measure typical of the finest side of the Danish character—"a character of dumb, inarticulate sentiment, apparently without self-reliance, unready for any practical emergency, full at bottom of the most deep-rooted doubts, musing forever on its own helplessness, and disbelieving as dreams half of all it hears from others." The delineation of this character, and the war-scenes in the latter part of the book, are both executed by the novelist with singular success, according to the opinion of English reviewers.

The most valuable collection of American political statistics, for the last thirty years, has been afforded by the *Tribune Almanac*, its reputation in this particular gaining with each year's issue. Recently, the series from 1838 to 1868 has been reproduced in two volumes of over 1,800 pages, making a complete *résumé* of our political history during that period. A special interest, moreover, attaches to the book in its being the first work reproduced by the recently-invented photolithography. The pages of the original work were not cast, and the cost of resetting them in type was too great to admit of reissue. By a recently-invented process, however, the pages were photographed on prepared lithographic stone, and printed therefrom by the ordinary process of lithographic printing. The work, hence, is not only valuable as a political register, but of interest as a curiosity.

"The Land and its Story; or, the Sacred Historical Geography of Palestine," by the Rev. Dr. Burt, is a recent addition to our literature of the Holy Land. It embodies the most valuable results of modern research, combined with the author's personal observations, and affords one of the clearest and most entertaining descriptions of biblical localities we remember to have read. The entire geography of Palestine is spread out before the reader as if in a panorama, and each locality, with all its wealth of sacred associations, is depicted with a vividness that is very noticeable. The book is compact as well as complete, and hence peculiarly commends itself to the biblical student, as well as to the general reader. It is supplied with maps, and fully illustrated.

### The Museum.

THE Phronima is a curious little marine creature, with funny ways, a specimen of which, fished up from the waters of the South Pacific, has been lately described by Major Holland.

The Phronima is a tiny crustacean, that is, it belongs to the crab, lobster, and shrimp family, which have the remarkable peculiarity of wearing their bones outside their bodies in the shape of a great number of jointed plates or rings.

Some of these creatures, as the crab, have feet adapted for walking on the beach or sea-bottom, which spring from the thoracic region of the body; others have limbs of locomotion—for swimming, which spring from the abdomen. Our little friend has both sorts, ambulatory feet on the thorax, and natatory feet, or *swimmers*, as they are termed, on the abdomen; it therefore belongs to the order *Amphipoda*—both-footed.

Its head is long and planted crosswise, that is, its axis is at right angles with that of the body. Some of the crustaceans have their eyes mounted upon the top of long stalks; the Phronima wears her eyes as we do, but has a great number of them, some on the back of her head, some in front, and others on each side. The mouth and the swimmers are of deep rich red color; the rest of the body is glass-like.

As regards the mode of life of this curious creature, it has this remarkable peculiarity—it carries its house on its head! One of its remote relations, the hermit-crab, as is well known, has a singular habit of entering into the occupancy of cast-off shells, having found one of suitable size by repeated trials. In the same spirit the Phronima mounts a little second-hand, transparent, barrel-shaped tube, open at both ends, which has first served the purpose of another marine creature and been

abandoned. This it carries with it, and looks for all the world like a new-boiled prawn, with its head and shoulders jammed into a mother-of-pearl thimble, and its tail flopping restlessly outside, sending it tumbling head over heels, as if making violent efforts to extricate itself.

Phronima—Tumbler of the Sea.

In the cut the Phronima is represented as disporting herself in a glass vase of sea-water. The figures are magnified, the real length of the tube, or case, being five-eighths of an inch, and its breadth half an inch. It is probably the female only that adopts this contrivance, which is made the receptacle of her ova, and becomes the apartment in which she brings up her family. The ova and the young are secured by a filmy band running round the interior, about half-way up it. They are indistinctly visible through the case, as shown in the illustration.

"The mother, when swimming, has her head and the first three segments of the thorax inserted into the tube, which she holds fast by means of the third pair of legs—which have been mentioned as being habitually thrown forward across the head—which have their claws firmly driven into the lining membrane of the case, in front of her head. The formidable "pinchers" of the fifth pair remaining outside "clear for action" in readiness to meet an enemy, and the swimmerets, on ordinary occasions, are busily paddling, as represented in the drawing. Sometimes, on the approach of danger, she draws the whole of her body within the tube, and, apparently to guard against the risk of being shaken out by the shock of a collision, drives the claws of the seventh pair of thoracic feet (which seem to be normally directed backward for the purpose) into the lining: the anterior (third) pair being, as we have seen, similarly directed forward; she has thus a firm "set" against a jerk coming either way. Her great compound eyes, placed not only in the sides, but in the top and back of her head, enable her to take in,

with one marvellously comprehensive glance, the whole circle of her brood; the objects of her maternal solicitude, they are never "from under her eye;" no human beings are under such complete and constant supervision as the fry of Phronima.

"The specimen from which our illustration was drawn, was kept alive for ten days. She was a creature of the liveliest habits, whirling about in rapid gyrations, and turning summersaults, tub foremost, with a very comical effect. She never progressed in right lines, but first ascended at an angle of about seventy-five degrees with her ventral aspect toward the spectator, then, suddenly twisting sharply toward the left, she threw her tail up, and came down head foremost at a like angle, bringing her right side and the back of her head into view. Sometimes she was seized with a mania for waltzing, spinning round and round without materially shifting her ground, like a buoy moored in a strong tide-way: merry little Phronima was often placed on the wardroom measurable by particular request, her strange antics affording much amusement: but she pined for the liberty of the free ocean, and drooped, and died "universally respected and regretted."

"It does indeed seem strange that the preservation of the species, the safety of the broods of this tiny inhabitant of the deep, should hang upon the apparently doubtful contingency of the mother picking up just at the critical moment a suitable piece of the broken skeleton of another and widely different creature: but the plans of the great Master-builder, however inscrutable to us, never fail; and we see, if we study the glorious pages of Nature's outspread book, intelligently and reverently, that the ends aimed at are ever infallibly attained."

SPECIAL REPRESENTATIVE,

CLIFFORD J. BALLYN,

53 Murray St., New York.

## NEW BOOKS.

I.

### TOMMY TRY, AND WHAT HE DID IN SCIENCE.

By CHARLES OTLEY GROOM NAPIER, F. G. S., author of "Food, Use, and Beauty of British Birds," etc. With Forty-six Illustrations. 1 vol., 16mo, cloth. Price, \$1.75.

"Tommy Try" is a book of popular science, having reference chiefly to botany and the habits of animals, and interspersed with a good deal of light story-telling and fun, with a view, we suppose, to rendering the science more attractive to youthful readers. The work reminds us somewhat of the "Philosophy in Sport made Science in Earnest" of the late Dr. Paris, which, many years ago, was so great a favorite with the boys who are now middle-aged men.—*London Review*.

II.

### APPLETONS' SHORT-TRIP GUIDE TO EUROPE, FOR 1869.

Principally devoted to England, Scotland, Ireland, Switzerland, France, Germany, and Italy. With Glances of Spain, Short Routes in the East, etc.; and a Collection of Travellers' Phrases in French and German. By HENRY MORFORD. One vol., 18mo. Cloth, flexible. Price, \$2.00.

III.

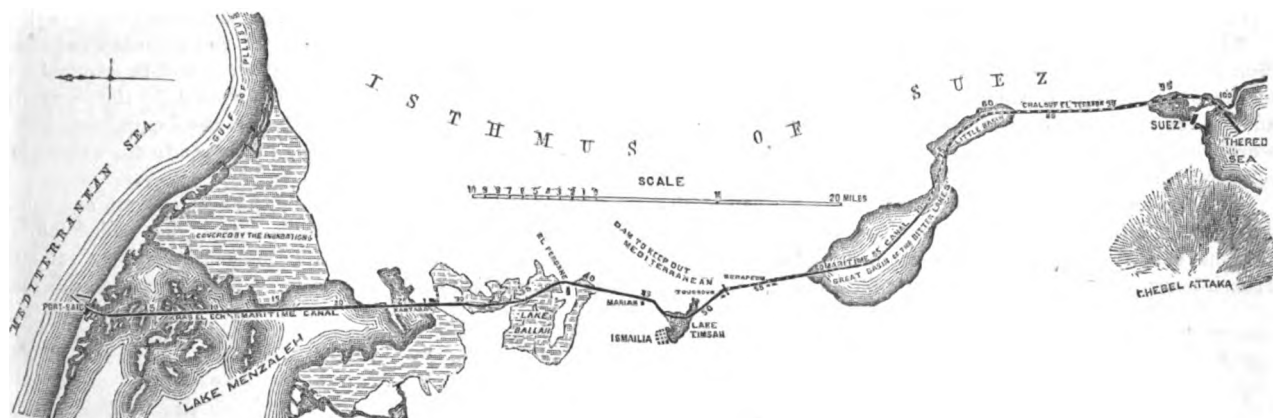

### CHEFS-D'ŒUVRE OF THE INDUSTRIAL ARTS.

By PHILIPPE BURTZ. Pottery and Porcelain, Glass, Enamel, Metal, Goldsmith's Work, Jewelry, and Tapestry. With numerous Illustrations. One vol., 8vo, 388 pp. Elegantly printed. In cloth. Price, \$6.00.

# THE SUEZ SHIP CANAL.

BY E. HEPPLÉ HALL.

**LONGITUDINAL SECTION.**

**Diagram and Profile of the Track of the Canal.**

IF we except the Great Continental Railway which now unites the Atlantic and Pacific coasts, and which, as a short-cut to the trade of the East, must be considered its most formidable competitor and rival, no great work of modern times has elicited so large a share of public curiosity, with apparently so little opportunity of having that curiosity gratified by actual observation, as the ship-canal across the Isthmus of Suez.

THE CANAL FIRST PROJECTED.—The first step toward the construction of the present canal was made nearly a quarter of a century ago. In 1846 a commission was issued to Robert Stephenson, son of the famous inventor of the locomotive, on the part of Great Britain; to Talabot, the great French contractor, on the part of France; and to Signor Negretti, the scientific chemist and engineer, on the part of Austria. During

### General Bird's-eye View of the Canal.

that year the isthmus was surveyed by them, and the scheme pronounced feasible.

The only serious impediment to the success of the undertaking which then presented itself, was the continual danger to which the canal would be exposed by reason of the sand-storms on the desert. To meet this difficulty various mechanical remedies were proposed, and the enterprise pronounced practicable. Yet nothing further was then attempted.

Eight years later, M. Ferdinand de Lesseps proposed to Mohammed Saïd the scheme of reopening the ancient canal of Sesostris; and it is mainly to the engineering enterprise and unremitting activity and energy of M. Lesseps that the world is indebted for the work, which now so rapidly approaches completion.

The first exploration of the isthmus, under his supervision, was made in December, 1854, and January, 1855, and the present line of survey, which was ascertained to be twenty-nine French leagues (about ninety English miles) in length, decided

Suez. The other lakes are called Timsah, Ballah, and Menzalah. The first and smallest of these has long been drying up. To deepen the channel through these lakes; excavate the intervening sections, which, previous to the operations of the company, consisted of arid, sandy, treeless, and almost trackless wastes, with an occasional stratum of calcareous blue clay running through them; and to build the jetties for the protection of the entrance from either sea, and which now form the harbors of Saïd and Suez, was really all the company had to do.

No locks or other artificial appliances will be required, and steamers of the capacity of those now used by the Peninsular and Oriental, and *Messageries Impériales* Companies, will, it is believed, be able to pass through from sea to sea without difficulty or detention.

**MECHANICAL APPLIANCES.**—A work of so vast and unique a character, as will readily be conceived, has called into requisition appliances for construction of a similarly extensive and original kind. Indeed, the machinery used on this canal

Elevators under Process of Construction.

on. In November, 1855, another international commission visited the isthmus, but beyond the publication of their report (June, 1856), little of consequence was accomplished until 1858, when *La Compagnie Universelle du Canal Maritime de Suez*, or, as it is familiarly known to English readers, the Suez Ship-Canal Company, was organized.

**GENERAL VIEW OF THE WORK.**—Let the reader imagine a vast ditch one hundred miles in length, three hundred feet wide at the top, one hundred to one hundred and fifty feet wide at the bottom, with an average depth of twenty-four feet, connecting four natural lakes, bisecting a sandy isthmus at its narrowest point, and discharging at either end into a large inland sea, and he will have a fair presentment of what the canal is, or rather is intended to be. These lakes are situated at distances ranging from ten to fifteen miles from each other, and form the natural boundaries, so to speak, of the several divisions of the work. The largest and deepest of these, called *Lacs Amers*, or Bitter Lakes, extend to within fourteen miles of

forms one of the most interesting features of the work. Nothing like it is to be found elsewhere. From the gigantic *drague à couloir*, down to the smallest *drague* (dredge), and from the ponderous *élévateur* to the smallest drill or hand machine, every thing is of the most costly kind and elaborate finish. Two hundred and eighty-five machines, representing a force equal to eighteen thousand horses, and consuming twelve thousand two hundred and nineteen tons of coal per month, work day and night on the canal. These machines are divided into sixteen classes, two of which are worthy of especial mention. These are the large dredges (*dragues à long couloir*), and the *excavateurs*. The former are similar in construction to the machines used for dredging-purposes in the British and American seaports and rivers, but they are larger, and have an enormous passage, or spout, attached. By means of a steam-pump attached to the lighter on which this apparatus is mounted, water is mixed with the earth brought up by the dredge, and the semi-fluid mass is discharged through

The Jetties.—Preparing and Shipping the Blocks.

this long pipe, or passage (*coulloir*), on to whatever spot may be selected. By means of this machine the sand can be discharged to any distance within two hundred feet beyond the edge of the canal. By this simple contrivance a continuous compact ridge of sand is formed along the entire length of the canal, and this serves to keep out the accumulations of sand which, blown by the frequent storms (*Shimaul* or *Krumseen*), from the surrounding desert, would otherwise be deposited in the canal, and utterly preclude all efforts to keep it open. The ridge thus formed is in some places fully fifty feet high.

**PORT SAID.**—The northern entrance of the canal is situated on the eastern shore of the Mediterranean, one hundred and twenty-four miles north of Alexandria, and thirty miles north of Damietta. Externally, its appearance is not unlike that of the majority of mushroom American towns similarly situated. It is an anomalous sort of place. Bounded northward by the ocean, and southward by the desert, it is equally the product of both. Viewed geologically, it is the practical result of a struggle between salt water and sand; commercially and socially, it is a compound of modern commerce and aboriginal (Arab) ignorance and filth. Little more than half a score of years ago, the site of the present town was a dreary, arid waste. Every necessary of life had to be brought by boat from Damietta; and now every comfort and many of the luxuries of life are easily procured, at all events in much greater abundance and with more facility than in the ancient city of Damietta. It contains nearly one thousand houses, and a population which, though, like that of Cairo (not the Egyptian, but the American Cairo), largely floating, may be fairly estimated at between eight and ten thousand. This population is thoroughly cosmopolitan in its character, for, small as the town is, it numbers representatives from all parts of the world. Every civilized and uncivilized country, apparently, sends its delegate to the Canal Congress. The activity and bustle of the place, heightened as they are by the picturesque effect produced by the motley groups of French, Egyptians, Arabs, English, Americans, Levantines, Italians, and Greeks, working harmoniously together, form its principal attraction. On the occasion of my first visit (October, 1867), I counted twenty-two large-sized vessels in the *avant-port*,

Between Kantara and El-Ferdane—The First Vessels through the Canal.

or basin. Most of these were from North-British seaports, and were freighted with coal and other supplies for the company. Hence the large floating population spoken of. By far the larger number (fully two-thirds) of the inhabitants, however, are employed directly or indirectly by the Canal Company, or by the contractors, Messrs. Boril, Lavalley & Co.

**THE JETTIES.**—Commencing at the northern end of the canal, the first feature of the work that will attract observation are the jetties. One of the chief difficulties apprehended by the early surveyors and engineers of the canal scheme was the choking up of Port Saïd by the Nile deposit, and these jetties have been constructed mainly with a view to obviate this difficulty, as well as for purposes of protection to the shipping seeking transit through the canal. They are two in number, known respectively as the East and West Jetty. The length of the latter will be two thousand seven hundred yards, and of the former two thousand yards. The distance between their respective ends will be about four hundred metres (one thousand three hundred feet), and they will form between them, it is estimated, a basin, or harbor, five hundred acres in extent, completely protected from wind or storm, and spacious enough to accommodate all vessels seeking transit through the canal. These jetties are constructed of what appear to be immense blocks of stone. They are not stone, however, but sand, dredged up from the bottom of the canal, mixed with hydraulic lime (*chaux du Thiel*), and then put into wooden cases, or moulds, and allowed to dry. The lime is quarried a few miles down the canal, there ground, and thence transported to the works. Eight mills are kept constantly grinding on this novel, unique, and really interesting process. After sufficient time has been allowed to form and harden them, the wooden

casings are removed, and the sun's rays, which in this latitude are intensely hot, complete the process of making the block. Two or three months suffice to harden them. They weigh twenty tons each, and cost about one thousand francs apiece. When sufficiently dry and ready for use, they are lifted up by a travelling steam-crane (*grue à vapeur*) on to trucks, passed to a tramway, and then pushed by a locomotive down to where the lighters are moored to receive them. They now take a short sea-voyage. After being transferred from the truck by another travelling crane, they are deposited in an inclined position, in rows of three, on another lighter, whence they are taken out to the position they are destined to occupy on the jetty, and there sunk. The rate of progress has been from thirty to forty blocks daily. Over fifteen thousand have been already submerged, and but little remains to be done to complete these magnificent piers. The dimensions of these piers, or jetties, are, twenty-six yards at the base, six yards at the summit, and twelve yards in height.

We now proceed to glance briefly at the several divisions of the canal:

**DIVISION OF PORT SAÏD (LAKE MENZALAH).**—This division is fourteen and a half miles long, extending from Port Saïd to Kilometre Twenty-three, and includes the heavy work on the jetties already described, and the deepening of the canal which lies through the middle of Lake Menzalah, which is itself only separated from the Mediterranean by a low, narrow ridge of sand. The labor performed in this division has been immense. Fears were entertained by many that the sand thrown up by the dredges, to form the banks of the canal, would be too weak to withstand the combined action of the wind and waves in the lakes, and that the canal would in consequence be liable to frequent interruption. Fortunately, these fears have proved

Section of Canal south of El Guise—Construction Trains.

groundless, and all cause for such apprehension is now removed. In this division 364,367 cubic metres were excavated during the month ending October 15, 1868, which, added to the previous excavation of 6,072,723 metres, left a then total of 2,766,049 metres yet to be taken out.

**DIVISION OF EL GUISE.**—This is the longest division of the canal, and includes all lying between Kilometre Twenty-three and Ismailia, a distance of thirty-five miles. The appearance of the canal, as far as Kantara, is like that on the first division, being as straight—to use a homely metaphor—as a bee-line.

South of Kantara, the work is very heavy, especially at El Guise. Here are the deepest cuttings, extending a distance of five miles to Lake Ballah. Out of a total of 29,859,044 cubic metres, upward of 9,770,037 yet remain to be excavated to

reach the maximum depth of the canal. Twenty-five dredges and an immense force of laborers are engaged upon this division, and they are taking out about 600,000 cubic metres per month. In some parts of this division, when the canal is excavated to its full extent, the perpendicular depth will be upward of one hundred feet.

**KANTARA.**—The second point of importance on the canal is situated at the southern extremity of Lake Menzalah. It occupies the site of Mijdol, famous in the history of the Exodus, and has long been an important crossing for the Syrian camel-trains. It is the principal town in this division, is twenty-eight miles from Port Said, and is usually reached by the mail-boats in about five hours.

In this, and in each other division of the work, a basin has been

Water-works near Ismailia.

View near Ismailia.

formed in the lake, where the surplus sand and earth are dumped by lighters, termed by the French workmen *gabares à clapets de fond*, and *gabares à clapets latéraux*.

**LAKE BALLAH.**—Eight miles south of Kantara, the canal enters Lake Ballah, and, soon after passing the little Arab village El-Ferdane, we reach El-Guisr. The plateau upon which this village (El-Guisr) stands is the most elevated point, and the cuttings the deepest upon the whole canal. The labor of twenty thousand Arab *fellahs* was required for two years in cutting a channel deep enough to float the steam dredges from the Mediterranean to this point, and in filling the shallow basin of Timsah, formerly fed by the overflowings of the Nile only. At El-Guisr we found excavators hard at work widening the canal, with construction-trains and locomotives drawn up on the bank for removing the earth more rapidly than it could be done by lighters in the canal. There is yet more to be done in this division before it is fit for the passage of large vessels.

**ISMAILIA (Lake Timsah).**—Ismailia, next to Port Saïd, is the most important point on the canal. It is not only the official headquarters of the company, but the residence of the principal officials. Until within a recent period, the offices of the contractors, MM. Borl and Lavalley, were also located here, but these have been removed to Port Saïd. The town is pleasantly situated near the northern shore of Lake Timsah, and is named after the reigning viceroy, Ismail Pacha, who succeeded his uncle, Saïd Pacha, in January, 1863. Though, like Port Saïd, it owes its origin and growth entirely to the canal, the contrast between the two towns is very marked. The fresh-water canal, from the Damietta branch of the Nile, originally extended as far as a town called Zagazig, about fifty miles to the westward of Ismailia, which was then looked upon as the limit of civilization and habitable villages toward the east. All beyond was sand, desert, and desolation, with wandering tribes of Bedouins to make the desolation dangerous. One of the first operations of the company was to continue the fresh-water canal to the east, and, from a point two or three miles west from the present town, then a howling wilderness, its fertilizing waters now flow through the desert to the sea. It has played an essential part in the construction of the ship canal. Indeed

Cuttings near Serapeum.

without it the latter could hardly have been built. Before it was finished, three thousand camels and donkeys were required to transport the Nile water necessary for the sustenance of the laborers. When finished, the Egyptian Government purchased it for two millions of dollars. It runs nearly at right angles to the Maritime Canal. Its width is twenty-six feet, and its average depth about four feet.

**DIVISION OF ISMAILIA.** — From Ismailia, southward, we enter upon the third grand division of the canal. This extends through Lake Timsah and the Bitter Lakes to Kilometre One Hundred and Fifteen. The northern end of the Bitter Lakes is sixty miles from Port Said. The lakes themselves are twenty-three and one-half miles long. Up to within a few months past, the navigation of the maritime canal did not extend beyond Ismailia; but, on the 18th of March last, the waters of the Mediterranean were admitted into the Bitter Lakes, and there is now uninterrupted navigation to the head of these lakes, and within fifteen miles of Suez, for vessels of ordinary tonnage. The cuttings at Toussoum and Serapeum, passed between Lake Timsah and the Bitter Lakes, are deep, and, next to those already seen at El-Guisr, the most difficult on the whole length of the canal. Our illustration was taken in the bed of the canal, at the latter place.

The Bitter Lakes constitute the most interesting feature of this division. They are estimated to contain nine hundred million tons of water, and it is expected that, from their size and situation, they will obviate the necessity of

locks to break the current, which would otherwise exist in the channel of the canal between the two seas. Through these lakes the canal flows, between banks of the entire width of three hundred and twenty-eight feet, until it enters the last cutting, about five miles from Chalouf, whence it follows the course of the ancient canal to Suez.

**DIVISION OF SUEZ.**—This division is twenty-eight miles in length. The principal points are Chalouf (El-Terraba) and Little Chalouf, or "Eighty-three," on the Fresh-water Canal, where there is a ferry established for the transit of the caravans and trains to and from Mecca.

The number of dredges at work on this division is small compared with that engaged upon the preceding sections, the nature of the work requiring a preponderance of hand labor. Upward of thirteen thousand men and one thousand donkeys are engaged upon this division. The majority of this large force are native Arabs (*fellahs*), and they work hard. In close and curious contrast to these simple carriers, the Titanic engines toil and puff as they drag their ponderous claws along through this vast ditch. Nowhere, perhaps, in the world, is the contrast between steam and man power more vividly presented than on this great work.

**SUEZ.**—Suez, situated at the head of the gulf of the same name, which is a prolongation of the Red Sea, and scripturally famous as the scene of the journey of the Israelitish hosts, has come prominently into notice of late years in connection with the overland route to India and China, and more recently as the southern terminus of the ship-canal. It is likewise the place of embarkation for the Mohammedan pilgrims from Egypt, and the countries of Northern Africa, on their way to the holy cities. The town is built on a low, sandy tract of land, and was formerly a most miserable-looking place. The canal-works here, as elsewhere, have already effected a wonderful revolution. The French may well exclaim, "*Nous avons changé tout cela!*" A magnificent dry-dock has been constructed, and the most extensive dredging and jetty-making operations are in progress. The dry-dock is upward of four hundred feet in length, and nearly one hundred feet broad, while commodious basins, for the secure anchorage of ships and steamers, are being formed in front of it. The new piers are being connected

with the railway to Cairo and with the town of Suez by branch-lines of railway. The Egyptian Government, shamed into activity by the gigantic works carried on by the canal company, is constructing piers and basins of its own at Suez, and, what was twelve years ago one of the filthiest and most indolent of Eastern cities, is now all life and energy.

**PRACTICAL RESULTS.**—In October, 1867, I came through the canal as far as Ismailia on the first steamer that had navigated it.

October 13th, of the present year, has been fixed as the day upon which it is to be formally opened to the world. It is announced that the Empress Eugénie, and perhaps the emperor himself, will be present, and that the *fêtes* and festivities, with which the day is to be celebrated, will be on a scale of magnitude and magnificence commensurate with the importance of the occasion. During 1868, 2,088 vessels, aggregating 674,048 tons burden, arrived at Port Saïd, and 270,000 tickets were issued by the Transit Service. According to the estimates of M. de Lesseps, this amount will be increased to three million tons per annum the first year after the completion of the canal, and that, during succeeding years, this amount will be doubled. But these estimates are based upon the successful completion of the canal, and the navigation of it by steamers drawing from sixteen to twenty-two feet water. The full purpose of the ship-canal will not be attained until the largest vessels are able to pass through it, from end to end, so that steamers from Liverpool, London, Southampton, Marseilles, Trieste, or Brindisi, may proceed, without trans-shipment of cargo or delay in Egypt, through the Red Sea to Bombay, Point de Galle, Calcutta, Hong Kong, Shanghai, or Yokohama, as may be desired. Freights to Port Saïd from British or French ports are no higher than to Alexandria, but, if unloading is to be gone through with at the former port, the heavy tolls through the canal, and the reshipment at Suez for the East, will outweigh the cost of transport by the present route round the Cape, and practically render the canal a financial failure. Whether it will ever pay its constructors as a commercial speculation, when fully dug out for the passage of large vessels, remains to be seen. M. de Lesseps and the French engineers, backed by French capital, have constructed the work. British commerce in the East must furnish the tolls and help to make it pay.

## MADAME DE POMPADOUR'S FAN.

FROM THE FRENCH OF ALFRED DE MUSSET.

### I.

IN 1756, when Louis XV., weary of the quarrels between the magistracy and the legislature, concerning the tax of two sous on a franc, or the tenth of all incomes, resolved to pass the edict, the members of Parliament resigned their offices.

Sixteen of these resignations were accepted, and the sixteen refractory gentlemen were immediately exiled.

"Could you see," asked Madame de Pompadour of one of the ministers, "could you see a handful of men resist the authority of a King of France, and look on calmly? Would you not have a poor opinion of him? Lay aside your robes of office, and you would see things as I do, M. le Président."

Not only did the exiles suffer from their insubordination, but their relatives and friends shared in their disgrace.

One of the king's amusements was the reading of other people's letters; to give himself this pleasure, he used to have his favorite read to him all that was of interest in the mail-bags, and,

under the pretext of performing for himself his own secret police service, he amused himself with the thousand and one intrigues which thus came under his observation; but whoever in the remotest degree was found to be connected with the leaders of the factious party was sure to be ruined. It is well known that Louis XV., with all sorts of weaknesses, had one strong point—that of being inexorable.

One evening, when he was seated before the fire, with his feet on the fender, and looking, as usual, very melancholy, the Marchioness de Pompadour, who was looking through a package of letters, shrugged her shoulders and laughed.

"What now?" asked the king.

"I have just come across," said she, "a most nonsensical letter; but it is a touching production, and excites my sympathy."

"How is it signed?" asked the king.

"It has no signature. It is a love-letter."

"And how is it directed?"

"That is the joke. It is addressed to Mademoiselle d'Annebault, the niece of my good friend Madame d'Esstrades. It was apparently for the sake of my seeing it, that it was stuffed in with these papers."

"And what are its contents?" persisted the king.

"All love, as I tell you. Vauvert and Neuflette are also mentioned in it. Are there any noblemen in those counties? Does your majesty know the families there?"

The king pri-

ded himself on knowing France by heart—that is to say, the French nobility.

Court etiquette, of which he had made a study, was not more familiar to him than the coats-of-arms of the aristocracy—a knowledge easily acquired, since it went no further. But he was vain of his familiarity with the nobility, who were in his eyes like the marble staircase of his palace—something to be used by their master to help him to ascend still higher. After having reflected a few moments, he scowled, as if suddenly struck by an unpleasant memory; then, motioning to the marchioness to continue, he threw himself back in his easy-chair, saying, with a smile:

"Read on; the girl is pretty."

Madame de Pompadour then, in playful mood, began to read a long letter full of love-sick passages.

"See," said the writer, "how Fate persecutes me! Every thing seemed favorable, and you yourself, my sweetest friend, had bidden me hope for happiness. Now, suddenly I must lose all, and that for a fault not my own. Is it not an excess of cruelty to have had the heavens opened before me, only to be plunged into the abyss below?"

"When an unfortunate is doomed to death, would it not be a barbarous torture to set before his eyes all which would make him regret death and cling to life? Yet such is my fate. I have no other place of refuge, no other hope, but the grave; for, from the moment of my misfortune, I dared no longer dream of possessing you. When fortune smiled upon me, my fondest hope was that you would be mine; now that I am poor, I should hate myself if I still wished you to share my fate, and, since I cannot make you happy, though I am dying of love for you, I forbid you to love me."

The marchioness smiled at these last words.

"Madame," said the king, "he is a fine fellow. But what prevents his marrying his lady-love?"

"Let me read on, sire:

"This crushing injustice surprises me as coming from the best of kings. You know that my father asked a place for me as cornet or ensign in the guards, and that on this depended my fate, since it would give me the right to offer myself to you. The Duke de Biron had proposed me; but the king rejected the application in a manner which is not very pleasant to remember. If my father has his own ideas of affairs—admitting that to be a fault—ought I to be punished for it? My devotion to the king is as profound and as sincere as my love for you. I would prove the truth of both these assertions, if I could do so, with my sword. It is discouraging enough to have my request refused; but that I should be so disgraced without any good reason is something so different from the usual and well-known kindness of the king—"

"Go on," said the monarch, "it grows interesting."

"If you knew how sad I am! Ah, my darling! this land of Neauflette, this garden of Vauvert, these groves—I walk through them all alone every day; I have forbidden the walks to be raked. The odious gardener yesterday came with his rake; he was just going to touch the sandy paths, where the impress of your light footsteps was yet remaining—the marks of your little feet and of your high-heeled shoes were still to be seen in the walk. They seemed to fly before me while I pursued your lovely form; and this phantom now and then seemed living, and rested on one of these fugitive footprints.

"It was there, in these long walks, that I learned to know you, to appreciate you—an admirable education, the mind of an angel, the dignity of a queen, with the grace of a nymph, thoughts worthy of Leibnitz clothed in the purest language, the bee of Plato on the lips of Diana—all these charms threw over me their magic, and I adored you. And during this time these well-beloved flowers blossomed about us. Listening to you, I inhaled their fragrance; their perfume was full of thoughts of you. But now they droop; they seem ready to die."

"Bah!" said the king, "it is a poor imitation of Jean Jacques. Why do you read me such stuff?"

"Because your majesty requested me to, for the sake of Mademoiselle d'Annebault's fine eyes."

"True enough; she has beautiful eyes."

"And when I return from these walks," read the marchioness, "I find my father alone in the grand drawing-room, leaning his head wearily on a lounge in the middle of the faded gilding which covers our worm-eaten wainscoting. He sees me enter sorrowfully; my

trouble makes him forget his own—Athenais! In the lower part of this room, near the window, is the harpsichord which your charming fingers have touched—those fingers on which once only my lips have pressed a kiss, while you were singing so sweetly that your song seemed a seraph's."

"How happy those composers are—Rameau, Lulli, Duni, and a host of others! Yes, you love their music; it lingers in your memory; its breath has passed over your lips. I seat myself near this harpsichord; I try to play one of the airs that you preferred. How cold and monotonous it seems! I let the sounds die away, and their echo loses itself in the arched roof. My father turns, and sees me unhappy; but what can he do? Idle gossip in the antechambers at court has imprisoned us in our château. He sees me young, ardent, full of life, asking only for a place of action in the world; he is my father, he adores me, and yet can do nothing."

"One would think," interrupted the king, "that this boy was just going into the chase, and that somebody had killed his falcon just as it was about to fly from his wrist. What ails the fellow?"

"It is true," read on the marchioness, "that we are near neighbors and distant relatives of the Abbé de Chauvelin."

"Ah! now we come to the root of the matter," said Louis XV., gaping. "Another nephew of these malcontents. My Parliament imposes upon my clemency. They all have such large families."

"But if this young man is only a distant relative?"

"No matter. This race is good for nothing. The Abbé de Chauvelin is a Jansenist. He is perhaps not bad at heart; but he has sent in his resignation. Throw the letter in the fire, and never let me hear of it again."

## II.

THESE last words pronounced by the king were not exactly a death-warrant, but they were almost a prohibition to live.

What could a young man do without fortune in 1756, if the king would not hear his name mentioned? Try to be a clerk, or to become a philosopher, or a poet? but without patronage, and in this case this last business would be but a poor one.

But literature was not the vocation of the young chevalier of Vauvert, who had written, with tearful eyes, the letter of which the king made a jest.

At this very time, alone with his father in the old château of Neauflette, he was pacing up and down the room with a countenance at once sad and furious.

"I am going to Versailles!" he exclaimed.

"And what can you do there?"

"I do not know, I am sure. But what can I do here?"

"You can be my companion. That is not, perhaps, a very attractive prospect for you, and I would not keep you here, if you could go elsewhere. But have you forgotten that your mother is dead, and that I am alone in the world?"

"No, my dear father, nor do I forget that I promised her to devote myself to your happiness. I shall return, but I must go away for a time. I cannot remain here any longer."

"And why not?"

"Because I am in love—desperately in love with Mademoiselle D'Annebault."

"You know that your love is hopeless. It is only in romances that marriages are made without fortune. Do you remember that I am in disgrace at court?"

"Ah, sir, I remember it but too well, but in due respect, may I not ask why you should be in disgrace? We are neither of us members of Parliament. We pay the tax, we do not levy it. If the Parliament haggles about the king's revenues, that is their business, not ours. Why should the Abbé de Chauvelin involve us in his ruin?"

"The Abbé de Chauvelin acted like an honorable man. He refused to vote for the income-tax, because he is disgusted with the extravagances of the court. Nothing like it has been seen since the days of Madame de Chateaux. She was beautiful at least, and she did not cost the nation any thing, not even what she gave so generously. She was both mistress and sovereign, and she said she should be satisfied if the king did not send her into a dungeon, when he was tired of her. But this woman, this Le Normand, this insatiable monster!"

"What is it to us?"

"What is it to us, do you ask? More than you think. Do you know that while the king devours our substance, the fortune of his *grisette* is incalculable? She made him give her at first one hundred and eighty thousand francs of income, but that was a mere nothing—it does not count at all now—you have no idea of the frightful sums she makes the king give her. There are not three months in the year, in which she does not cajole him out of five or six hundred thousand francs—now a tax on salt, now out of an increase on the perquisites of the superintendent of the stables. Besides the quarters which she occupies in all the royal residences, she buys La Selle, Cressy, Aulnay, Brinborion, Marigny, St. Remi, Bellevue, and a host of other landed estates, houses in Paris, Fontainebleau, Versailles, Compiègne, without mentioning large sums of money secretly placed in banking-houses in every country in Europe, in case of losing the king's favor, or of his death. And who pays for all this, if you please?"

"I do not know, but I am sure I don't."

"Indeed you do—pay your part—as does every man in France. The poor people pay for this, sweating blood and in tears—they cry out against her—they insult the statue of the king. And the Parliament are tired of all this, they are resolved to resist any new taxes. When money was needed for carrying on war, we were all ready with our last sou; then, no one thought of refusing to pay. The king, when he triumphed over his enemies, saw that his subjects adored him, and, when he was ill and nearly dying, he saw more clearly still that he had the hearts of his people. All faction, all party, all differences of opinion were forgotten. France fell on her knees by the king's bedside and prayed for him. But if we did pay without hesitation his soldiers and his doctors, we do not wish to pay his mistresses, and we have something else to do with our money than to keep Madame de Pompadour."

"I do not defend her, father. I cannot say whether she is right or wrong. I have never seen her."

"And, without doubt, you would like to see her, that you may form an opinion of her. At your age, the brain is influenced by the eyes. Try, then, if you choose; but this 'pleasure will be refused you.'"

"Why, sir?"

"Because it is vain to wish it. Because this marchioness is as invisible in her boudoir of Brinborion as the Grand Turk in his seraglio. Because you will find the doors shut in your face. What do you want to do? Attempt impossibilities? Seek your fortune like an adventurer?"

"No, like a lover. I do not intend to ask favors, but I will protest against injustice. I had well-founded hopes—almost a promise from Monsieur de Biron. I was on the eve of possessing the woman I love, and this love was a worthy one. You yourself approved of it. Let me, then, at least try to plead my own cause. Whether I shall do so before the king or Madame de Pompadour, I do not know, but I am going to court."

"You know nothing of the court, and yet you wish to go there!"

"Perhaps I shall be the more readily received there, for the very reason that I am unknown."

"You unknown! With your name and lineage! We are of the old nobility—we can never be unknown!"

"Very well, then the king will at least listen to my complaints."

"He will not even hear you speak one word. You think you will reach Versailles, when your postillion arrives there. Let me tell you, when you have passed the antechambers, the galleries, and are separated from the king simply by one door, that door will be an abyss. You cannot pass it. You will discover this, you will seek influence, protection, but you will not find it. We are relatives of Monsieur de Chauvelin, and how do you think the king will revenge himself for the abbé's contumacy? Exile for him as for the other members of Parliament, and for us a scornful word, or, worse, utter silence. Do you know what that is, the silence of the king, when with a disdainful glance, instead of speaking, he passes by you and annihilates you? Besides the Bastille and the scaffold, there is another sort of punishment which, less cruel in appearance, is equally fatal. The sentenced man, it is true, remains at liberty, but it is folly for him to dream of marriage, of a place at court, or in society, in camp, or in the church. Every avenue to place or preferment is closed before him, and he walks about apparently free, but really in

an invisible prison. This is what comes from losing the favor of the king."

"I will make such efforts that I will regain it."

"You will not succeed. The son of Monsieur de Meynières was as innocent as you are. He had, like you, promises and well-founded hopes of future success. His father, a loyal subject of the king, one of the best men in the kingdom, frowned upon by his majesty, went, the old gray-headed nobleman, not to beg, but to try to persuade the *grisette* to plead for him. Do you know what she said to him? There are her own words, which Monsieur de Meynières has sent me in this letter: 'The king's master. He does not think best to visit his displeasure on you personally; he prefers to make you feel it, by depriving your son of any position. To punish you in any other way would involve publicity, which he does not wish. His will must be respected. I pity you, certainly. I can enter into your feelings. I have been a mother, and I know what it must cost you to see your son deprived of all opportunity to distinguish himself.' This is the style of that creature, and yet you would throw yourself at her feet."

"They say that her feet are charming ones, father."

"Zounds! yes. She is not pretty, and people say that the king does not love her. Yet he yields to her, he succumbs to this woman. To maintain her strange power, it must be that she depends on something besides her plain face."

"They say that she has a great deal of intellect."

"And no heart—a fine combination."

"No heart, when she can declaim with so much feeling the poetry of Voltaire, and sing with such expression the music of Rousseau! She, heartless, who can play 'Alzire' and 'Colette!' It is impossible; I will not believe it."

"Go, then, and see for yourself, if you choose. I do not prohibit your going, I only advise you; but, I tell you, your journey will be in vain. Do you love this Mademoiselle d'Annebault so very much?"

"More than my life."

"Then go, my son."

### III.

It has been said that travelling weakens love, because of the new interests offered to the lover. It has been said also that travelling increases love, because of the opportunities it affords for reveries about the loved one. Our hero was too young to make such learned distinctions. Tired of the carriage, he exchanged it about half-way for a post-horse, and arrived, about five o'clock in the afternoon, at the Inn of the Sun, a name rather out of fashion since the days of Louis XIV.

There was, in Versailles, an old priest, who had once been a curate at Neaufette; the chevalier knew and loved him. This curate, quiet and poor, had a nephew, a favorite abbé at court, who might be useful to him. The chevalier went, therefore, to call upon the nephew, who, though a man conscious of his own importance, and in full clerical costume, nevertheless received the new-comer very kindly, and did not disdain to listen to what he had to ask.

"Luckily," said he, "you have come just at the right time. This evening there is a festival at the court, a sort of opera, or something, I hardly know what. I am not going, because I am *pouty* with the marchioness just now, in order to make her do something I want her to; but here is a ticket from the Duc d'Aumont, which I asked him to give me for somebody, I really have forgotten who. Never mind, you shall use it. You have not yet been presented, it is true, but, for a play, that is not necessary. Try to put yourself in the way of the king when he goes into the green-room. One favorable look from him, and your fortune is made."

The chevalier thanked the abbé, and, tired by his sleepless night and his horseback ride, he made a hasty toilet, such as suits people in love well enough. A servant, not particularly accustomed to such services, assisted him to dress as well as he could, and covered his spangled coat with powder in his zeal. He set out thus equipped to seek his fortune. He was only twenty years old, you see.

It was nightfall when he reached the palace. He went timidly toward the entrance, and asked the way of a sentinel. He showed him the grand staircase; there he learned, from the doorkeeper, that the opera had just commenced, and that the king, and of course everybody else, was in the grand saloon.

"If the marquis wishes to cross the court," added the servant, giving him this brevet title for want of a genuine one, "he will find

himself at the play in a moment. But perhaps the marquis prefers to go through the apartments."

The chevalier knew nothing of the palace, but curiosity led him to reply that he would go through the apartments; then, as a lackey approached to show him the way, an impulse of vanity made him add, that he did not need a guide. He went on, therefore, alone, but not without some palpitation of the heart.

Versailles was all ablaze with light. From the lower story to the uppermost one, the chandeliers, the girandoles, the gilded furniture, and the marble ornaments sparkled.

Throughout the palace, every door stood open, except those of the queen's private apartments. As the young man proceeded, he was struck with a wonder and admiration not easy to describe; for what made the spectacle most of all astonishing to him, was not merely its beauty and splendor, but the complete solitude in which he found himself. He seemed to be in an enchanted desert.

To be alone in a vast and grand building, whether it be a temple, cloister, or palace, does produce a strange and, I may say, a mysterious effect upon man. The edifice seems to weigh one down; the walls stare at him; the echoes listen to him; the noise of his footsteps seems an intrusive disturbance of the solemn silence, so that one feels a half-involuntary fear, and tries to walk noiselessly.

So our hero was at first impressed and subdued, but soon his curiosity gained the ascendancy, and banished all other emotions. The candelabras of the room of the mirrors shone with redoubled lustre. Thousands of loves, nymphs, and shepherdesses disported themselves on the ceiling, twining about the wainscoting, and wreathing themselves in one long garland about the entire palace.

Here were vast rooms decorated with hangings of velvet-and-gold, furnished in the stiff but elegant style of Louis XIV. There were ottomans and lounging-chairs scattered in disorder around gaming-tables; an infinite series of apartments entirely empty, but whose magnificence seemed the greater from the fact of their desertion. From time to time he came upon secret doors opening into silent corridors; a thousand staircases, a thousand passages, formed a seeming labyrinth; now he found himself among columns and platforms made for giants; now he passed into little boudoirs fit only for children's games of hide-and-seek; in one room he saw magnificent pictures of Van Loo hung near porphyry mantel-pieces, and, in another, articles of the toilet, puff-boxes, and the like, left carelessly in the keeping of fantastic Chinese images. It was a medley of solemn grandeur and of effeminate luxury, and everywhere, through all the splendor and the prodigal display, floated an atmosphere intoxicating and sweet, made up, as it seemed, of a thousand different odors, among which he fancied the perfumes of tropical plants and the sweet breath of women could be distinguished.

To be in such a place alone, in the midst of such marvels, at twenty years of age, was enough to bewilder any young fellow. The chevalier went on he knew not whither, as if in a dream. It seemed to him that one of the fairy tales of his boyhood, where some wandering prince finds an enchanted castle, was suddenly becoming real to him.

Could it be that mortals lived in this wonderful palace? Had actual women been seated in these arm-chairs, whose soft cushions yet retained the impress of the graceful forms which had leaned against them? Perhaps behind these thick curtains, or at the end of some long corridor, some princess might be found who had been sleeping for a hundred years, some fairy or some Armida might be hidden, or some hamadryad of the court might even slip away from the gilded ceiling or emerge from some marble column. Who could tell? Absorbed in spite of himself by these fancies, the chevalier sank upon a sofa to indulge himself in these dreams, and he might, perhaps, have forgotten himself entirely if it had not occurred to him very luckily that he was in love.

What was his lovely Mademoiselle d'Annebault doing, shut up in an old château all this time?

"My darling Athenais!" cried he, "why am I wasting the hours thus? Have I lost my reason? What strange spell has fallen upon me?"

He rose and proceeded across this new labyrinth, in which, it is hardly necessary to say, he soon lost himself.

He saw two or three servants talking together in a low voice at the end of a passage; he approached them, and asked the way to the theatre.

"If the marquis," said one, using the same title as the former servant had given him, "if the marquis will be so kind as to go down this staircase and take the first gallery at his right, he will find at the end of it three stairs which he must ascend; he must then turn to the left, and after crossing the Saloon of Diana, that of Apollo, the Muses, and that of Spring, he must go down again six stairs, and, leaving the guard-chamber on his right, go toward the staircase of the ministers, and he will meet there some guards who will show him the rest of the way.

"Much obliged," said the young man, "and with such plain directions it will be my own fault if I don't find my way."

He went on courageously, stopping once in a while involuntarily to look about him; at length, after a full quarter of an hour, as he had been told, he found more servants, and, on asking for fresh directions, was told—

"The marquis has made a mistake. He should have gone through the other wing of the palace; but it is very easy to retrace his steps; only go down this staircase again, go through the Saloon of the Nymphs, then pass the room of Summer, and—"

"I thank you," interrupted the young man. "I am a fool," he said to himself, "to be asking my way of every one I meet, like a booby. I gain nothing by it, for if they are not making game of me, which I half suspect, their pompous names of rooms and long-winded directions do not help me any."

He resolved, therefore, to go straight ahead, as far as he could, "for after all," said he, to himself, "fine, and grand and large as this palace is, it is not without limits, and, if it is three times as long as our hunting-park, I shall get to the end of it at last."

But it is not easy at Versailles to go for a long time straight ahead, and perhaps this rustic comparison of the royal residence displeased the guardian nymphs, for they began to puzzle our poor lover, and doubtless, in order to punish him, made him turn and twist so as always to retrace his own steps, and find himself every now and then in the same place; they utterly bewildered him in their labyrinth of marble and gold, till he felt like a rustic lost in a thicket.

In the Antiquities of Rome, there is a series of engravings by Piranesi, which the artist calls his dreams, and which are an attempt to describe his own visions during the delirium of a fever.

These engravings represent vast gothic halls. On the floors are all sorts of machines and engines, wheels, cables, levers, pulleys, catapults, etc., to express enormous power set in motion, and also formidable resistance. Beside the wall you see a staircase, and on this staircase climbing not without difficulty is Piranesi himself. Go up the stairway a little farther, and they stop short before a fearful chasm. Whatever may have been the fate of poor Piranesi, you fancy at least that his labors are at an end, but lift your eyes and you see a second staircase which lifts itself into the air, and up which poor Piranesi is still climbing, toward the brink of a second precipice. Look a little higher, and you will see still another staircase, up which poor Piranesi makes his eternal ascension, which again repeats itself till stairway and Piranesi are lost to sight in the clouds that form the border of the engraving.

This feverish allegory represents very distinctly the weariness of a useless toil, and the species of vertigo that such fruitless attempts cause. Our hero after repeated journeys from room to room, and from gallery to gallery, at last became enraged.

"Parbleu!" cried he, "this is unbearable, after being so charmed and so enthusiastic, to find myself alone in this cursed palace (it was no longer a glimpse into fairy-land), I find I cannot get out of it. Plague on the folly that induced me to enter here like Prince Charman with his magic boots of gold, instead of asking the first lackey I met to take me to the theatre!"

While giving vent to these tardy regrets, the chevalier was like Piranesi, half-way up a staircase on a broad landing where three doors opened.

Behind the middle one he heard a murmur so light and so pleasant that he paused to listen; at the instant that he stopped the folding-doors were thrown wide open; a puff of perfumed air, and a flood of light burst upon him, and so surprised him that he started back.

"Will the marquis go in?" asked the servant who had opened the door.

"I should like to go to the play," said the young man.

"It is just over, my lord."

At this moment many beautiful women, painted delicately in white

and red, and giving not their arm, not even their hand, but simply the tips of their fingers to their escorts, old or young gentlemen, began to come out of the theatre, taking great care to march sideways in order not to spoil their *paniers*. All this brilliant assemblage spoke in a low tone—merrily, to be sure, but with a sort of restraint.

"What is all this?" asked the chevalier, half divining what was about to happen.

"The king is about to pass," said the guardsman.

There is a certain sort of courage which is never shaken; it is the courage of ignorant people. Our young provincial, although ordinarily brave enough, did not possess this species of intrepidity; at the words "The king is coming," he stood motionless, almost helpless from excitement.

The King, Louis XV., who made nothing of riding on horseback a dozen leagues or more at one time, was, as every one knows, royally imperturbable. He boasted, not without reason, that he was the first gentleman in Europe, and his favorites said also, with truth, that he was the best-made and most elegant man of his time. Only to see him rise from his throne and walk a few steps, was a thing to be remembered. As he walked past his courtiers, with his arm resting on the shoulder of D'Argenson, while his red heels glided over the floor, a fashion of walking which he had introduced, all whispers ceased; the courtiers bowed their heads, hardly daring to salute their king, and the ladies, bending to the ground from the midst of their furbelows, made that coquettish obeisance which our grandmothers called "a reverence," but which has now been crowded out of fashion by the brutal "shake hands" of the English nation. But the king cared for nobody, and looked at only those whom it pleased him to notice.

Alfieri was perhaps present on this occasion; at any rate, in his memoirs, he gives this account of his presentation at Versailles:

"I knew that the king never spoke to foreigners unless they were very remarkable persons, but I was not prepared for the impassible and supercilious air of Louis XV. He surveyed a man from the crown of his head to the sole of his foot, and yet had the appearance of seeing nothing at all."

Yet it seems to me, if one said to a giant, "Here is an ant that I present to you," he would be likely to smile, or to say at least, "poor little insect!"

The taciturn monarch moved on amid flowers, beautiful women, and all his assembled court, preserving his solitude amid all that crowd. It did not take long for our young hero to understand that he had nothing to hope for from the king, and that the recital of his love-affairs would be utterly useless.

"I am an unhappy wretch!" he said to himself. "My father was right when he told me that at two steps from the king, I should yet find an abyss between him and me. If I should even venture to ask an audience of him, who would protect me? Who would present me. Behold him, the absolute monarch who with one word could change my destiny, secure me a fortune, give me all I most desire in life! Here he is, so near me that by stretching out my hand I could touch his garments, and yet, I feel farther from him than when I was at home in my native province. How could I approach him? How venture to speak to him?"

While the chevalier was absorbed in these sad reflections, he saw a young lady come in, whose beauty, grace, and archness attracted him in spite of himself. She was very simply dressed in white, without diamonds or laces, her only ornament being a natural rose in her hair. She was escorted by a gentleman perfumed and foppish as any court gallant could well be, and she talked with him in whispers behind her fan. Now as chance would have it, while talking, laughing, and gesticulating, this fan slipped from her hand, and fell under a chair exactly in front of our young chevalier; he sprang forward to pick it up, and, as, in getting it, he had been obliged to kneel, the young lady appeared so charming to him, that he presented it to her, still kneeling.

She paused, smiled, and passed on, thanking him only by a slight bow; but, at the glance she cast upon him, our poor youth felt his heart beat. And no wonder, for this young lady was no other than the "little nobody," as her discontented rivals called her, while others, speaking of Madame de Pompadour, called her "*the marchioness*," as one might say, "the queen."

[CONCLUSION NEXT WEEK.]

## IDLING IN THE ORIENT.\*

THE "Sentimental Idler" is a graceful writer and an agreeable companion. His pictures of the Orient have every character of an observing, philosophic, and dreamy wanderer. He would fain elevate the Idlers into an order, and he sets down rules for admission, that if always applied would certainly make his set the most agreeable of men. The Idler must be a gentleman, a man of education, a poet, and an artist; he must have good looks, gentle manners, and yet possess a Bohemian's love of vagrancy. "The winds in soft confidence whisper to us their secret pain; the landscapes show us their richest colors; the streams sing their sweetest music; the very flowers employ a rare speech, while the lowly among men disclose to our order their unappreciated but lovely lives. Beauty reveals herself in a thousand entrancing ways, and leads us step by step within the most sacred portals of Nature, by paths untrodden by less daring men."

An idle life in the Orient is one full of charms; it has every element of the picturesque, and if we glance through the pages of our traveller's narrative we shall find many a quaint experience, or strange adventure, or graphic description of places and people. The first portion of his narrative is of Constantinople, and he gives us this picture of

### TURKISH LIFE.

In a Mohammedan household all the luxury is reserved for the harem. In the odalisque are kept the soft carpets, the brilliant rugs, the silken embroideries, the mirrors, the fountains, the polished woods; for here is lived the life of intimacy and secrecy into which not even a friend or relative can enter. Turkish life is sealed so completely, that it is not only difficult but nearly impossible to know what passes behind the finely-trellised windows, and for this reason and the absolute government of the Turks in their houses, I can readily believe those stories of terrible cruelties and crimes committed by the barbarous masters on wives and slaves; in fact, as an active criminal agent, poison is in frequent use, and I have heard Turks talk of the *strong coffee* with a cool and terrible emphasis. Talking to a Turk of his wife or the female members of his family is to commit the most gross impoliteness, and banished from the subject of social conversation are all those polite inquiries of "How is your wife's health?" etc. In fact, the wife of one of our ambassadors, in presenting some beautiful presents to one of the pachas, which of course were intended for the lady-members of his household, used words such as "Here are the stuffs which you know better than any one how to employ!" Therefore, it is one of the incongruities of this strange people, that, being the most barbarous, gross, and selfish, they yet can have their susceptibilities wounded more quickly than any other people in the world.

### LOVE-INTRIGUES IN EGYPT.

An Egyptian girl or woman, concealed behind her *shu-bak* (window), sees pass a man who pleases her fancy. She calls, and, as the head of the unknown is raised, a flower, a note, or a handkerchief, is dropped at his feet. This is not yet a rendezvous, but an invitation to come again near the same place. At the moment the favored one leaves the spot, the door opens, and a eunuch or negress follows him. This servant is charged to know who he is, where he rests, what is his name, and condition in life.

The day after, in passing by the same house, if a flower, or other token, again falls from the same window, the lover knows that the report of the servant is made, and that his suit is favorably received.

"Now," adds Mahmoud (I translating into fairer English his odd expressions), "is the dangerous time. Sometimes at the café, sometimes in the street, you are met by an old woman, who tells you that such and such a man has a beautiful daughter, who wants to be married. She has the beauty of a princess, and all the charms that can tempt the imagination."

\* Letters of a Sentimental Idler, from Greece, Turkey, Egypt, Nubia, and the Holy Land. By Harry Harewood Leech. New York: D. Appleton & Co.

"I wish to see her!" says the lover.

"Impossible," replies the old dame. "Gaze upon the beauty of a child of the faithful before marriage—Mohammed forbid!"

"I wish to see her," repeats the lover, unmoved, and he slips a piece of gold into the woman's hand.

"You shall behold the glory of her eyes," replies the woman, softened.

"No,—more," repeats the lover, and another backshish is pressed on the woman.

"You shall behold her rosy mouth, filled with teeth beautiful as the pearls on the sultana's neck."

"More!"

And, at the third gold-piece, the woman leaves the lover, saying, "You are a prince, and I am your slave!"

From that moment the interview is determined on.

The best occasion is generally that of the mosque or the baths. In the shadows of the former, at a proper moment, the girl will remove her veil, even so far as to expose her neck and shoulders, that is, if some jealous eunuch is far enough away. As to the bath—this is a thing more full of danger and coquetry. The master of the bath is nearly always in the intrigue. He has two *backshishes* to gain: one on the part of the woman, another from the lover. The eunuchs, or slaves, rest at the door of the bath. These immense halls have a cupola on high, pierced with a thousand little holes, each of which is supposed to be covered with glass; but the lover discovers that some are not thus closed, when he is led by the master to the roof of the building, where, if he be wise, he will be able to judge of the beauty of the woman he loves, as she rests in all the charming *négligé* of the bath-toilet.

#### FATTENING THE BRIDE.

I must not forget to note a curious preparatory operation. One month, often before the marriage, they commence to fatten the bride. This is done by farina, cooked almonds, fruits, butter-and-sugar confections, and every substance conducing to obesity: the standard of Arab beauty is contained in one word, *fat*. Pending this time, the poor brides are given but little to drink, some drops of sugared water only being allowed, each day, by their hired fatteners. Among the poor, this operation is only followed for eight or nine days—it is expensive; and the bridegroom must be content with a more meagre wife.

#### A VILLAGE ON THE NILE.

I have just come aboard from a wilderness of crumbling mud huts almost buried amongst the palms—miserable hovels, with rude holes for doors, and twisted palm-mats for roofs; inside and out sit groups of women, whose faces though unveiled are tattooed with blue figures, and are horrible to look upon. In Egypt, as in more cultivated lands, you may take it as a rule that those who are most anxious to cover their faces are the old hags; and indeed the lot of woman is a lamentable one here, for while obliged to share the affections of her husband with others in this world, she is supposed to be put aside for the *houris* in the next. Indeed, many ulémas claim that women have no souls, and that their only chance of immortality rests on the tradition of Mohammed's conversation with the old woman who imported him for a place in Paradise.

"Vex me not," said the husband of Cadijah, "there can be no old women in Paradise—"

But when the ancient wife sent forth her lamentations, the diplomatic prophet added, "because the old will be all made young again!"

But I must not wander from descriptions of the village. Naked little children, almost all of them hopelessly afflicted with the ophthalmic curse, lay in dust-heaps in front of their cabins; the larger ones were playing at *koora* with stones and crooked sticks, but they soon left this sport to join the old men who followed us with whines and prayers for backshish. The Traveller coolly shot his pigeons from the family stock in the centre of the town, which raised a clamor among the women, only to be allayed by a few copper piasters. In a line along one of the less crooked avenues were people sitting in the dirt, exhibiting for sale eggs, brass and copper trinkets, gaudy handkerchiefs, beads, bread, and rice, and making a noise, in bargaining and selling, like unto twenty flocks of geese. Proud-looking Bedouins, mounted on sleek mares, rode through the town, brandishing, with a sort of warrior air, their long spears. Women, probably the dancers or *almées* of the town, sat with fierce-looking men in front of the

cafés; they were dressed in scant blue-cotton gowns, but with legs and breasts bare; they wore head-dresses, arm, breast, and leg ornaments of silver and gold coins; generally they were tattooed, but their large, velvety eyes were gentle as those of animals, and soft and tender as the gazelle's.

#### AN EGYPTIAN DANCE ON THE NILE.

When the girls arose, the grace of their forms was visible; they had on their professional dress worn in the village, which consisted of a short embroidered jacket, fitting close, but open in front, exposing their bosoms, on which hung strings of glittering ornaments; long loose trousers of transparent silk, a thin sash of cashmere twisted around the loins, rather than the waist, and slippers of red morocco with upturned points, completed the costume. Their hair hung in long braids down their backs, and hundreds of small gold coins were twisted in it, and sparkled as well in glittering circlets over brows, as around necks and arms. Their eyelids were delicately painted with *kohl* so as to make them almond-shaped and—languishing; and they advanced to the centre of the boat with a certain symmetry that was in harmony with the music. As they took their places, they threw off their slippers and commenced the movement, keeping time to the notes of the reed-pipe, and accompanying it with the clapping of castanets which were fastened to the thumb and fore-finger of each hand. There were three of them young and beautiful; the others were hideous, with rat's eyes, flaccid cheeks, and tattooed chins, so I contented myself with watching the most agreeable. They danced in groups of two or four, and then agitating their copper cymbals around and above their heads, they advanced right and left, circling, curving, and retreating, until a sort of prelude was finished, when joining the orchestra, who set up a dismal, melancholy song, they began a movement of the body almost impossible to describe. Their limbs seemed to be seized with a trembling, but they moved not from their position, while the upper parts of the body swayed and turned in a sort of dancing trepidation, becoming more and more agitated in time to the music and wild singing; and their breasts feigned with immodesty the most sensual physical emotions, until they seemed almost to exhaust themselves in an audacious ecstasy.

The delight of following the Idler through the lands where boundless fertility and eternal sunshine or starlight invite to indolence and repose is only second to his own. Then we escape the beggars and the Arabs and the fleas, which he did not escape, and we discover with him that in the idlest travel there is much to see and to know. Peculiarly is this so as we are propelled by sails and oars up the Nile, which is sometimes a calm lake, and again a rushing torrent; and where the slaves of to-day toil, as did Israel in their bondage, beneath the shadows of those grand temples which, perhaps, the children of Israel helped to build. Finally, the oars and the sails carry the Idler and his companions beyond the fertile valley which is yearly baptized by the soil-laden torrents from the lakes of the Mountains of the Moon, and they glide between the sandy deserts and the palms where once the kingdom of Nubia formed a part of Egypt's double crown. At last Egypt recedes from view, and they are nearing Ethiopia.

#### THE FIRST CATARACT.

The river narrowed between the black crags, and the water boiled in the curving channels. Sometimes a rocky pyramid uprose from the shining desert plain; sometimes our sight was shut out from the barren hills by some spot of vivid verdure, shadowed by acacias, palms, or sycamores; at other moments the sloping, sandy hollows were of deep gold, and seemed to be held in the crucible of rocks, whose volcanic origin caused the latter to shine like polished copper in the sun; sometimes the wastes of sand were white, and looked like snowy tracts lying under the moon. Past all these kaleidoscopic changes, we entered upon the seething waters, and, resting at the foot of the first fall, which the natives call the "Little Door," we beheld a sight so strange that my pen can but imperfectly depict it to you.

As far as the eye could reach, on every brown jagged rock, amid the boiling waters, and along the distant winding shore, uprose, as if by magic, hundreds of naked natives, of all ages and sizes, who, having evidently waited for our appearance, now joined in the work of fastening strong hawsers to our dahabééh, accompanying their labor

by songs, shouts, and curses, and making a confusion which he only who has travelled in the Orient can understand. Scores of men and boys dashed into the foaming torrent, some on little round logs, and some without, all beating the waves with their feeble arms. They somehow contrived to steer themselves through the foamy cataract and reach our boat, on which they clambered, dripping, grinning, and naked, shouting "Backshish! backshish!"

I beheld, with amazement, one after another of these Nubians spring into the flood, shoot down the rapids as if it was only sport to them, and, paddling with either hand, reach any given rock. Many trust themselves without their log, and they apparently stand upright in the waters which whirl them past as on the back of some mad foaming charger; these fellows fasten their only garment (the waist-band or girdle) on their heads, in the form of a turban, when they go into "*El-Bab*," or the smaller cataracts, and then they seemed to me like great black painted idols, which, in the crash of the world's millennium, were being hurried on by some Scamander to join the Sphinxes in a strange inferno. What forms they had! As they came on deck dripping with water, and their skins shining like some dark polished metal, each would have been a worthy model for the sculptor. But I had no time to notice further these strange beings, for our good *Bund* had recoiled at the foot of a fall, and the ropes were brought in play to pull her up and over it; the foam was flung over her bows as she was dragged through the waters, and if, for an instant, the ropes had given way, we would have been dashed into splinters against the rocks in the flood. "*Wallah! wallah!*" "*Fallough, fallough!*" shouted the chiefs on the tops of the rocks, and the dark surging masses of Nubians, on each side, answered in chorus, "*Haylee sdh!*" (God help!) Now we were below a ridge, over which it seemed impossible to drag our large boat; the waters were heaped up over it, as upon a cataract's brink, for a final plunge, and our craft trembled, but moved not over it: every nerve was strained; the hawsers were twisted around the rocks ahead of us, but we gained not an inch; the shouts of the unearthly figures around us, the wild motions and shrieks of the two réis' of the cataracts, with the roar of the waters, made up a scene of savage strangeness impossible to depict. Just at this critical juncture, and at a point where a dahabée had been wrecked two years before, our left bow-hawser gave way from the rocks (having been too quickly and insecurely fastened by the men), and, like a shot, we veered round, the waters dashed over our deck, and we only hung trembling by our *one* rope: if that had gone, we should have been precipitated against the rocks. The shouts of the natives were deafening; the gestures of the chiefs frantic—fifty athletes dashed into the cataract and swam for the missing rope, and finally, one old man brought forth the end in his teeth like a great grizzly dog—it was soon again fastened, and we were safe. Another pull, "*Haylee sdh, haylee sdh!*" and we felt ourselves slowly ascending the steep, though sights and sounds were overwhelmed by the rush of waters which sparkled over and thundered around us. One minute more—painful suspense—sustained struggle—and we were over, and tied to the rocks in the minor falls.

## THE MAN WHO LAUGHS;\*

OR,

## BY THE KING'S COMMAND.

BY VICTOR HUGO.

### BOOK II.—GWYNPLAINE AND DEA.

#### I.

A SIGHT OF THE MAN'S FACE, WHOSE ACTIONS ONLY HAVE BEEN SEEN HITHERTO.

NATURE had been prodigal in her gifts to Gwynplaine. She had given him a mouth stretching from ear to ear, ears coming forward upon his eyes, a shapeless nose adjusted for balancing the spectacles of a grimace-maker, and a countenance that you could not look at without laughing.

We have said that Nature had showered her gifts upon Gwynplaine. But was it Nature?

Had she not been aided?

A pair of eyes shining apparently with a borrowed light, a vacuum for a mouth, a snubbed protuberance with two holes that were nostrils, a squashed mass by way of face, and all this producing a joyous effect—it is certain that Nature, of herself, cannot produce such masterpieces.

Only, are laughing and joy synonymous?

If, in presence of this buffoon—for a buffoon he was—you let your first hilarious impression pass off, and observed the man closely, you would recognize in him the trace of art. Szch a phiz is not accidental, but designed. It is not in Nature to be perfect to this point. Man can add nothing to his beauty, but every thing to his ugliness. You can't make a Roman profile, out of a Hottentot profile; but out of a Greek nose you can make a Calmuck nose. It was not unadvisedly that the low Latin of the middle ages invented the verb *denasare*. In Gwynplaine's childhood, had he been an object of so much attention, that some one was interested in him to the extent of modifying his visage? Why not, were it only for purposes of exhibition and speculation? According to all appearance, certain laborious handlers of children had been working upon his countenance. It seemed evident that a mysterious and probably hidden science, which bore to surgery the relations of alchemy to chemistry, had chiselled this flesh, certainly at a very early age, and made up, with premeditation, this physiognomy. This science—skilled in quarterings, in obstructions, and in ligatures—had slit the mouth, sundered the lips, laid bare the gums, distended the ears, jumbled together the cartilages, misshaped the eyebrows and the cheeks, enlarged the zygomatic muscle, smoothed over (as with a stomp in drawing) the seams and scars, brought back the skin over the lesions, while keeping the surface agape—and, from this valid and deep sculpturing, had come forth the mask, Gwynplaine.

No one is born thus.

At any rate, Gwynplaine was a perfect success. Gwynplaine was a boon conferred by Providence upon the sadness of man. By what Providence? Is there a Demon Providence, as there is a God Providence? We suggest the question, but do not attempt to answer it.

Gwynplaine was a mountebank. He exhibited himself in public. None other could approach him, for effect. He cured hypochondriacs by simply showing himself. People in mourning kept out of his way, discomposed as they were and forced into indecent laughter, if they caught sight of him. One day, the executioner came, and Gwynplaine made him laugh. You saw Gwynplaine, and you held your sides; he spoke, and you held your sides; he spoke again, and you fell down in a fit of laughter. He was the antipodes of chagrin. Spleen was one extreme; Gwynplaine the other.

Thus, at fairs and in public places, he had rapidly achieved the very desirable renown of a man-monster.

It was in laughing that Gwynplaine made others laugh. And, nevertheless, he did not laugh himself. His face laughed—not his fancy. The exceptional sort of visage, that chance or a quaintly special calling had fashioned, was all that laughed. Gwynplaine had nothing to do with it. What was without was not dependent on what was within. This laugh—that he had not himself imprinted on his forehead, on his cheeks, on his eyebrows, on his mouth—he could not remove from them. An everlasting laugh had been stamped upon his countenance. It was a compulsory laugh, and so much the more irresistible, that it was petrified. No one could sneak away from this grin. Two movements of the mouth are catching—the laugh and the yawn. By virtue of the mysterious operation, probably undergone by Gwynplaine in childhood, every portion of his face contributed to this grin; all his physiognomy tended thitherward, as the spokes of a wheel toward the hub; all his emotions, of whatever kind, augmented—or, we should better say, aggravated—this uncouth semblance of gayety. A surprise coming upon him, a pain felt by him, anger taking hold

\* Entered, according to Act of Congress, in the year 1869, by D. APPLETON & Co., in the Clerk's Office of the District Court of the United States for the Southern District of New York.

of him, a sense of pity that he might have experienced, would but have increased this hilarity of the muscles. If he had cried, he would have laughed; and whatsoever Gwynplaine did, whatsoever he desired, whatsoever he thought, so soon as he raised his head, the crowd, if crowd there were, had before its eyes this apparition—a convulsive burst of laughing.

Figure to yourself a Medusa's head—jocund!

All that might be on the mind was put to rout by this unexpected air; you must needs laugh.

Ancient art was wont to display, upon the front of theatres, a face in brass, joyous. This face was called Comedy! The bronze seemed to laugh, and provoked laughter, and was pensive. All the caricature that leads up to madness, all the irony that leads up to wisdom, were condensed and amalgamated in this visage. The aggregate of cares, of disillusion, of disgust, and of sorrows, stamped itself upon the impassible forehead, and gave forth that lugubrious total—mirth. One corner of the mouth was drawn up, on the human side, by mockery; the other corner, on the divine side, by blasphemy. Men confronted, in this model of ideal sarcasm, the ironical mirror that every one has within himself; and the crowd, renewed unceasingly around this persistent laugh, was charmed with the sepulchral immobility of the giggle. Of this sombre dead mask of antique comedy, adjusted to a living man, it might almost be said that it was Gwynplaine. On his neck he bore the same infernal head of unpying hilarity.—An eternal laugh—what a burden for the shoulders of a man!

An eternal laugh! Let us understand each other, and explain. According to the Manichæans, the absolute yields at intervals, and Divinity itself is not without intermission. Let us be explicit, also, touching the will. We do not admit that it can ever be entirely powerless. All existence resembles a letter, which the postscript modifies. For Gwynplaine the postscript was herein: by force of will, and in concentrating all his mind, and on condition that no emotion intervened to distract him and unbend the fixity of his effort, he could succeed in suspending the eternal grin upon his face, and in throwing over it a sort of tragic veil. Then there was no more laughing before him; men shuddered.

Let us add that Gwynplaine scarcely ever made this effort, for the fatigue of it was painful and the tension hard to bear. Besides, it was sufficient that there should be the least distraction or the least emotion, for the laugh—chased away for a moment—to reappear, irresistible as the tidal reflux, upon his face; and so much the more intense was it, as the emotion had been powerful, be it what it might.

With this restriction, Gwynplaine's laugh was eternal.

People saw Gwynplaine; they laughed. When they had laughed, they turned away their heads. The women, above all, were horror-struck. The man was frightful. The jocose convulsion was, as it were, a tribute paid; it was joyously undergone, but almost mechanically. After which—the laugh once chilled—it was intolerable for a woman to see Gwynplaine, impossible to study him.

Beyond this, he was tall, well made, agile, and in no way deformed save in countenance. This was an indication, furthermore added to the presumption that there was to be seen, in Gwynplaine, rather a creation of art than a work of Nature. Gwynplaine, handsome in figure, had probably been handsome in face. At birth, he must have been like any other baby. They had kept the body intact, and had only touched up the face.

Such, at least, was the probability of the case.

They had left him his teeth. The teeth are requisite in laughing. The death's-head keeps them.

The operation performed upon him must have been fearful. He had no recollection of it, which was no proof that he had not undergone it. This surgical sculpture could only succeed upon a child very young, and, in consequence, having little cognizance of what happened to it, and easily capable of mis-

taking a wound for a sore. Besides, in those days, be it remembered, means for putting the patient to sleep, and for suppressing pain, were known. Only, at that period, they were called magic. Nowadays they are called anæsthesia.

In addition to this physiognomy, those who brought him up had provided him with the accomplishments of the gymnast and the athlete. His joints, usefully dislocated, and adapted for bendings backward, had received the clown's training, and could, like the hinges of a door, move themselves in either direction. In fitting him for the mountebank's trade, nothing had been neglected.

His hair had been dyed with ochre, once for all—a secret rediscovered in our own day. Pretty women use it now; what disfigured in former times is now thought to embellish. Gwynplaine had yellow hair. This hair-dye, corrosive, apparently, had left it woolly and awry. These tawny bristles, more like a mane than a head of hair, covered and hid a lofty skull, made for purposes of thought. The operation, such as it was, that had taken away all harmony from the countenance, and thrown all this flesh into disorder, had laid no hold upon the bony lid. Gwynplaine's facial angle was surprisingly marked with power. Behind the laugh there was a soul, that dreamed, as we all dream.

For the rest, this laugh was, for Gwynplaine, a definite talent. He could not control it at all; but he derived advantage from it. By means of this laugh he gained his livelihood.

Gwynplaine—as you have, without doubt, already perceived—was that child abandoned, one winter's evening, upon the coast of Portland, and sheltered at Weymouth, in a poor hut upon wheels.

## II.

### DEA.

THE child was now a man. Fifteen years had slipped away. It was 1705. Gwynplaine was twenty-five.

Ursus had kept with him the two children. This had constituted a nomad group.

Ursus and Homo had grown old. Ursus had become entirely bald. The wolf had become gray. The age of wolves is not determined like that of dogs. According to Molin, there are wolves that live eighty years: among others, the small Koupara, *cavia vorus*, and the strong-smelling wolf, *canis nubilus* of Say.

The little girl found upon the dead woman was now a tall personage of sixteen, pale, with brown hair, slight, frail, almost tremulous by reason of delicateness, and causing fear lest one should dismember her, beautiful exceedingly, with eyes full of light, blind.

The fatal winter's night, that had cast down upon the snow the beggar-woman and her child, had dealt a double stroke. It had killed the mother and blinded the daughter.

Amaurosis had forever paralyzed the eyeballs of this girl, in her turn become a woman. In her countenance, across which the light reached her not, the corners of the lips sorrowfully turned downward were expressive of this bitter disappointment. Her eyes, large and clear, were strange in this respect—quenched for herself, they were brilliant for others. Mysterious torches, illumining only what was without. She gave forth light, she who had it not. Those eyes, effaced, were resplendent. Captive of darkness, she whitened the gloomy circle around her. From the depth of her incurable eclipse, from behind the black wall that we term blindness, she jetted forth radiance. She saw not the sun outside of her; and you could see, in her, her soul.

Her dead look had a celestial intensity, that is indescribable.

She was the night; and, from this remediless shade amalgamated with herself, she came out, a star.

Ursus, crazy about Latin names, had christened her *Dea*. He had in some degree consulted his wolf. He had said to Homo—You represent man: I represent the beast. We are the

world below; this little one shall represent the world on high. Such weakness is omnipotence. In this fashion, the universe complete, humanity, bestiality, divinity, will be in our hut.—The wolf had made no objection.

And thus it was that the foundling was called Dea.

As for Gwynplaine, Ursus had no trouble in inventing a name for him. On the very morning of the day, when he had ascertained the little boy's disfigurement and the little girl's blindness, he had asked:—Boy, what's your name? And the lad had replied,—They call me Gwynplaine.

—Gwynplaine let it be! Ursus had said.

Dea assisted Gwynplaine in his exercises.

If human misery could be summed up, it might have been in Gwynplaine and Dea. They seemed to have been born, each in a compartment of the sepulchre; Gwynplaine in the horrible, Dea in the obscure. There was for Gwynplaine, who could see, a harrowing possibility, that had no existence for Dea, being blind: that of comparing himself with other men. Now, in a position like that of Gwynplaine—admitting that he sought to take account of it—to compare himself was no longer to understand himself. To have, like Dea, a void look, whence the world is absent, is a supreme affliction; less, however, than this: to be an enigma to one's own self; to feel also that something is absent, which is one's self; to see the universe, and not to see one's self. Dea had a veil—the darkness; Gwynplaine had a mask—his face. Circumstance unspeakable: it was with his own flesh that Gwynplaine was masked! What his countenance was, he knew not. His face was in a swoon. They had put upon him his mock self. For visage, he had a spiriting-away. The head lived, and the visage was dead. He did not remember to have seen it. The human race, for Dea as for Gwynplaine, was a fact out of themselves; they were far from it. She was alone, he was alone; the isolation of Dea was funereal—she saw nothing; the isolation of Gwynplaine was sinister—he saw every thing. For Dea, creation passed not the bounds of hearing and touch; her real was narrow, limited, short, lost all at once; her only infinite was darkness. For Gwynplaine, to live was to have the crowd forever before him, and forever beyond his reach. Dea was proscribed from light; Gwynplaine was banished from life. The two, unquestionably, might abandon themselves over to despair. The depth of possible calamity was touched. They were in it, he and she alike. An observer, who had seen them, might have felt his musing resolve itself into measureless pity. What must they not suffer? A decree of ill weighed visibly upon these two human creatures; and never had fatality better laid out a destiny of torture and a life of hell, for two beings who had nothing done.

They were in a paradise.

They loved each other.

Gwynplaine adored Dea. Dea idolized Gwynplaine.

—You are so handsome! said she to him.

### III.

"OCULOS NON HABET, ET VIDET."

ONE single woman upon earth saw Gwynplaine. It was this blind one.

What Gwynplaine had been for her, she knew from Ursus, to whom Gwynplaine had told the story of his rude march from Portland to Weymouth, and of the agonies mixed up with his abandonment. She knew that, when quite a little baby, dying upon a dead mother, sucking at a corpse, a being, only somewhat less small than herself, had picked her up; that this being, stricken out, and, as it were, buried under the gloom of universal rejection, had heard her cry; that, all being deaf for him, he had not been deaf for her; that this child, isolated, feeble, cast out, with nothing to lean upon, dragging himself through the desert, worn out with fatigue, broken down, had accepted from the hands of night the burden of another child; that he, who had nothing to expect in the dubious distribu-

tion that is termed fate, had charged himself with a destiny; that, in destitution, in agony, in distress, he had constituted himself a providence; that, Heaven closing itself, he had opened his heart; that, being lost, he had saved; that, having no roof nor shelter, he had been a refuge; that he had made himself mother and nurse; that he, himself alone in the world, had replied to abandonment by an adoption; that in darkness he had set this example; that, not finding himself sufficiently weighed down, he had not objected to another's misery in addition; that upon this earth, whereon it seemed that there was nothing for him, he had fallen upon an object of duty; that there, where all might have hesitated, he had gone forward; that there, where all would have recoiled, he had consented; that he had put his hand into the sepulchre's mouth, and had drawn out her, Dea; that, half naked, he had given his rags, because she was cold; that, hungry, he had thought of making her drink and eat; that, for her so little, he, the little one, had combated death; that he had combated it under every form, under the form of winter and snow, under the form of solitude, under the form of terror, under the form of cold and hunger and thirst, under the form of tempest; that for her, Dea, this Titan of ten years had waged battle with the immensity of night. She knew that he had done this, being a child, and that now, being a man, he was her strength for her who was weak, her wealth for her who was poor, her cure for her who was sick, her eye for her who was blind. Through the dense unknown, by which she felt herself held at distance, she distinguished clearly this devotion, this self-sacrifice, this courage. Heroism, in the region of the immaterial, has a form. She caught this form sublime. She perceived the mysterious outlines of Virtue, within that inexpressible abstraction where dwells the mind unilluminated by the sun. Amid the surroundings of obscure objects set in motion, which was the only impression made upon her by reality—in that unquiet stagnation of the passive creature ever watchful against possible peril—in that sensation of being therein without defence, which is all the existence of the blind—she made out Gwynplaine above her, Gwynplaine never chilled, never absent, never eclipsed; Gwynplaine tender, helpful, gentle. Dea thrilled with this certainty and with gratitude. Her anxiety, reassured, tended to ecstasy; and, from her eyes surcharged with shadows, she contemplated at the zenith of her abyss this goodness, as it were immeasurable light.

In the ideal, goodness is the sun; and Gwynplaine dazzled Dea.

For the crowd—which has too many heads to have a thought, and too many eyes to have a look—for the crowd—which itself a surface, stops short at surfaces—Gwynplaine was a clown, a buffoon, a mountebank, a grotesque creature, a little more and a little less than an animal. The crowd knew nothing but his face.

For Dea, Gwynplaine was the saviour who had picked her up in the tomb, and brought her out thence, the consoler who had made existence possible for her, the liberator whose hand she felt in her own amid the labyrinth of darkness. Gwynplaine was the brother, the friend, the guide, the support, the semblance of one from above, the winged and radiant spouse. There, where the multitude saw a monster, she saw an archangel.

The fact was, Dea, being blind, perceived his soul.

### IV.

THE LOVERS PAIRED.

URSUS, philosopher, understood it. He approved of Dea's fascination.

He said:

—The blind one sees the invisible.

He said:

—Conscience is sight.

He looked at Gwynplaine, and muttered to himself:

— Half monster, but half god.

Gwynplaine, on his part, was infatuated with Dea. There is the invisible eye, the mind; and there is the visible eye, the eyeball. It was with the visible eye that he saw her. Dea was dazzled through the ideal; Gwynplaine, through the real. Gwynplaine was not ugly—he was hideous; he had before him his contrast. By as much as he was terrible, by so much was Dea charming. He was horror; she was grace. There was something of fancy in Dea. She seemed to be a dream partially embodied. There was in all her person, in her Æolian cast, in her delicate and supple figure, tremulous as a reed, in her shoulders perchance invisibly winged, in the discreet rounding of the forms that indicated her sex—though rather to the spirit than to the senses—in her pallor which was almost a transparency, in the solemn and serene introspection of her look divinely closed against earth, in the hallowed innocence of her smile—an exquisite approach to the angelic, while she was none the less sufficiently a woman.

Gwynplaine, as we have said, made comparisons, as regarded himself, and as regarded Dea. His existence, such as it was, was the result of a double and unwonted adoption. It was the intersecting point of two rays, one from below and one from above, one black, the other white. The same crumb perhaps, pecked at simultaneously by the respective beaks of good and evil, the one bringing with it a bite, the other a kiss. Gwynplaine was this crumb, an atom bruised and caressed. Gwynplaine was the issue of a fatality mixed up with a providence. Misfortune had laid a finger on him, and good fortune also. Two widely sundered destinies had made up his wayward lot. Anathema and benediction were upon him. He was the accursed and the elect. Who was he? He knew not. Looking at himself, he saw a stranger. But the stranger was a monstrosity. Gwynplaine lived in a state of decapitation, having a countenance that was not himself. This countenance was horrible, so horrible as to be amusing. It gave rise to so much fear, that it made one laugh. It was infernally ludicrous. It was the wreck of the human face in a bestial mask. Never had been seen upon the human visage a more total eclipse of man; never had parody been more perfect; never had outline more squalid sneered in a nightmare; never had all that could be repulsive to a woman been more hideously amalgamated in a man. The wretched heart, masked and calumniated by the face, seemed forever doomed to solitude beneath the visage, as beneath the lid of a tomb. And yet, not so! There, where some mysterious malice had exhausted itself, invisible beneficence in its turn had been lavish. In this poor down-fallen one, suddenly raised up, it inspired what is attractive, side by side with all that repels; amid dangers it planted a loving nature; it winged the flight of a soul toward the forsaken; it charged the dove to console the thunder-stricken; it caused deformity to be adored by beauty.

For this to be possible, need was that the fair one saw not the disfigured one. For this blessing, this misfortune was requisite. Providence had made Dea blind.

Vaguely did Gwynplaine perceive that he was the object of a redemption. Wherefore the persecution? He knew not. Wherefore the ransom? He knew not. A halo of glory had come and settled itself over the blight that was on him; this was all he knew. Ursus, when Gwynplaine was old enough to understand it, had read and explained to him the text of Doctor Conquest *De Denasatis*, and in another folio, *Hugo Plagon*,\* the passage *nares habens mutilas*; but Ursus had prudently abstained from conjectures, and had specially guarded himself against conclusions of any sort. Suppositions were possible; the probability of violence having been done to Gwynplaine's infancy was glanced at; but, for Gwynplaine, there was only one thing in evidence, the result. His fate, it was to live under a brand imprinted. Why this brand? There was no

answer. Silence and solitude around Gwynplaine. All was shifting, in the conjectures that could be brought to bear upon this tragic reality; and nothing, save the terrible fact, was certain. In this extremity, Dea intervened; a sort of heavenly interposition between Gwynplaine and despair. Touched, and as it were rewarmed, he noted how the sweetness of this exquisite girl leaned toward his hideousness. A paradisaical astonishment softened his Draconian face. Formed to appall, there was for him the marvellous exception of being admired and worshipped by light in its ideal; and, monster himself, he felt that a star was contemplating him.

Gwynplaine and Dea, they were a pair; and these two pathetic hearts adored each other. One nest, and two birds; there is their story. They had reentered into the universal law, which is to love, to seek, and to find.

In such manner, that hate had made a mistake. The persecutors of Gwynplaine, whoever they were—the enigmatical implacableness, come whence it might—had missed their aim. They had desired to make a man abandoned to despair; they had made one enraptured. They had affianced him in advance, to a grievous wound; they had predestined him to be consoled by an affliction. The executioner's pincers had been softly transformed into a woman's hand. Gwynplaine was horrible, artificially horrible, horrible by the hand of man. They had hoped to isolate him forever—from his family in the first place, if he had relations, and from humanity thereafter. A child, they had made of him a ruin; but Nature had reclaimed this ruin, as she reclaims all ruins; Nature had consoled this solitude, as she consoles all solitudes. Nature comes to the rescue of all that is renounced. There, where all is wanting, she rebestows herself in whole; she reflowers and covers again with verdure all that has fallen down; she has ivy for stones, and love for men.

Profound munificence of the shadowy!

## V.

### THE BLUE IN THE BLACK.

Thus, one by aid of the other, lived these hapless ones; Dea supported, Gwynplaine accepted.

This orphan woman had this orphan man. This fragile one had this deformed one.

These widowhoods espoused each other.

An ineffable thanksgiving grew out of these two afflictions. They thanked.

Whom?

The darksome Infinitude.

The mere act of acknowledgment suffices. Thanksgiving has wings, and penetrates where it ought to penetrate. Your prayer goes further lengths than you go.

How many men have thought that they were praying to Jupiter, and have prayed to Jehovah! How many believers in amulets have been heard by the Infinite! How many atheists fail to perceive that, by the sole fact of being good and sorrowful, they are praying to God!

Gwynplaine and Dea were grateful.

Deformity is expulsion. Blindness is a precipice. The expulsion was adopted; the precipice was habitable.

Gwynplaine saw coming down to him in full light—in an ordering of destiny that resembled the setting forth of a dream—a white cloud of beauty in woman's form, a radiant vision wherein was a heart; and this apparition, half cloud and woman notwithstanding, clasped him, and this vision embraced him, and this heart favored him. Gwynplaine, being loved, was no longer deformed. A rose asked a caterpillar in marriage, perceiving in this caterpillar the paragon butterfly. Gwynplaine, the rejected one, was chosen.

To have what is essential—that is every thing. Gwynplaine had his; Dea had hers. The abjectness of the disfigured one, alleviated and as it were made sublime, dilated itself in exal-

\* Vereio Gallica, Will. Tyrus, lib. 2, chap. 38.

tation, in ecstasy, in faith. The sombre hesitation of the blind one in her darkness was met by an outstretched hand.

It was the entry of two miseries into the ideal, this one absorbing that one. Two excluded ones gave each other admission. Two voids combined to fill each other up. They laid hold of that which was wanting. Where one was poor, therein the other was rich. The misfortune of one made the other's treasure. If Dea had not been blind, would she have chosen Gwynplaine? If Gwynplaine had not been disfigured, would he have preferred Dea? She would probably have liked deformity no better than he would have liked infirmity. What happiness for Dea, that Gwynplaine was hideous! What luck for Gwynplaine, that Dea was blind! Outside of their providential watching each other, there was impossibility between them. A prodigious need, one of the other, was the basis of their love. Gwynplaine saved Dea; Dea saved Gwynplaine. A meeting of afflictions, resulting in adherence! The embrace of the engulfed in the abyss! Nothing more contracted, nothing more desperate, nothing more exquisite!

Gwynplaine had one thought:

— What should I be, without her?

Dea had one thought:

— What should I be, without him?

These two banishments led up to one country; these two incurable fatalities—the brand upon Gwynplaine, and Dea's blindness—effected their junction in contentment. They were all in all to each other; they imagined nothing beyond themselves. To converse together was a delight; to draw near each other was bliss. By force of mutual intuition, they had reached a unity of ideas; they two thought the same thought. When Gwynplaine walked, Dea imagined that she heard a step in an apotheosis. They leaned one against the other in a sort of sidereal twilight, full of perfume, of glimmerings, of music, of luminous architecture, of dreams. They belonged each to the other. They felt that they were united forever, in the same joy and in the same rapture. Nothing so strange as this construction of an Eden by two of the condemned.

They were inexpressibly happy.

Out of their hell they had made a heaven. Such, O Love, is thy power!

Dea heard Gwynplaine laugh; and Gwynplaine saw Dea smile.

Thus an ideal felicity was found; the perfect joy of life was realized; the vague problem of happiness was solved. And by whom? By two poor wretches.

For Gwynplaine, Dea was the "splendor." For Dea, Gwynplaine was the "presence."

The presence, profound mystery, which makes the invisible divine, and whence results that other mystery, faith. In religions, there is this only of irreducible. But this irreducible suffices. One sees not the great being essential to our existence; one feels it.

Gwynplaine was Dea's religion.

Sometimes, distracted with love, she threw herself on her knees before him, as it were a fair priestess adoring the full-blown gnome of a pagoda.

Picture to yourself the bottomless pit, and in the midst of it an oasis of brilliancy, and in this oasis these two beings, beyond this life, bedazzling each other.

No purity comparable to that of these love-passages. Dea knew not what a kiss was, albeit perhaps she desired it, for blindness, especially in a woman, has its fancies, and, though trembling at the approaches of the unknown, does not shrink from them all. As for Gwynplaine, the emotions of youth made him pensive. The more he felt himself fascinated, the more timid was he. He might have ventured to any lengths with this companion of his early years; with her who was as unfamiliar with sin as with light; but he would have thought himself to be stealing what she might have given. He resigned himself, with complacent melancholy, to loving in angelic

fashion, and the sense of his deformity resolved itself into dignified bashfulness.

Such was this idyl, growing out of a tragedy.

## VI.

### URSUS TUTOR, AND URSUS GUARDIAN.

URSUS had been, for Gwynplaine and Dea, almost a father and a mother. Murmuring all the time, he had reared them; scolding all the time, he had nourished them. This adoption having made the hut upon wheels heavier, he had been obliged to harness himself more frequently with Homo, to drag it.

Let us add that, after the first few years, when Gwynplaine was almost grown up and Ursus was quite old, it had been Gwynplaine's turn to drag Ursus.

Ursus, seeing Gwynplaine grow bigger, had cast the horoscope of his deformity.—They have made your fortune! was his remark.

This family, of an old man, two children, and a wolf, had become—with all their prowling about—a group more and more closely bound together.

The wandering life had not prevented education. To wander is to thrive, said Ursus. Gwynplaine was evidently made to be exhibited at fairs. Ursus had cultivated in him the mountebank; and in this mountebank, to the best of his ability, he had incrustated learning and wisdom. Ursus, arrested before the dumb-foundering mask of Gwynplaine, muttered: "A good beginning has been made of him." That is why he had finished him off with all the ornaments of philosophy and knowledge.

Often did he repeat to Gwynplaine—Be a philosopher! To be wise is to be invulnerable. Such as you see me, I have never wept. Strength of my wisdom. Do you think, if I had desired to weep, that I should have lacked an occasion?

Ursus, in his monologues, whereto the wolf was a listener, remarked:—I have taught Gwynplaine every thing, Latin included, and Dea nothing, including music. He had taught them both to sing. He had himself a pretty talent upon the wheaten pipe, a tiny flute of that day. He played it agreeably enough, as also the *chiffonie*, a mendicant's hurdy-gurdy, which the chronicle of Bertrand Duguesclin terms, "instrument Fuand," and which is the starting-point of symphony. This music attracted the populace. Ursus showed the *chiffonie* to the crowd, and said:—In Latin, *organistrum*.

He had taught Dea and Gwynplaine singing, according to the method of Orpheus and of Egide Binchois. It occurred more than once that he cut short his lessons, with this cry of enthusiasm: Orpheus, musician of Greece! Binchois, musician of Picardy!

These complications of a careful education had not so far occupied the two children as to hinder them from adoring each other. They had grown up, commingling their hearts, just as two saplings planted near together, in becoming trees, mingle their branches.

— It's all the same, murmured Ursus; I'll marry them.

And he grumbled aside:

— They bore me with their love.

The past—the small portion that was theirs at least—had no existence for Gwynplaine and Dea. They knew, concerning it, just what Ursus had told them. They called Ursus, "Father."

Gwynplaine had no remembrance of his childhood, but as of the passing of demons over his cradle. He had an impression of it, as of having been stamped upon, in darkness, by deformed feet. Was this done purposely, or involuntarily? He did not know. What he recalled clearly, and in its every detail, was the tragic adventure of his abandonment. The godsend of Dea made for him, out of that terrible night, a radiant point of time.

Dea's recollections were still more obscure than Gwynplaine's. Having been so young, all had passed away. She recalled her mother as something cold. Had she ever seen

the sun? Perhaps. She tried hard to replunge her mind into the swoon that was behind her. The sun? What was it? She remembered an indescribable something, luminous and warm, that had been replaced by Gwynplaine.

They conversed in low tones. Certain is it that to coo is the most important thing in the world. Dea said to Gwynplaine:—The light, it is when you are speaking.

## VII.

## BLINDNESS GIVES LESSONS IN CLAIRVOYANCE.

At times, Gwynplaine reproached himself. He made of his happiness an affair of conscience. He fancied that to let himself be loved by this woman, who could not see him, was to deceive her. What would she say, if her eyes were suddenly opened? How would she be repelled, by what now attracts her! How would she recoil before so horrible a lover! What a shriek! What hands covering her face! What a plight! A harassing scruple tormented him. He said to himself that he, a monster, had no right to appropriate love. Hydra, worshipped by a star, it was his duty to enlighten this blinded luminary.

Once he said to Dea:

—You know that I am very ugly?

—I know that you are sublime, was her reply.

He continued:

—When you hear everybody laughing, it is at me that they laugh, and because I am a horrible object.

—I love you, said Dea.

After a pause, she added:

—I was in death; you brought me back into life. With you there, heaven is at my side. Give me your hand, that I may touch Divinity.

Their hands sought and clasped each other; and they said never more a word, rendered silent by the plenitude of loving.

The crabbed Ursus had overheard them. The next day, when they were all three together, he said:

—Besides, Dea is ugly also.

The words failed in their effect. Dea and Gwynplaine were not listening. Absorbed in each other, they seldom paid attention to Ursus's apothegms. Ursus was profound, and at a dead loss.

This time, however, the warning of Ursus, "Dea is ugly also," indicated in that learned man a certain knowledge of woman. Gwynplaine, without doubt, had committed, in all loyalty, an act of imprudence. Said to a very different woman, and to a very different blind person from Dea, the expression "I am ugly," might have been dangerous. To be blind, and to be in love, is to be doubly blind. In that situation, one dreams. Illusion is the nourishment of dreams; to deprive love of illusion is to take away the food on which it lives. All enthusiasm enters, usefully, into its formation; physical, no less than moral, admiration. Furthermore, one should never, with a woman, use an expression difficult to understand. She dreams over it; and often she dreams ill. An enigma in a dream makes havoc. The percussion of a word, that is let fall, disintegrates what adheres. It happens sometimes that, one knows not how, because it has received the chance-shock of a casual word, a heart becomes void insensibly. The being, who loves, is conscious of a diminution in his bliss. Nothing is to be feared so much as this slow trickling out from a cracked vase.

Fortunately, Dea was not of this clay. The stuff for making womankind in general had not served for her. A rare nature was Dea. The body was fragile; the heart not. What was at the very root of her being, was a divine perseverance in love.

All the mischief, wrought upon her by Gwynplaine's expression, led to making her say to him, one day, these words:

—To be ugly, what is that? It is to do evil. Gwynplaine does nothing but good. He is handsome.

Then, always under that form of interrogation familiar to childhood and blind people, she went on:

—To see? What do you call seeing, you others? I do not see, I; I know. It seems that to see means to conceal.

—How do you mean? asked Gwynplaine.

Dea answered:

—To see is something that hides the truth.

—No! said Gwynplaine.

—Yes, I tell you, replied Dea, since you tell me that you are ugly!

She thought a moment, and added: Liar!

And Gwynplaine had the dear delight of having avowed, and of not being believed. His conscience was at ease; his love also.

Thus had they reached, she sixteen years, he twenty-five.

They were not, as one would say now, more advanced than in the first day.

Their caresses went not much beyond hands pressed.

Twenty-five years, and sixteen! This brought it about that, one morning, Ursus, not losing sight of his "bad turn," said to them:

—One of these days you will choose a religion.

—For what purpose? asked Gwynplaine.

—To be married by.

—But that's done, replied Dea.

Dea did not understand how they could be husband and wife, more than they were.

In the main, this chimerical and virginal contentedness, this ingenuous satiating of soul by soul, this celibacy, taken for marriage, was not displeasing to Ursus. What he said of it was said, because he was bound to say something. But the physician within him found Dea, if not too young, at least too delicate and too frail for what he termed "hymen in the flesh and bone."

That would always come soon enough.

Besides, were they not married? If the indissoluble existed anywhere, was it not in this cohesion, Gwynplaine and Dea! Rare circumstance, they were adorably cast into each other's arms by misfortune! And as though this first bond were not sufficient, love had come to attach itself to misfortune, to be enveloped in it, to be closely bound to it. What force could ever break the iron chain, made firmer by the knot of flowers!

There, in truth, must be the inseparables.

Dea had beauty, Gwynplaine had sight. Each brought a dowry; and they made more than a couple—they made a pair, kept apart only by innocence; a sacred interposition.

Nevertheless, it was in vain that Gwynplaine went on dreaming, and absorbed himself so far as he could in contemplation of Dea, and in the spiritual tribunal of his love; he was man. There is no eluding the laws of fatality. He underwent, as does Nature throughout all her immensity, the secret workings ordained by the Creator. This, at times when he appeared in public, made him eye the women who were in the crowd; but he turned away immediately this untoward look, and hastened to reënter, repentant, into his inner self.

Let it be added, that encouragement was wanting upon the countenances of all the women at whom he looked; he saw aversion, antipathy, repugnance, rejection. It was clear that, for him, none other but Dea was possible. This aided him in his repentance.

## VIII.

## NOT HAPPINESS ONLY, BUT PROSPERITY.

How much truth there is in fables! Remorse for an evil thought is the searching touch of an invisible devil.

In Gwynplaine's case, the evil thought was not yet hatched, and he never felt remorse. But, occasionally, he felt regret.

Vague film of conscience!

What was there in it? Nothing.

Their good fortune was complete. So complete, that they were no longer even poor.

Between 1689 and 1704, a great change had taken place.

It happened sometimes, in this year 1704, that, at nightfall,

a large and heavy caravan, drawn by two strong horses, made its entry into such or such small sea-coast town. It was like the hull of a vessel turned upside-down, the keel for roof, the deck for floor, and set upon four wheels. The wheels were all of the same size, and no higher than those of stone-carts. Wheels, pole, and body—all was painted in green, with a rhythmical gradation of shades, varying, from bottle-green on the wheels, to apple-green on the roofing. This green color had ended by setting a mark upon the vehicle; and it became well known wherever fairs were held. They called it the Green-Box. This Green-Box had only two windows, one at each end, and a door behind, with steps. Above the roof, from a funnel painted green like the rest, issued the smoke. This peripatetic house was always newly varnished and freshly washed. In front, upon a bracket-seat attached to the vehicle, and with access to it through the window, above the horses' hind-quarters and by the side of an old man who held the reins and managed the team, two trolloping women of the gypsy tribe, costumed as goddesses, sounded the trumpet. The wonder-stricken citizens stared at and commented upon this machine, as it rudely jolted about.

It was the old establishment of Ursus, amplified by success, and promoted from a mountebank's stage to a theatre.

An animal, something between dog and wolf, was chained under the caravan. This was Homo.

The old whip, driving the hacks, was the philosopher himself in person.

Whence came this expansion of the miserable hut into an Olympian car?

From this fact: Gwynplaine was a celebrity.

It was with a sagacious foresight of that which is success among men, that Ursus had said to Gwynplaine:—They have made your fortune!

Ursus, it will be remembered, had made Gwynplaine his pupil. Unknown persons had worked upon the visage. He himself had worked upon the intelligence; and, behind the mask so successfully wrought, had inserted all that he could of thought. So soon as the child, grown bigger, seemed to him worthy of it, Ursus had brought him upon the stage, that is to say, upon the front board of the hut. The effect of this appearance had been extraordinary. All in a moment, the passers-by had admired. Nothing comparable to this surprising mimic laugh had ever been seen. No one knew how the miracle of communicable hilarity had been obtained. Some thought it natural, some artificial; and, conjecture being added to reality, everywhere, in the public places, in the markets, in the various stations of fair and fête, the crowd flung itself upon Gwynplaine. Thanks to this "great attraction," a shower had fallen into the poor money-box of the wandering group—first of farthings, then of pennies, and finally of shillings. One field for curiosity exhausted, they passed on to another. The rolling stone does not grow rich, but the rolling hut does: and thus from year to year, from town to town, with the growth of Gwynplaine's figure and of his ugliness, the fortune came that Ursus had predicted.

—What a service they rendered you there, my boy! said Ursus.

This "fortune" had allowed Ursus, the administrator of Gwynplaine's success, to have the vehicle of his dreams constructed; that is to say, a caravan large enough to carry a theatre and sow science and art in the public squares. Further still, Ursus had been enabled to add to the group composed of himself, of Homo, of Gwynplaine, Dea, two horses and two women, the latter of whom were goddesses in the troop, as we have just remarked, and servants. A mythological frontispiece was useful in those days, to a mountebank's booth.—We are a wandering temple! said Ursus.

These two trolloping women, picked up by the philosopher in the nomadic pell-mell of towns and suburbs, were ugly and young, and were called, by decree of Ursus, the one Phœbe, and

the other Venus. Read: *Fibi* and *Vinos*, seeing that it is proper to conform to English pronunciation.

Phœbe did the cooking, and Venus scrubbed the temple.

Furthermore, on the days of performance, they dressed Dea.

Outside of what constitutes—for mountebanks as for princes—public life, Dea, like Fibi and Vinos, wore a Florentine skirt in flowered stuff, and a woman's hooded cape, which having no sleeves, left her arms free. Ursus and Gwynplaine wore men's hooded capes, and large shoulder-knots, like seamen in the navy. Gwynplaine had, in addition, for his exercises and exhibitions of strength, a leather pelerine round his neck and over his shoulders. He took care of the horses. Ursus and Homo took care of each other.

Dea, from being accustomed to the Green-Box, came and went in the interior of that rolling house, quite at her ease, and as though she could see.

An eye that could have penetrated into the recesses, and noted the arrangements of this travelling abode, might have perceived in one corner—fastened to the wooden sides and immovable upon its four wheels—the old hut of Ursus, put upon the retired list, having permission to rust, and henceforth exempted from rolling, as Homo from dragging.

This hut, set up in the back corner on right of the door, served as chamber and dressing-room for Ursus and Gwynplaine. It contained, now, two beds. In the opposite corner was the kitchen.

The arrangement on shipboard is not more compressed and precise than was the internal parcelling out of the Green-Box. Every thing therein was fixed, set in its place, provided for, designed.

The caravan was divided into three compartments, partitioned off. The compartments communicated by openings, without doors. A piece of stuff, let fall, closed them in a manner. The rear compartment was the men's lodging; the front compartment was the women's lodging; the middle compartment, separating the two sexes, was the theatre. The orchestral instruments and the accessories were in the kitchen. A loft under the arch of the roof contained the scenery; and, by opening a trap-door in the loft, lamps were unmasked that produced magical effects in lighting.

Ursus was the poet of these enchantments. He it was who got up the shows.

His were varied talents; he had special juggler's tricks of his own. Besides the voices that he made you hear, he brought out all sorts of unexpected things, abrupt transitions from light to darkness, spontaneous formations of ciphers or words at will upon the partition, lights and shadows mingled with the fading away of figures, and many another oddity, in the midst of all which, inattentive to the gaping crowd, he seemed to be meditating.

Gwynplaine had said to him one day:

—Father, you have the air of a magician.

And Ursus had replied:

—This comes, perhaps, from my being one.

The Green-Box, constructed according to a skilful diagram by Ursus, had one ingenious refinement. Between the two fore and hind wheels, the central left-hand panel worked upon a hinge by means of an adjustment of chains and pulleys, and could be lowered at will like a drawbridge. As it was lowered, it set at liberty three props, also on hinges, which, remaining vertical while the panel was down, set themselves upright upon the ground, like the legs of a table, and upheld above it, as it were, a stage, the panel converted into a platform. The theatre was at the same time disclosed, enlarged by the platform which made the front of its stage. This opening—according to the out-of-doors Puritan preachers, who turned away from it with horror—absolutely resembled a mouth of hell. Probably it was for an impious invention of this kind that Solon had Thespis cudgelled.

Thespis, moreover, has lasted longer than is believed. The

theatre on wheels still exists. It was upon movable boards of this sort that, in the sixteenth and seventeenth centuries, they represented, in England, the ballets and the ballads of Amner and of Pilkington; in France, the pastorals of Gilbert Colin; in Flanders, at the *faïra*, the double choruses of Clement, called Non-Papa; in Germany, the Adam and Eve of Thailes; and in Italy, the Venetian shows of Animuccia and of Ca-Fossia, the Sylva of Gesualdo, Prince of Venousa, Laura Guidiccioni's "Satyr," the Despair of Philenus, "Ugolino's Death," by Vincent Galileo, father of the astronomer, the which Vincent Galileo sang his own music, accompanying himself on the viol di gamba, together with all those first attempts at Italian opera, which, after 1580, substituted free inspiration for the madrigal style.

The caravan, in its color emblematic of Hope, that bore Ursus and Gwynplaine and their fortunes, and at the head of which Fibi and Vinos trumpeted like a brace of Fames, was a link in all this grand chain, Bohemian and literary. Thespis would no more have disavowed Ursus, than Congris would have disavowed Gwynplaine.

On their arrival upon the public places in town or village, and in the intervals of Vinos and Fibi's flourishes, Ursus commented upon the trumpets, with instructive revelations.

—That symphony is Gregorian, he cried. Fellow-citizens, the Gregorian sacramental rite—that grand advance—has run a tilt in Italy against the Ambrosian rite and in Spain against the Mozarabic rite, and has only triumphed over them with difficulty.

After which, the Green-Box came to a halt on some spot of Ursus' choosing; and in the evening, the panel stage-front was lowered down, and the performance began.

The theatre of the Green-Box represented a landscape, painted by Ursus, who didn't know how to paint; by reason of which, when required, the landscape could do duty as a subterranean vault.

The screen, that which we call the curtain, was a blind made of silk with variegated squares.

The public was outside, in the street, in the open place, grouped in a semicircle around the show, under sunlight, or under sudden showers, an arrangement that made rain less desirable for theatres of that time, than for those of to-day. As often as they could, they gave representations in the court-yard of an inn. Hereby, they had as many tiers of boxes as there were rows of windows; and thus also, the more cramped the theatre, the larger the paying public.

Ursus figured everywhere in the piece, in the *tronpe*, in the kitchen, in the orchestra. Vinos beat the kettle-drum, the sticks of which she handled marvellously; and Fibi thrummed the *morache*, a sort of gittern. The wolf had been promoted to be "utility man." He was decidedly a member of the company, and played occasionally the odds-and-ends of a part. Often, when they appeared side by side upon the stage, Ursus and Homo, Ursus in his bear-skin lightly laced, Homo in his wolf-skin better adjusted still, one could not make out which was the beast. This flattered Ursus.

## HOW WE DROWN AND ARE RESUSCITATED.

BY DR. CHARLES LANCASTER.

TO the unlearned my caption may seem to involve a solecism, because it is generally considered that, when a man has been submerged in water for any indefinite time—from two minutes to half an hour, or for a time longer than a person can ordinarily hold his breath—he must necessarily be drowned and dead, and resuscitation is hopeless. This is not, however, the case.

My object in this article is briefly to explain the cause and the process of drowning, whether partial or complete, and also to add a few sensible as well as scientific hints, as to the best mode of restoring the patient. It is to be observed, at the outset, that the human lungs, like the lungs of all terrestrial and air-breathing animals, are the or-

gans by means of which the blood is purified of its carbon and other deleterious substances, and preserved in a condition fit for free and easy circulation throughout the system. This circulation is necessary for the purposes of nutrition, and, with its coördinate function of respiration, is indispensable for the maintenance of life.

Now, the lungs, under ordinary conditions, are never, during life, wholly exhausted of atmospheric air. We will suppose that, with each expiration or expulsion of the air from the lungs, almost two-thirds of the whole volume inspired, or taken in, are expelled, the remaining one-third being retained, to be exchanged, in the next inhalation, for its equivalent of fresh air. This provision possesses the twofold merit of providing a ready means of expelling any foreign body which, by accident, may temporarily obstruct the passage of the trachea or wind-pipe (as when one swallows a substance "the wrong way"), and of keeping constantly in store a supply of air sufficient for the decarbonization of so much blood as shall pass through the lungs under a retarded circulation, caused by a temporary deprivation of fresh air.

It will now be easily comprehended that, if, in the ordinary healthy condition, as much as two ounces of blood pass through the lungs from the heart at every pulsation, and if about one inspiration of fresh air suffices for the purification of as much blood as passes the lungs in four pulsations, in the same ratio will a less quantity of air complete the decarbonization of a less quantity of blood under the retarded circulation which is inseparable from the condition of a drowning person. I have already hinted at the cause; now let us examine the process of drowning.

By a wise and beneficent provision of Nature, at the moment of submergence in water, and consequent exclusion of air from the lungs, the circulation of the blood is checked or retarded; and here comes the point of special interest. The sudden plunge into cold water is invariably accompanied by a gasp for breath. By this act the lungs are well filled with fresh air. The head is now submerged, and the breathing stopped. But there is an ample supply of air for the new condition, provided it be not too prolonged. And the time which this condition may safely be endured depends solely upon the quantity of air the submerged person carried down with him. The demand is reduced in exact ratio with the supply, and the difficulty is to know precisely at what point the supply shall fail; for, of course, the moment the last available cell of the lungs has given up its oxygen for the combustion of the carbon presented to the lungs, Death seals the victim for his own; because the carbon and other waste matter accumulates so rapidly in this little laboratory of life, and requires so constantly to be discharged, that, the moment the air is wholly exhausted, the blood loses its stimulating power, the diaphragm ceases to contract, respiration is impossible, and life is extinct.

By one other curious means, a similar condition of the person about to plunge under water may be secured, so that, in lieu of the *gasp* which fills the lungs with fresh air at the moment he so much needs it, both the circulation and respiration are instantly checked and reduced to their minimum of movement. I refer now to a blow on the top of the head at the moment of submergence. By this concussion of the brain a paralyzing effect is distributed throughout the nervous system, involving, of course, the nerves of all the muscles and tissues concerned in the acts of respiration and circulation. In this case, as in the former, the unlucky diver is reduced to a state analogous to that of the hibernating animal during his long and solitary winter repose, the only real difference being that the latter still breathes, which the former does not.

Now, the common theory of drowning is at fault in the two following particulars: First, it supposes that, because one has been under water for some time, he must necessarily be filled with water, and that this causes death, when the fact is that, the moment access to air is denied, the little guard called the epiglottis closes over the orifice of the larynx and prevents the entrance of the water; just as it does in the act of swallowing, to prevent the food from going down the "wrong way." Place a live chicken in a jar of carbonic acid gas, and you will have a good illustration of a drowning person. Again it is erroneously supposed that, because one has been under water for a considerable time, and there are no outward manifestations of life, vitality must be extinct. On the contrary, persons have been restored to life after submersions of three-quarters of an hour.

There can be little doubt that numerous persons who have died have been rescued from the water in ample time to have been

resuscitated if the proper means had been employed, and there is no period short of that which causes the muscles to give up their great vital principles of irritability and contractibility, where any hesitancy should be allowed in applying the best remedies at hand. When these functions of the muscles are once lost, the case, of course, is hopeless.

Now, as to the best method of resuscitation. If the drowned person is not filled with water, it is evident there can be little advantage in holding him up by the heels as is too commonly done; indeed, this treatment must be attended with considerable peril to the patient, supposing there is remaining any movement of the blood at all. Necessarily that position forces the blood to the head, thereby increasing the congestion of the brain, already present as the result of the suspension of the breath.

Another interesting, perhaps, but not very philosophical mode of treatment is to roll the patient over a barrel, as if he were drowned only in the bowels, and it was expected that, by dislodging the enemy at that point, the citadel of life would soon be recovered. Doubtless the most salutary treatment of a drowned person consists in placing him on his back in a half-reclining position, and keeping up a lively friction of the extremities with warm flannels, at the same time turning him gently and constantly from side to side, in order to put in motion the resident air in the lungs, for if this can be accomplished the diaphragm will contract, an inhalation may be looked for, and life saved. If these means fail, tickle the nose with a feather, or inject a little snuff into the nose, and follow this with the inflation of the lungs by the use of the bellows. Take a new or clean common hand-bellows, insert the nozzle into one orifice of the nose, close the other, close the mouth with the hand, and now slowly and carefully force the air from the bellows into the lungs, and immediately expel it again by a gentle pressure of the hand on the breast. If, after a repetition of this experiment a few times, there is no sign of life, you may consider the case hopeless.

## MAGNOLIAS.

THE magnolia-tree, so beautiful for its leaves and flowers, so valuable for the wood of many of its varieties, is much less known and appreciated than many others not nearly so ornamental or so useful. To Pierre Magnol, who was prefect of the Montpellier Botanic Garden from 1688 to 1715, belongs the honor of giving his name to the genus. It embraces some ten distinct species, of which the magnolia proper, with its wax-like flowers, and the tulip-tree, with its buds streaked with green and pink, are the most conspicuous in North America. Many Americans, however, are more acquainted with the dwarfed varieties which come to us from China and Japan, than with the pride and glory of our own forests. The tulip-tree flourishes in the North, but the grand magnolia is peculiar to the South, growing in South Carolina and Georgia, and reaching its perfection in the fertile soil of Mississippi and Louisiana. But we will first describe the more humble varieties. The glaucous-magnolia is certainly one of the loveliest shrubs of North America. It is at home anywhere from Cape Ann, in Massachusetts, to Florida and Louisiana, and generally cared for under its common name—sweet-bay. In sheltered situations it is a little tree, about twenty feet high, but usually in the North it is a small shrub, with many stems growing from the same root. In the low country of South Carolina, it sometimes grows forty and fifty feet high. The small stems are erect, smooth, and of a bright-green color when young. The leaves are a shining, dark green, and fall in autumn. The flowers are at the extremities of the branches, and, from May to August, contrast richly with the crisp and abundant foliage. The blossoms do not appear so early in the North, where they may not be looked for before July. There are from eight to fourteen petals to the flower, which is of a creamy white, very fragrant, turning yellowish on fading. The bud-enclosure has three leaves. The fruit is a cone, consisting of numerous cells, which open for the escape of bright scarlet seeds, each suspended by a thread.

These cone-shaped seed-cases, in another species, give the

name to the cucumber-magnolia, in which the fruit exactly resembles the little green cucumber used in pickling. This variety is a tree, sometimes exceeding eighty feet in height, and measuring four feet in diameter, at a yard from the ground. The leaves are six or seven inches long, and half as broad. The flowers are five and six inches in diameter, slightly fragrant, the petals expanding but little, and yellowish white, with a bluish tinge on the outside. This tree is majestic, and of perfect symmetry in form. Its much-prized wood is fine-grained, and takes a high polish. It is more durable than the yellow pine.

A more beautiful tree is the auricle-leaved magnolia, which grows from thirty to forty feet high. Its leaves are from eight to twelve inches long, and its white flowers from three to four inches in diameter, with a pleasant odor. The wood is light and spongy, and not now used. It may, at some period, prove a poor substitute for cork.

The brown-flowered magnolia is merely a shrub, three or four feet high, with evergreen leaves of an elliptical, oblong shape. The flowers are small, very fragrant, and of a dull-purple color. It is a native of China, but with us it is a greenhouse plant, and the companion of the camellia.

There are three varieties of the Japan shrub, marked by red-purple, purple-white, and pure-white flowers.

The species which grows on the island of Nippon, reaches the height of ten feet, and its rough bark smells like camphor.

The umbrella-magnolia is remarkable for its great leaves. It grows to the height of thirty and forty feet, and trunk and branches are covered with a white bark. The leaves grow from the ends of the delicate branches, and are three feet long, and seven or eight inches broad. Growing pendent in tufts of three and four, they are an excellent sun-shade. The flowers, when fully expanded, are eight to ten inches in diameter, white, with a purple spot inside. A variety of this, only less wonderful for the size of its leaves and flowers, is found in the Atlantic and Middle States. The lofty-magnolia (*Magnolia excelsa*) is a native of Nepal, where it grows from fifty to eighty feet high. It is the fine yellow wood called *champ* in joinery.

The Yulan-magnolia, of China, is remarkable for the number and the delicious perfume of its blossoms. It reaches a height of eight or ten feet, and blooms about the middle of April, the flowers appearing before the leaves, and completely covering the tree. A specimen mentioned in Downing's "Rural Essays," was grafted upon an American species. In 1850 it was fourteen years old, and twenty feet high, and at one time there were three thousand blossoms at once upon its branches.

But the stateliest of all is the Southern species, or *Magnolia grandiflora*. It is the most remarkable of all the trees of North America for the majesty of its form, magnificence of foliage, and beauty and fragrance of its flowers. It often rises to the height of seventy and eighty feet, even more, with a naked, smooth, columnar stem. If its head or crown of green has not been injured by tempest, it is always regularly pyramidal, or semi-elliptical. From May until August it is covered with its brilliant white flowers, terminating the younger branches. Its leaves are entire, oval, evergreen, and very brilliant on their upper surfaces. The flowers are often seven or eight inches broad, and their pure white, like delicate wax, forms a most charming contrast with the bright-emerald background. It is often called the big laurel, and its seeds are a vivid red, three or four, longitudinally arranged in cells. It grows from seeds, or from shoots or layers, which require two years to make roots capable of transplanting. It will not thrive north of New York, on account of the cold, but is now cultivated in England, France, and Italy. Its most remarkable characteristic is its perfume, which is the same as that of the yulan and the sweet-bay. The nearest earthly approach to what we suppose Paradise was, is in riding along a dusty road in Mississippi or Louisiana, to suddenly plunge into the cool depths of a magnolia forest. They are rare, for the planter has coveted the deep mellow soil which alone can feed the great bitter roots,

and the axe has killed them to make way for cotton. The saw-mill, too, is their foe. They still exist, however, interlacing their green pyramids so as to defy the sun, and forming a cool,

the delicate cane-reeds, while the dwarf-magnolia bends its flower-laden boughs almost to the reach of the hand, and the *grandiflora* lifts its verdant pyramids on the gentle slopes. That

Gathering Magnolia-blossoms in the South.

damp shade, such as Lebanon may have known in its glory. But Lebanon must have wooed and won a rose of Sharon to bloom on each drooping spray, before it could equal this forest, shining as the sunbeams glance through the polished leaves—blooming like a great garden with flowers delicate as camellias and larger than roses—while the warm summer air is voluptuous with the sweetest of earthly perfumes.

Another point from which to see this prince of trees to advantage, is from the numerous lagoons and bayous which vein the maps of Mississippi and Louisiana. The boat glides over the glassy water to the beach, and the foreground is fringed by

silent perfumed air, cooled by the breath of the water, seems the very atmosphere of love.

## ON THE INVOLUNTARY MOVEMENTS OF ANIMALS.

BY DR. MICHAEL FOSTER, OF UNIVERSITY COLLEGE, LONDON.

### II.

#### USES OF THE VIBRATORY CILIA.

OBSCURE as may be the efficient cause of ciliary action, its final cause, its purpose is, in most cases, obvious and clear. You have

seen that, on the pieces of frog's throat, the cork invariably travels in one direction. In the natural position of the membrane that direction is toward the frog's stomach. The air-tubes of our own lungs are lined by a similar ciliated membrane, and in them the direction of the movement is also uniform, viz., upward toward the throat. In this way the mucus which is continually being secreted by the air-tubes, is as constantly being carried upward out of the lungs. But for this, a mere cold would be sufficient to choke any one of us, through the accumulation of mucus in the lungs. Allow me here to call your attention to the beautiful and mysterious harmony in which these little cilia work together. The tiny stroke of a little hair, one-fourth of an inch in length, could of itself effect but little. It is because there are so many of them, and because they all work together, that they are able to produce such bold, visible effects as the movements of pieces of cork or of mucus. We have reason to think, as we have seen, that the movements of the cilia of any given cell are not only produced, but ordered in and by the cell itself. In an isolated cell we may see the cilia not only at work, but working in harmony and rhythm. It is only when the cell grows faint at death that the individual cilia work irregularly, some being at rest, others in action; some working one way, some another. So long as the cell is strong and sound, so long do all the cilia work, and work together. On the surface of each cell there are generally several rows of cilia. The cilia of each row strike in unison, but the stroke of any one row is, in point of time, a little before that of the one, and a little behind that of the other, of its two immediate neighbors, so that the stroke passes in a wave across the cell, like a wave of the wind passing over a field of corn—passes over, too, in one direction only, that direction being determined by the necessities of the part, or of the animal, of which the cell is a microscopic member. If I were to scrape, for instance, the surface of one of these frog's throats, and to put the drop of mucus I carried away with the point of a knife under the microscope, I should, on examination, be a witness of the ciliary action of many isolated cells, and, in most cases, I should be able to declare, concerning each cell, which was the side nearest the mouth, and which the side nearest the stomach, because I could see the direction of the ciliary stroke, and that stroke I know to be from the mouth to the stomach. In each isolated cell the cilia work in harmony, but two cells whose natural bond has been severed may be working at different times, though working close together and almost touching each other. In the body, however, cell touches cell with a living touch, and the rhythm of the beat of each cell is pitched to harmonize with all its fellow-cells. Were it not so, did each cell follow out its own devices, the result would be a mass of eddies, a whirl of confused currents. You have seen that, even in the separated membrane, the ciliary stroke, as betokened by the cork which moves so steadily, is grandly uniform. And that uniformity, be it observed, is carried on without, as far as we know, any coördinating mechanism. No one has ever discovered any nervous apparatus to regulate the multitudinous cilia of any membrane. It would seem as if each cell just felt, by its primeval protoplasmic sensibility, the throb of its neighbor-cells, and as if that throb were the key-note by which all its own molecular processes were pitched.

I have spoken so far only of the cilia of the frog's throat, and of our own air-tubes, where the labor of the cilia is at best but an ignominious task. In many animals, however, their office is an honorable one, and their importance supreme. Time would fail me were I to attempt to give even a mere sketch of the manifold purposes wrought out by cilia in the economy of animal nature. To many, to very many creatures, it is the chief, to some the only, means of respiration. The lashing cilia constantly renew the water in contact with the general surface of the body, or circulate it through internal cavities, or pass it in due order among and between special organs, as, for instance, through the curiously-constructed gills of the oyster. Many animals live solely on the food brought to them by the whirl of ciliary currents, having no organs of prehension at all, and very many, though able otherwise to eat, gain a supplement of food in the same way. Other animals, again, have no other organs of locomotion but cilia; all the waters of the globe, from the great sea down to the roadside puddle, are full of wee creatures, which row themselves about by the rhythmic sweep of these tiny oars. And a still larger number of animals, in whose adult life ciliary action has but a feeble share, are found in their earliest days to be dependent on cilia for their power to move from place to place. In the grown-up frog the cilia are almost entirely confined to its mucous membrane; but the young

tadpole is clothed with ciliate cells from head to tail, and, before it has grown its long lashing tail, cilia, and cilia alone, form at once its means of breathing, moving, and feeding.

Were I to discuss all these multifarious instances of ciliary action with the fulness of detail that I have spent upon the frog's throat, I should be telling very nearly the same tale over again. In all cases, the work, the structure, the life-history, would be very nearly the same. In all we should see the same spontaneous rhythmic labor springing mysteriously out of the inner working of some transparent structureless tissue, either gathered into individual masses called cells, or spread in an unbroken layer over the surface of the body. In all we should see the movement exactly adapted to some special purpose, the position and form of the cilium, the direction, the force, the character, the time of the stroke, all bearing toward the one end. In all we should find the movement, though thus the result of hidden, deep-seated molecular motions, with its features ordained and fixed for a settled purpose, subject nevertheless to many influences, capable of being quickened, retarded, or suspended, by this or that change in outward circumstances. All this we might see and learn, and yet not be able, even with the highest powers of the most modern microscope, to catch so much as a glimpse of any structural machinery by which we might think ourselves able to explain the facts.

#### THE LIVING CREATURES IN OUR BLOOD.

And now let me direct your attention for a little while to an animal movement of another kind, but still of an involuntary nature.

If you examine under the microscope a drop of recently-drawn blood, you will see scattered among the many red corpuscles a few colorless, transparent bodies, called white corpuscles. These possess no very particular structure. They are pale, transparent, dotted over with refractive granules of various sizes, and in the centre of each is hidden a more solid round kernel, or *nucleus*. Not much else can be seen in them. Examined when the blood is first shed, they appear spherical; but, if you watch one of them attentively for a few minutes, you will see that a bulging or protuberance makes its appearance at one point of the circumference, and gradually increases up to a certain limit. The appearance is not due to any bursting of the sphere; the continuity of outline is perfectly maintained. The impression on the mind is as if the mass of the corpuscle were semifluid or viscid, and had flowed out in that particular direction; and one can easily satisfy one's self that what is gained at the point of bulging is lost elsewhere. The phenomenon is merely a change of form.

The movement thus first witnessed is slowly succeeded by other similar bulgings. The corpuscle, from being spherical, becomes, perhaps, pear-shaped; then, it may be elliptical; a little later on, quadrangular; after that, star-shaped, and so on. In fact, so long as the corpuscle can be kept alive, so long will it continue, minute after minute, to shift its form by flowing out, now in this direction, now in that. Not only does it thus shift its outline, but the very change in form readily becomes a change of place. If a bulging flows out to the right, say, and the whole body follows the protuberance, the result is a locomotion—a sidling to the right. And, by repeated manœuvres of this kind, the little organism travels through appreciable distances.

This particular kind of movement has received the name of *amoeboid*, because it is exhibited on a much larger scale, and may be witnessed with much greater ease, in that interesting class of animals—lower down, as is said, in the scale of creation—of which the common amoeba is a well-known instance. In these creatures we are forced to admit the essentially vital character of the movement. At first sight, it seems strange that such things as blood-corpuscles—mere fragments of the body of an animal—should possess the power of independent movement and locomotion; and one is naturally led to think that the changes of form and place witnessed in a drop of shed blood are due to mere physical causes, are simply the result of changes of density or other inorganic processes going on in the fluid part of the blood. All attempts, however, to explain the phenomena in this way, though they have repeatedly been made, have, as yet at least, signally failed. Moreover, the amoeboid movements are influenced by circumstances very much in the same way as are ciliary and ordinary muscular movements. They last only so long as the animal, or the part which manifests them, continues to live. They are quickened by warmth, and retarded by cold. They are possible only within certain limits of temperature. They are subject to suffocation, to the action of anæsthetics, of chemical agents, and of poisons. They are

influenced by electricity. In fact, they are so like in their history to ciliary action on the one hand, and to muscular contraction on the other, that one can hardly resist the conviction that all these are but members of one class, bound together by the common possession of some fundamental vital quality. Should it seem bold to speak of the kinship of the projection of an amoeboid protuberance, which perhaps takes minutes in the making, with the sharp, swift bend of a cilium, which is over and gone in a fraction of a second, allow me to remind you that time, like size, has but little differential value to a physiologist. Should it, on the other hand, seem too great a stretch to consider the undefined creeping of unformed protoplasm as of like nature with the smart, well-ordered action of curiously-constructed muscle, let me briefly put before you the essentials of the one and of the other.

#### HOW THESE LIVING CREATURES MOVE.

If we examine under the microscope one of the large amoebae of our fresh-water pools, we find that it is not homogeneous, but composed of an inner court and an outer zone. The inner court is somewhat fluid, and is crowded with granules; the outer court, though semi-fluid, has more solidity, is perfectly transparent, apparently perfectly homogeneous, with hardly a speck on the surface or in its substance; looking, in fact, for all the world like a band of molten glass. It is in the outer zone that the movements begin and are executed; the inner court of granules does but passively follow where the outer zone leads. And, looking attentively at the outer zone, one cannot help feeling convinced that its material is plastic in nature, like, as I said just now, molten glass; and that, in obedience to some inner working, it rises and falls in waves, now in this direction, now in that. These waves we call its movements.

And now let me ask you what takes place when a muscle contracts. It shortens, but also widens, at the same time and to the same degree. And what is true of the muscle is also true of each of the constituent elementary fibres. Each fibre widens as it shortens. When we examine under the microscope a single fibre engaged in the act of contraction, the widening is more easily seen than the shortening. The widening, in fact, seems to run along the fibre; or, in other words, a wave of, so to speak, lateral bulging sweeps through its length. In the ordinary contraction of a vigorous muscle, these muscular waves flow with amazing rapidity, but exhaustion and coming death diminish their velocity; and sometimes, in exhausted, ill-nourished, or dying muscles, the progress of the wave is so impeded, that, under particular treatment, the wave will last for many seconds, and is visible to the eye in the form of a weal, known under the technical name of the *idio-muscular contraction*.

Amoeboid movements and muscular contractions are, then, but waves of an irritable plastic material, and, so far, are alike; but they differ in two fundamental points: amoeboid waves are slow, muscular waves are quick; in this respect, muscle has the advantage over protoplasm. But there is a compensation—the amoeboid wave moves in all directions of space; the muscular wave is limited to one. Protoplasm is all-sided; muscle can do no more than bring its two ends together. What is gained in force and time is lost in character—the old tale, written large and often in the book of animal life.

If, then, we may regard amoeboid movements as essentially muscular in character, there comes to us in reference to them, as it did in reference to cilia, the question, What and where is the irregular stimulus which sets these movements going? To this we can only bring the same indefinite answer as before. The stimulus of the amoeba and of the white blood-corpuscle is, in most of the movements we witness, not from without, but from within; internal changes are the chief causes which disturb the equilibrium of rest.

Certainly, at least the equilibrium, the spherical-balanced state of the white corpuscles which circle in the blood-currents of our bodies, can be disturbed by no direct stimulus proceeding from our wills. They are independent, indeed, of the nervous system altogether.

But it would be hazardous to assert that all amoeboid movements are outside the grasp of nervous action. White blood-corpuscles are not the only elements of even our bodies which enjoy this protoplasmic power. As to what extent similar amoeboid movements go on, and what share they hold in the production of the total life of the economy, one cannot speak at the present moment with decision or authority; for the matter is a new one, and just now undergoing careful examination. But, most probably, inquiry will result in enlarging rather than in diminishing our present views of the importance of

these movements; and it is very likely that investigation will bring out many instances of their at least indirect control by the nervous system, and thus possibly by the will.

#### REMARKABLE CUTANEOUS CHANGES.

One such instance we may already claim. Frogs, as you are possibly aware, like chameleons, vary in color from time to time, being at one period, perhaps, of a light-yellowish green; and at another, of almost a coal-black, or of some shade intermediate between the two. This change is brought about by means of certain pigment-cells (cells filled with black granules), scattered over the skin. Each pigment-cell is capable of changing its form. It may exist either as a little round black dot, with the black granules gathered up into a heap, or as a straggling many-branched star, with the granules strewn through all the branches, or in any possible shape intermediate between these two. The transition from one form to another we may look upon as an amoeboid movement, though it differs somewhat from the manifestations of a white blood-corpuscle, since, as it is probable, the cell itself does not so much change in form, as the granules change their position in the cell, running to and from the centre, from and into the various branching paths. When the granules are gathered in the centre, we see only a small round dot; when most of the granules are away in the branches, we see a straggling blackish patch.

But, whatever be the exact nature of the change, this at least is evident, that when the black granules are concentrated into heaps, we see more of the natural abiding green or yellow-green color of the skin, and we say that the frog is pale. When, however, the granules are scattered in broad ramified patches, they hide much more of the natural permanent color, and the frog appears to us dark or black, and so with intermediate stages.

Now the point to which I wish to draw your attention is this, that the condition of these pigment-cells, whether they are to be dots or broad patches, concentrated or diffuse, is determined (whether directly or indirectly I do not venture to decide) by the action of the nervous system. By operations upon the spinal cord and other parts of the nervous system, we can to a certain extent make the whole or a part of a frog dark or pale as we please; we can concentrate or diffuse its pigment-cells by nervous action. Nay, more, this color of the skin is intimately connected with one particular part of the nervous system. The frog, like the chameleon, though to a more limited extent, wears its colors according to the sky. He is black when it is dull or dark, pale when it is bright. The color of his skin is affected by the quantity of light. And the light works chiefly, perhaps wholly, not by acting directly on the skin, but by an indirect influence through the medium of the optic nerve. Destroy the sight of a frog, and he becomes forthwith coal-black, unless some other exciting causes intervene. Thus between the pigment-granules of the web, say, of the frog's foot, and the light coming from the sun, there is in constant operation a line of communication, the links of which are the retina, the optic nerve, the spinal cord, and certain nerves of the leg.

Time will not allow me to pursue this subject further. I will only remind you of the common experience of grooms, that blind horses do not wear their coats as do horses which can see (so striking is the difference that many men will know a blind horse at the first glance a long way off), and I think you will agree with me that there are probably many ties in living beings yet to be revealed by physiology, and that in these amoeboid movements of protoplasm there may lie solutions of problems with which at present they seem to have nothing whatever to do. I might put before you, perhaps, the yet larger reflection that the "too, too solid flesh" over which Hamlet lamented, is forever quivering and vibrating with perpetual movements. I think I may venture to suppose that few of you, looking at these pieces of seemingly dead skin, would think that they contained within them springs of continual motion, such as those of which the pieces of cork have made us aware. The microcosm of the animal body is like the macrocosm.

The heavens, at first gaze, seem full of the intensest quiet and rest; yet we know that they overflow with perpetual motion and toil. So, to the diligent observer, pieces of seeming dead membrane, bits of skin, drops of blood, all fragments almost of living bodies, come to be seen as spheres of unrest and labor. We may see, if we do but look, the shuttle of life flying to and fro in the tiniest morsel of living stuff.

## SKETCHES OF EARLY LIFE IN BOSTON.

## No. VI.

## HOW THEY REGULATED TRADE IN BOSTON.

TRADE, for the most part, thrives best when it is left to regulate itself. The *maximum* of prosperity is secured by the *minimum* of legislation. To undertake to settle by law how long a man shall work, and how much he shall work for; to determine what percentage of profit a trader may take, and to foster by protection one class of interests at the expense of another, is to violate the fundamental principles of sound political economy.

Now we will see how our early friends in Boston tried to manage their financial affairs.

In August, 1630, the wages of a master carpenter were fixed at sixteen pence per day, if meat and drink were also provided; "of the second sort of workmen," at twelve pence per day; and a fine of ten shillings was imposed upon both giver and receiver, if any thing above this was paid. Common laborers were forbidden to take above twelve pence per day, or six pence with food.

The next year these orders were rescinded, the presumption being that the good gentlemen who passed the law had now got their houses built, and ceased to have any personal interest in the matter.

But, after the lapse of one more year, the restriction upon wages was renewed, it being considered that the rates of compensation, which had risen to three shillings a day for carpenters, and two shillings and sixpence for laborers, had become excessive. It was urged that, with such pay as this, men could earn enough in four days to support them through the week; and, of course, it might be expected that the other two days would be passed in idleness and indulging in the use of tobacco and liquor, "which was a great waste to the Commonwealth."

It must have been somewhat hard upon mechanics, not only to have their wages cut down, but also to be liable to be disposed of after the manner indicated in the following enactment: "Whereas, Mr. Cullimar, servant to Mr. A. Mellowe, is employed in public service in making carriages, ordered, that John Humfry and John Endicott shall have power to *press any other carpenter* to supply the need of Mr. Mellowe, in lieu of his said servant."

For some reason, of which we are not informed, it was determined to withdraw brass farthings from circulation, and introduce something else in their place; whereupon it was "ordered that *musket-bullets* of a certain bore pass currently for farthings a piece, provided that no man is obliged to take above twelve pence at one time." We should hope not; forty-eight good-sized old-fashioned bullets would be about as much small change as a man would wish to carry in his pockets.

A unique kind of legislation is seen in the case of Mr. John Eales, who is "ordered to be placed in some convenient place for bee-hive making; the town to make up what his work wanteth of defraying the charge of his livelihood." A great many people would be glad to practise their trade on like conditions.

During the first four years, from the settlement of Boston, there were no shops for the sale of goods; but, if it was known that a citizen had in his possession a superfluity of any articles, over and above what he needed for the use of his own family, he would be called upon at his residence, and an offer made for the purchase of the same.

Neither was there any separate inn or ordinary, until the year 1634, when a tavern was opened by Samuel Cole, and John Coggan established a shop. At the same time the court passed an order for the "erection of a *marcate*."

A very unwise restriction upon trade is seen in a law prohibiting the purchase of any commodity from vessels arriving

at Boston, without express permission from the governor and some one of the assistants. Under such circumstances, it must have been all-important for retailers to be on good terms with the authorities; and, if human nature was the same then as it is now, it would not be strange if a pound of tea or a dozen of Malaga occasionally found their way to the gubernatorial mansion, as a kind remembrance from the grocery.

We are sometimes a little perplexed by the various schemes proposed in and outside of Congress for increasing our national revenue—one man declaring that the larger our debt the richer we are, because it is due to our own people; another man asserting that we have only to change our "promises to pay" into promises *not* to pay, with the general understanding that the latter shall be regarded as legal tender just as much as the former, and then we cease to have any debt at all; and *most* men seeming to think that the particular branch of business in which they happen to be engaged is the one which the public good demands should be free from onerous taxation.

On a small scale, we find indications of the same sort of financial sagacity in the times of our fathers.
